THE wide publicity given by the daily press to the equipment, progress, and disastrous failure of the *Jeannette* expedition has made its chief features household words. Two publications emanating from survivors of the wreck have already been noticed in these columns. With catholic impartiality, the great journal to whose proprietor the expedition was due, has given place in its columns to every fact, statement, or opinion which offered any light on the subject. Quite recently the report of the board of inquiry into the circumstances of the loss of the vessel has been issued. Now the wife of the ill-fated commander has published selections from his journals, preceded by a biographical chapter, and supplemented by a condensed account of the search which followed the rescue of the survivors. A brief review of these two publications, with some consideration of the bearing of the expedition on Arctic exploration, is in order.

From a bookmaker's point of view, a criticism on the two volumes of Mrs. De Long, which presents itself at once, is their excessive weight. The matter might easily have appeared in one volume of comfortable size. The maps are wretchedly executed. With these reservations the dress of the work is attractive, and the illustrations worthy of the pains bestowed upon them. The notes on the early life of De Long, leading up, though with some noticeable gaps, to his selection for the expedition, are interesting, but in no way remarkable. His chief characteristic from the beginning seems to have been a dash and energy which refused to consider obstacles, whether admirals, cabinet ministers, or ice-floes. This does not appear to have been accompanied by unusual intellectual ability or studious disposition, though the style of the extracts from his journal is that of a man able and accustomed to express himself with clearness and propriety. The account of the cruise on the *Little Juniata* steam-launch in Baffin's Bay indicates better than any other single episode in the book his courage and ability as a naval officer; though it is absurd to regard it, as has been done, as in any sense a preparation for Arctic work. This ten days' cruise seems to have turned De Long's attention to Arctic matters. In 1873 he proposed to Mr. Bennett, then a stranger to him, to undertake an Arctic "expedition to the North Pole." This phrase seems to express tolerably well De Long's idea of Arctic exploration; at least, so far as the testimony of these records avails us, there is no more lucid statement of his aim and object. Personal acquaintance followed his application, and the *Jeannette* voyage was the ultimate though long-delayed result.

It is unnecessary to recount that history in detail. The party was selected by the commander, and its record bears testimony to his judgment of men. It would be invidious to particularize among the living, but none who have followed the story of the voyage can have failed to recognize the moral qualities and professional abilities of De Long's officers, particularly, perhaps, in the case of the surgeon of the expedition. If to these qualities had been added that experience in meeting the conditions of the Polar region which association with its native people in their primitive condition alone can effectually give, very different might have been the outcome. Or, without this experience, if the leader had had any grasp of the Arctic problems long awaiting solution, other than the primitive notion of discovering an imaginary point on the earth's surface, or registering additions to the Arctic shore lines, all this noble blood might not have congealed in vain. Perhaps it should not be said in any case that these men died in vain, for the moral lesson of patient, heroic endurance which they left us is beyond price. But, from any other point of view, it still remains true,

humanly speaking, that their lives were uselessly sacrificed. Perhaps the most touching figure in it all is that of the warm-hearted, hot-headed Collins, who, devoted to his favorite study, forsook the pleasant places of a metropolitan city, accepted a nominally menial station, and dared the well-known perils of the icy north, the discomforts of association with those who could not share his enthusiasm for a specialty; who, unaccustomed to routine, chafing under an unsympathetic discipline, saw the instruments of his research placed beyond his reach, his plans frustrated, and his endeavors made fruitless—in the end, denied even the poor privilege of aiding his comrades in their daily labor; his anticipations blasted; gnawed by famine; yet lying down uncomplainingly to die.

This we do not learn from Mrs. De Long's book, which has naturally taken the form of a eulogy rather than a history. The record of disagreeable things, as between the commander and his people, has been expunged, if it existed in his journal, and this it would be hard to censure. It is not here that one would be justified in looking for unbiassed criticism. Nevertheless the work unconsciously but effectively testifies to the defective preparation of the man for his task. After four months' experience he is forced to "believe that this ocean is subject to tidal action" (p. 204), and less egregious evidences of ignorance are not rare. Evidently to the tidal literature of the Polar Sea he had never given a thought, and supposed that an ocean could exist without a tide. It is to be hoped that better physics are now taught at Annapolis. It is also beyond question that De Long was hampered by the worst failing which can affect an explorer—namely, a want of adaptability. Great in his eyes was discipline, not as a means but as an end. He could not be conveniently blind on proper occasions, nor could he yield the execution of his orders, under rapidly changing circumstances, to anything less than the impregnable forces of nature. He did not know what it was to have a sliding scale of action or to meet nature half way. For this he is not to be blamed. It was his constitution, his education, his misfortune, but not his fault; and if it had been, he paid the forfeit like a man.

Of a different character is the report of the Court of Inquiry. In form, it is an ordinary public document, enriched with several maps, good, bad, and indifferent, of which only one, that of Nindemann, has anything more than an historical value. The Court was convened to "diligently and thoroughly investigate the circumstances of the loss" of the *Jeannette*, and of the death of De Long and others, and to inquire into "the general conduct and merits of each and all the officers and men of the expedition." Here, if anywhere, we might expect to find a plain unvarnished statement of all the facts attainable, from which to form a judgment as to the real causes of the failure of the expedition to produce tangible results or to save the lives of its members.

The first item, that of the loss of the ship, forms a safe subject of inquiry. No rational being could expect any vessel once fixed in such a moving pack to emerge unharmed. This is treated at great length. The circumstances of the search are fully recited, showing that everything possible was done by the survivors to succor their unfortunate comrades, and the most hypercritical could reach no ground for fault-finding in that particular. But it was noticed at the time by those interested, and is fully confirmed by the printed report, that great care was taken to suppress any testimony which seemed likely to lead in certain directions. The court really took the place of a coroner's inquest on the bodies of the dead. In one sense the responsibility of the commander for the death of his men was the chief question at issue; yet the testimony to the survivors, of one who did not survive, supposed to bear on this branch of the subject, was repeatedly excluded on the ground that it was "hearsay evidence." Whatever the truth might have been, this mode of proceeding shows no desire to get at it; and it does not seem unsignificant that the log-books, as well as the private journals of De Long and Collins, though "considered by the court," do not appear in the record, and have not, in an unmutilated state, been made accessible to the public anywhere. It may have been desirable that private squabbles, if any, should rest in their obscurity; but the way in which this result should have been reached was by frankly limiting the scope of the inquiry, and not by suppressing evidence on mere technicalities.

De Long, it may be hoped, was the last pole-seeker. That style of exploration among qualified experts is happily obsolete. Yet on those who most clearly see the folly of such headlong, unsystematic attempts is likely to be visited the public opprobrium they have excited. Rational investigation will doubtless be stifled for a time, because some rash spirits have parodied the duel of the bull and the locomotive. Nothing is more certain than that the investigation of the physics of the Polar area must be continued, and that it can only be properly carried on in a scientific spirit. Hitherto Arctic expeditions have been of two kinds: one scientifically planned and almost invariably fruitful in results, without loss of life; the other ministering to public notoriety or national vanity, expensive, pseudo-scientific, and not rarely disastrous. If a quietus has been given to the latter by the miseries witnessed on the Lena delta, those sufferings will not have been in vain.

CHILDREN'S BOOKS.

THE spirit of Plutarch is the one thing wanting in Rosalie Kaufman's adaptation called 'Our Young Folks' Plutarch' (Lippincott). The book has been thoroughly elaborated: there is no patchwork, no excerpting, about it. It is scholarly enough: other sources besides Plutarch have been drawn upon. The writer's style is unexceptionable in itself considered, without, however, being specially adapted to the youthful reader, so that occasionally it runs the risk of being unintelligible. But the flavor of the old Greek historian is all gone; and in spite of Miss Kaufman's desire to offer "lives, and not a history," she has failed in this very particular. She is not, we are forced to infer, a natural lover of biography; she is, we dare say, a very earnest historical student. To say this is to say that she is out of sympathy with her model. Still, let us recognize the difficulties of the task, and let us hasten to admit that children will find themselves interested in the present abstract, in happy ignorance that the personality of Plutarch himself has eluded them. Something more was their due, which could even now be supplied in a future table of contents—a simple statement of the periods at which the historical characters, at least, flourished. The omission of dates in the case of Cæsar, for example, leaves the child's perspective vague where it ought especially to be clear, considering all that has grown out of the conquest of Britain, to say no more. There are a few mediocre illustrations and several excellent classical maps in this handsomely printed volume.

A capital story-teller is the Rev. Lal Behari Day, whose 'Folk-Tales of Bengal' (Macmillan) is not ostensibly addressed to children, and was probably compiled as a serious contribution to the study of folk-lore. Like all Oriental fiction, however, with its astonishing fertility of invention and its endless surprises, these tales have an irresistible attraction for the young, and there is nothing in them—from bigamy to burying alive—which need keep them out of hands to which the 'Arabian Nights' is allowed. The grotesque outweighs the bloody; and neither are the few ghosts calculated to make children nervous or sleepless, nor even the anthropophagous Rakshashas, who are, after all, represented as a rather stupid kind of demon. There are twenty-two of these stories.

'Two Years at Hillsboro' (Lippincott), by Julia Nelson, is a very weak, trashy story of life at a girls' boarding-school, where the pupils were ill trained, the teachers underbred, and where impudence and audacity were at a premium. Indeed, the author seems really to admire effrontery in young girls. There is a great deal of most trivial chit-chat, unworthy of being written or printed, and the book in general has a hopeless lack of tone. It is needless to describe faults of style *per se* where the subject-matter is so objectionable.

It is a refreshing change to turn to Mr. Edward Eggleston's 'Hoosier Schoolboy' (Scribners), a serial from *St. Nicholas*. It would be hard to find a more vigorous and well-told story of schoolboy life. The whole book is instinct with manliness and right feeling. Jack, the hero, is a brave, intelligent, and resolute lad, whose unfolding character reveals all the germs of a noble manhood. With no love of fighting, he fights pluckily when occasion calls, yet never fails to estimate rightly the finer quality of moral courage. Perhaps he shows too mature decision for his years, but that one error may be forgiven to the idealism of the author. The accounts of the different games played by the Hoosier schoolboys are a marked feature of the book, and ought to furnish valuable hints for amusement to boy-readers unfamiliar with them, especially those fortunate ones who enjoy country freedom and space. The incidents of the story are admirably varied, and all full of interest. In short, the book is an eminently delightful one.

Mr. James Otis's 'Tim and Tip,' first published as a serial in *Harper's Young People*, is a very amusing and also pathetic little story, which must please all children, especially boys, between six and twelve years of age. Tim is an orphan who runs away from bad treatment; Tip, the homely but faithful dog so fondly cherished by his young master. There is nothing objectionable in the book, unless we except the bad grammar, which seems to be considered indispensable in portraying illiterate people, or the failure to emphasize the parental carelessness which permitted small boys to carry fire-arms and camp out for several days and nights without supervision.

A new volume of the second series of Mr. Scudder's "Bodley Books" tells of 'The Bodleys in England' (Houghton, Mifflin & Co.). Some items of interest can be gleaned from it by patience and perseverance; and those cautious purchasers whose special aim is to avoid placing anything injurious before the eyes of youth will welcome its advent. But the boy or girl of spirit (from a literary point of view) will prefer instruction less diluted, entertainment more spicy. The style, meant to be easy, lapses occasionally into carelessness. The illustrations are fair.

'The Ball of the Vegetables, and Other Stories, in Prose and Verse' (Harper & Bros.), by Margaret Eytinge, is a collection of pieces which have already appeared in different juvenile magazines. They are bright, charming, and generally merry; some showing much wit and

ingenuity, others very kindly and delicate feeling. The wit, to be sure, as well as some of the finer touches, is sometimes over the heads of children, but this will not interfere with their enjoyment. There is but little to find fault with, though in this age of irreverence it seems superfluous ever to place old people before young eyes in a ridiculous light, even in a funny story —*vide* "Ned Morningstar's Locomotive." The book is rather more suitable for girls than for boys, and some of the stories will delight little readers and listeners in the nursery.

Italian Byways. By John Addington Symonds. Henry Holt & Co. 1 vol. 8vo.

THIS book is made up of sketches of minor Italian places, intermingled with essays on historical crimes of the sixteenth century, which have no connection whatever with its title, and, to our thinking, form one of its greatest blemishes. Not that they are poorly done, for Mr. Symonds is always a charming writer, and thoroughly conversant with the subjects he treats. But these repulsive crimes, which were common not only in Italy, but everywhere among the courts and feudal nobility of Europe in that age, make a jarring and discordant note among the artistic and poetic descriptions of the scenery of the Italy of to-day. As we have pointed out in other more serious works of Mr. Symonds, he seems prone to morbid delineations of lust and crime, even in the most inopportune times and places. Passing over these, we select as a specimen of his descriptive powers the following passage portraying the ill-fated island of Ischia:

"Casamicciola is a village on the north side of the island, in its centre, where the visitors to the mineral baths of Ischia chiefly congregate. One of its old-established inns is called La Piccola Sentinella. The first sight on entrance is an open gallery, with a pink wall on which bloom magnificent cactuses, sprays of thick-clustering scarlet and magenta flowers. This is a rambling house, built in successive stages against a hill, with terraces and verandas opening on unexpected gardens to the back and front. Beneath its long, irregular façade there spreads a wilderness of orange trees and honeysuckles and roses, verbenas, geraniums, and mignonette, snapdragons, gazenias, and stocks, exceeding bright and fragrant, with the green slopes of Monte Epomeo for a background and Vesuvius for far distance. There are wonderful bits of detail in this garden. One dark, thick-foliaged olive, I remember, leaning from the tufa over a lizard-haunted wall, feathered waist-high in huge acanthus leaves. The whole rich orchard ground of Casamicciola is dominated by Monte Epomeo, the extinct volcano which may be called the *raison d'être* of Ischia; for this island is nothing but a mountain lifted by the energy of fire from the sea basement. Its fantastic peaks and ridges, sulphur-colored, dusty-gray, and tawny, with brushwood in young leaf upon the cloven flanks, form a singular pendant to the austere but more artistically modelled limestone crags of Capri. No two islands that I know, within so short a space of sea, offer two pictures so different in style and quality of loveliness. . . .

"Evening is divine in Ischia. From the topmost garden terrace of the inn one looks across the sea toward Terracina, Gaeta, and those descending mountain buttresses, the Phlegræan plains, and the distant snows of the Abruzzi. Rain-washed and luminous, the sunset-sky held Hesper trembling in a solid green of beryl. Fireflies flashed among the orange blossoms. Far away in the obscurity of eastern twilight glared the smouldering cone of Vesuvius—a crimson blot upon the darkness—a Cyclop's eye, bloodshot and menacing.

"The company in the Piccola Sentinella, young and old, were decrepit, with an odd, rheumatic, shrivelled look upon them. The dining-room reminded me, as certain rooms are apt to do, of a ship's saloon. I felt as though I had got into the cabin of the *Flying Dutchman*, and that all these people had been sitting there to meat a hundred years, through storm and shine, forever driving onward over immense waves in an enchanted calm."

Mr. Symonds here grazes a peculiarity of the Italians, that, unlike other people who go to the spas for amusement under the pretext of health-seeking, they prefer resorts where sick people do not congregate. We recall the exclamation made by several members of a fashionable club in Naples when the natural beauties of Ischia were extolled: "Yes, it is an enchanting spot, but who wants to live in a hospital!"

The book abounds in word-painting of remarkable power, and the "Spring Wanderings," "May in Umbria," "A Venetian Medley," "The Gondolier's Wedding," and, above all, the "Winter Nights at Davos," are pages worthy of the author's scholarly and æsthetic reputation.

Moses Mendelssohn. Ungedrucktes und Unbekanntes von ihm und über ihn. Bearbeitet und herausgegeben von M. Kayserling. Leipzig. 1883.

THIS pamphlet forms a supplement to the author's 'Moses Mendelssohn: sein Leben und seine Werke . . . nebst einem Anhange ungedruckter Briefe, etc.,' which appeared about twenty years ago. It contains a number of letters written by the Jewish philosopher to friends and admirers—some of them translated from the original Hebrew—several letters addressed to him, and a few incidents in his life. As a supplement to a life and letters which reveal the character, the standing in German literature, and the peculiar religious attitude of the author of 'Phädon' and 'Jerusalem'—whom the more enlightened of his coreligionists called the third Moses, likening him to the son of Amram and the son of Maimun, while orthodox Jews decried him as a heretic, and Christian adorers saw in him a modern Socrates—this little collection is interesting enough, reflecting as it does, *in parvo*, the most salient and antithetical features of the man who was at once a bold philosophical thinker, a literary reformer, and a sincere Talmudist Jew. Readers unfamiliar with Mendelssohn's writings and his position between the school of Lessing and the synagogue, will find in these letters and other trifles nothing but incongruities, out of which no decently consistent character can be constructed. To them most of the contents will appear enigmatic or strangely odd. A part of the explanation, however, lies in the age, in which liberal thought pierced through all restraint, while the practice, in state and society, was still all but mediæval. Thus, as to ideas which we are inclined to look upon as outgrowths of agitations originating with the French Revolution, it is interesting to read the following remarks of Mendelssohn—in a letter written to Isaac Iselin in 1766—on a line of Beccaria's 'Dei delitti e delle pene,' borrowed from his French guide, Rousseau:

"A fugitive note of this writer has caused me no little astonishment. He alludes, in passing, to the right of property, and adds the following words in parenthesis: 'Droit terrible, et qui n'est peut-être pas nécessaire.' Strange! Have the sophistries of the great philosopher penetrated so far that one is ready to speak so contemptuously of the most beneficent right of human society? We pardon a genius for driving, in a mental revel, a paradoxical thesis through all its sequences, and declaring (in order to prove that the arts and sciences have done nothing for the good of mankind) that property and the entire social order are altogether unnecessary. But to adopt these conclusions confidently, and cite them in passing as fully established, in a work which is to teach man his rights and duties, shows, I think, no ordinary haste. He who does not know the wild theories which make a sensation in our day must regard the whole line as a misprint."

The following incident in the life of the Berlin philosopher illustrates the lingering mediævalism of those days. In August, 1876, Mendelssohn, in company with his wife and his friend Friedländer, visited Dresden. Early on the morning after their arrival, an employee of the Jewish congregation called upon them and collected twenty groschen toll money, which, as Jews, they were bound to pay into the treasury of the Saxon capital. Hastening to the pass-office, he delivered the toll, and entered the names of the travellers. "Mendelssohn," said the officer on duty; "methinks I have heard of this 'Mauschel.' Is he not a writer of books?" "And of what books!" exclaimed the Jew. "What does it matter?" replied the toll-gatherer; "a Jew is a Jew." Next day Mendelssohn visited the Electoral library, where the learned librarian Dassdorf was charmed to see him. Asked how he liked Dresden, the philosopher expressed his pleasure at much that he had seen in Saxony, but, after some hesitation, alluded to the strange equality established by the Electoral laws between travelling Berlin Jews and imported Polish cattle. Dassdorf heard of the toll affair with dismay, muttered some words of exculpation, and, as soon as his visitor left, rushed breathlessly to his friend Baron Ferber, a liberal Saxon statesman, and, like himself, an ardent admirer of Mendelssohn. Ferber lost no time in informing a member of the Saxon Cabinet of the affair, and next morning the College of Finances received an Electoral rescript ordering them to return the twenty groschen to "the Berlin scholar of Mosaic faith, Herr Moses Mendelssohn," and to inform him that he and his party could stay in Dresden as long as they liked, without paying for the permission.

Les États-Unis de Colombie; Précis d'histoire et de géographie physique, politique et commerciale. Par Ricardo S. Pereira, Secretaire de Légation de 1re classe, ex-Délégué du Gouvernement de Colombie au 3me Congrès Géographique International. Paris. 1883.

SEÑOR PEREIRA'S object in writing this book was twofold: to counteract prejudices propagated by light-minded travellers, chiefly French, against the young commonwealths of South America, politically and socially considered, and to offer "to geographers, travellers, and merchants" a connected tableau of each of the nine States of his native Republic. Most of the book is devoted to the latter object, and is executed with great care, symmetry, and neatness. The whole is divided into five parts, of which the first presents a brief history of Colombia. The second treats, in separate divisions, of its geographical position, orography, hydrography, climate, population, etc., and, in a supplement contributed by Dr. Gutierrez Ponce, of races, fauna and flora, and mineral resources. The third, embracing more than half of the entire work, sketches the nine States in alphabetical order—Antioquía, Bolívar, Boyacá, Cauca, Cundinamarca, Magdalena, Panamá, Santander, Tolima—each under the separate heads of "Name, formation, situation," etc., "General physiognomy," "Population," "History," "Social and political conditions," "Agriculture, industry, commerce," "Roads and means of transportation," "Natural curiosities," and "Administrative divisions," to which are added a map of the State, a dictionary of communes, and a table of populations in 1881. A general statistical résumé of the financial, commercial, and maritime relations of the Republic forms the fourth part. The fifth embraces alphabetical notices of celebrated Colombians, and a bibliography, historical and geographical. A handsome colored map of Colombia (and Ecuador) is prefixed to the title-page.

Señor Pereira does not enter into a direct refutation of false assertions concerning his country-

men in the wider or the narrower sense. He combats aspersions and prejudices mainly by the warmth with which he speaks of the great deeds of the South American struggle for independence, of the barbarities perpetrated by the Spaniards on the champions of freedom, and of the advances made by his country in the path of reform and material and moral improvement. His patriotic fervor and animated diction—in fluent and forcible, though here and there slightly unidiomatic, French—are indeed very pleasing and calculated to win favor, especially as he conceals none of the crimes which stain the careers of the greatest of his own heroes, and almost apologizes for justly branding the cruel misdeeds of the Spaniards, from the conquest down to the day of Ayacucho, which sealed the independence of South America. But his own narrative of post-revolutionary events in Bolívar's Republic of Colombia—which included Venezuela and Ecuador—in the centralized Republic of New Granada (1831-1861), and the present United States of Colombia, into which triumphant federalism in 1861 transformed New Granada, strongly controverts his patriotic optimism: an optimism in marked contrast to the tone in which that veteran South American statesman, Sarmiento, recently summed up the results of his lifelong experience (see the *Nation* of July 19).

The Liberator, Bolívar, himself barely escaping assassination in 1828; Padilla, "the Colombian Nelson," executed as a conspirator by his command; Córdova, the hero of Ayacucho, and Sucre, who commanded in that battle, successively assassinated in 1829; Venezuela, which he delivered, outlawing Bolívar in 1830—"comme s'il s'agissait d'un bandit"—what a shocking succession of crimes committed in the name of liberty! It is true, however, that in the following half-century New Granada (the present Colombia) had a smaller share of great political crimes and general revolutions—we ignore the State insurrections—than, perhaps, any other republic of Spanish America, excepting Chili; and that the great insurrection of 1876, in which 26,000 revolutionists and 43,000 Government troops faced each other, was an exception in the history of its civil wars. There is also some force in the author's boast that in the long series of presidents who have succeeded one another since 1831—elected for four years before 1861, and for two since then—two only, Obando in 1854, and Mosquera in 1867, have been deposed before the expiration of their terms, both because they aspired to the dictatorship; and that not one of all, whether placed in power by the Conservatives or by the Liberals, who have ruled the country since its transformation in 1861, enriched himself in the presidency.

The Book-Lover's Enchiridion. Thoughts on the Solace and Companionship of Books. Selected and chronologically arranged by Philobiblos. American edition, revised and enlarged. Philadelphia: J. B. Lippincott & Co. 1883.

THIS volume, which was well received on its first publication in England, is now better printed and temptingly bound for American buyers. It consists of quotations in the praise of books. The wisdom of Solomon naturally opens the series; but the ancient writings are soon exhausted, and by far the larger portion of the book is given up to the moderns, there being long extracts from addresses made at the opening of free libraries and on like occasions. What is most noticeable (and it is a comforting reflection) is the completeness with which the thought of these authorities, who are certainly the best, has passed into the region of commonplace—a fact that puts their style to a severe test. There is a characteristic gravity in the earlier extracts, and a practicality in the later ones; but the substantive unanimity of reflection and advice shows how thoroughly the subject has been worked out. Frequently, for example, the authors, both great and small, congratulate themselves on having the society of "the good and great of all ages" without being bored by it; one wonders why some of them did not rather say, "without intruding on it." The book appeals, however, to the specially educated taste of the reader of books; it will delight him with many familiar passages, with many that will pleasantly suggest his own experiences, and with some novelties, for instance in authors' names. The advice how to use books, as of course he has long got beyond tutelage, he will cordially agree with and soon skip, as his habit is—a compliment to which, if he be wise, he will also treat the poetry as a whole.

BOOKS OF THE WEEK.

An Ethical Symposium: Being a Series of Papers concerning Medical Ethics and Etiquette, from the Liberal Standpoint. G. P. Putnam's Sons. $1 25.
Brand, W. F. Life of William Rollinson Whittingham, Fourth Bishop of Maryland. In 2 vols. E. & J. B. Young & Co.
Emerson, R. W. Letters and Social Aims.—Society and Solitude. 2 vols. Boston: Houghton, Mifflin & Co. $1 75 each.
Freligrath-Kroeker, Kate. Alice Through the Looking-Glass, and Other Plays for Children. G. P. Putnam's Sons. $1.
Jones, L. A. A Treatise on the Law of Pledges, including Collateral Securities. Boston: Houghton, Mifflin & Co. $6 50.
May, Sophie. Kittyleen. Lee & Shepard. 75 cents.
Prose Masterpieces from Modern Essayists. 3 vols. G. P. Putnam's Sons. $4 50.

Henry Holt & Co.

HAVE READY IN THE

AMERICAN SCIENCE SERIES

BRIEFER COURSE:

Martin's The Human Body.

By H. Newell Martin, Professor in Johns Hopkins University. 12mo.

Newcomb and Holden's Astronomy.

By Simon Newcomb, Professor in the U. S. Navy, and Edward S. Holden, Director of the Washington Observatory. 12mo, $1 40.

WILL BE READY NOVEMBER 3, IN SAME SERIES:

Packard's Zoology.

By A. S. Packard, Jr., Professor in Brown University.

The above books have been prepared with special reference to use in High Schools and Academies, and for College Classes, which have not time or disposition to go as thoroughly into the details of these sciences as would be necessary in using the well-known larger works in THE AMERICAN SCIENCE SERIES.

☞ *Specimens sent to teachers for examination, post-paid, upon receipt of one-half the advertised prices.*

NEW CATALOGUE OF RARE, STANDARD, SCIENTIFIC, CURIOUS, ETC.,

American and Foreign Books,

Containing Works printed in XVth, XVIth, XVIIth, and XVIIIth centuries, books printed by Benj. Franklin, Old English Dramas, scarce Americana. Fine vellum binding, etc. Sent on application by
LEON & BROTHER, 78 E. Washington Sq., N. Y. City.

FUNK & WAGNALLS'

(10 and 12 Dey St., New York)

NEW PUBLICATIONS.

(READY NOV. 2.)

A POPULAR LIFE OF LUTHER. Based on Köstlin's 'Life of Luther.' Translated and enlarged by G. F. Behringer. The cheapest and best. Very popular in Germany, and will prove most popular in America. Paper, 25 cts.; cloth, $1.

(READY NOV. 10.)

OUR CHRISTMAS IN A PALACE. The latest story by Edward Everett Hale. In artistic holiday binding. Price $1.

STANDARD LIBRARY.

LATE ISSUES.

No. 100. BY-WAYS OF LITERATURE. By David H. Wheeler, LL.D. 25 cents.

No. 98. ILLUSTRATIONS AND MEDITATIONS. A new book by Rev. Charles H. Spurgeon. 25 cents.

No. 94. SCOTTISH CHARACTERISTICS. By Paxton Hood. 25 cents.

HOYT-WARD

CYCLOPEDIA OF QUOTATIONS. Over 17,000 Quotations, besides 50,000 Lines of Concordance. Royal 8vo, cloth, $5. Holiday edition (*very tasty*), $7 50.

"A massive and teeming volume."—*Oliver Wendell Holmes.*

207 WALNUT PLACE, PHILADELPHIA,

DEALERS IN RAILWAY BONDS.

Orders executed at all the exchanges. Correspondence solicited.

J. W. Bouton, 706 Broadway, N. Y.,

PUBLISHES THIS DAY:

Une Journée d'Enfant.

(A Day in the Life of a Child.) Compositions inédites par Adrien Marié. 20 Plates in Heliogravure by Dujardin, with an Introduction by Henry Strahan. Folio, beautiful ornamental French binding, $8.

The bright and charming work of Adrien Marié, 'Une Journée d'Enfant,' having had a magnificent success in France, is now presented, with the gloss of novelty still upon it, to American child-lovers. What parent, what infant, could indeed resist an appeal so delicately true to the life, so adapted to the warmest recognition of everybody? Family joys and cares are alike the world over, and the hundred inimitable touches which reveal the instincts and caprices of childhood will make these pictures as obvious to a transatlantic public as to a French one. There never was a series of child-sketches which went more straight to the heart.

NEARLY READY:

Brillat-Savarin's Physiology du Gout.

A Handbook of Gastronomy. New and complete translation. With 52 original Etchings by Lalauze, printed on China paper. 1 vol. 8vo. *Edition limited to 200 copies.* $15.

Humour, Wit, and Satire of the 17th Century,

Collected and Illustrated by John Ashton, author of 'Social Life in the Reign of Queen Anne.' 12mo, with nearly 100 illustrations. Cloth, uncut, $3.

— THE SAME. Large paper, only 20 copies, 4to, cloth, uncut, $12.

Robinson Crusoe,

Life and Surprising Adventures of. Illustrated with numerous engravings from Drawings by George Cruikshank, expressly designed for this edition. (Reprint of Major's rare edition of 1831.) 4to, large paper, only 100 copies, cloth, uncut, $12.

IN PREPARATION:

SECOND SERIES OF M. RAC[illegible] SPLENDID WORK.

Polychromatic Ornament.

One Hundred and Twenty Plates in Gold, Silver, and Colors, [illegible]rising upward of 2,000 specimens of the various styles of Ancient, Oriental, and Mediæval Art, and including the Renaissance and Seventeenth and Eighteenth Centuries; the subjects selected and arranged by A. Racinet, with Explanatory Description to each plate, and a General History of the Art of Ornamentation. To be completed in ten bi-monthly parts.

The Art of the Old English Potter:

An Account of the Progress of the Craft in England, from the Earliest Period to the Middle of the Eighteenth Century. By L. M. Solon. Forming a handsome volume in imperial quarto, printed on Dutch hand-made paper, and the letterpress accompanied by 50 plates, etched on copper by the author, the printing of which has been done with the greatest care upon superior paper. The book will be issued to subscribers only, and the number of copies will be limited to 250, of which 25 will be offered for sale in America at $50 each. Immediately after the publication the plates will be destroyed.

SPLENDID NEW WORK ON THE ARTS OF JAPAN.

L'Art Japonais.

Par M. Louis Gonse. Illustrated with 64 full-page engravings, 30 of which are to be in colors, executed either by chromolithography or by new processes; 13 etchings, 21 heliogravures by the Dujardin process, and over 700 engravings scattered through the text, exclusive of the facsimiles of seals and autographs of artists. Representing altogether about a thousand articles, paintings, designs, and patterns of Japanese art, forming a complete cyclopædia on the subject. 2 vols. 4to.

Sterne's Sentimental Journey.

A magnificent illustrated edition of Sterne's *chef d'œuvre.* With 12 full-page plates in photogravure, a large number of pen-and-ink sketches in the form of head and tail-pieces, ornamental letters, etc.; together with numerous designs throughout the text, from the original drawings by Louis Leloir. Forming an edition the artistic value of which will be beyond precedent. 1 vol. Columbier 8vo. (A limited issue only.)

An English Version of the Eclogues of Virgil.

By the late Samuel Palmer. With 14 illustrations by the author. Columbier 8vo, and also on large paper, 4to.

Economic and Political Science.

G. P. Putnam's Sons,

NEW YORK AND LONDON.

Publish:

HISTORY OF POLITICAL ECONOMY in Europe. By Jerome Adolph Blanqui, Member of the Institute and Professor of Political Economy. Translated by Emily J. Leonard, with an Introduction by the Hon. David A. Wells. Large 8vo, cloth extra, $3.

This important work, by one of the ablest economists of this century, embraces an account of the economic ideas and systems that have prevailed in Europe from the times of the Greeks and Romans to the present generation, and the causes which have produced the successive modifications in civil, industrial, and commercial ideas, and in government policy.

WORK AND WAGES. By Thos. Brassey. 16mo, cloth, $1.

"The author treats the subject exhaustively, and evinces a thorough knowledge of what he writes about."—*Advance, Chicago.*

ESSAYS ON POLITICAL ECONOMY. By Frederic Bastiat. 12mo, cloth, $1 25.

"The laws of an abstruse science have never been made more clear, or expressed more forcibly."—*Cincinnati Commercial.*

SOPHISMS OF PROTECTION. By Frederic Bastiat. Translated, with Introduction, by Horace White. 12mo, cl., $1.

"We know no work on the subject more readable, incisive, or clearer than this."—*Arcadian.*

"A work full of practical thought, from one of the ablest and clearest of the writers on free trade."—*Hartford Post.*

THE AMERICAN CITIZEN'S Manual. By Worthington C. Ford.

PART I. Governments (National, State, and Local), the Electorate, and the Civil Service. "Questions of the Day." Vol. IV. 8vo, cloth, $1.

PART II. The Functions of Government, considered with special reference to Taxation and Expenditure, the Regulation of Commerce and Industry, Provision for the Poor and Insane, the Management of the Public Lands, etc. "Questions of the Day." Vol. V. 8vo, cl., $1.

"Mr. Ford writes thoughtfully, carefully, impartially, and furnishes one of the best imaginable manuals that could be prepared for circulation on either side of the Atlantic."—*N. Y. World.*

AN ALPHABET IN FINANCE. By Graham McAdam. With Introduction by R. R. Bowker. (In Series of Popular Manuals.) 12mo, cloth, $1 25.

"This volume has been planned to present in clear and readable shape the first principles, or A B C, of financial science."

"It is the kind of book that should be heartily welcomed, as it presents facts and unfailing laws relating to the principles of money, without dictating harsh means to carry out personal views."—*Pittsburgh Commercial.*

SOCIAL ECONOMY. By Jas. E. Thorold Rogers, M.A., Tooke Professor of Economic Science in the University of Oxford. Revised and edited for American Students. 16mo, cloth extra, 75 cents.

"This little volume contains, within a moderate compass, a lucid and forcible explanation of the principles of social economy. We cannot too highly commend this work for teachers, students, and the general public."—*American Athenæum.*

ECONOMICS; or, The Science of Wealth. By J. M. Sturtevant. A Treatise on Political Economy, for the use of High Schools and Colleges, and for the general reader. 8vo, cloth, $1 75.

". . . There is nothing vague or uncertain in his (Mr. Sturtevant's) reasoning. He is comprehensible from beginning to end. As a text book of political economy, we think it will take precedence of all others."—*Troy Whig.*

OUR MERCHANT MARINE: How it Rose, Increased, Became Great, Declined, and Decayed; with an Inquiry into the Conditions Essential to its Resuscitation and Prosperity. By David A. Wells. $1.

"It is full of pregnant suggestions to touch our pride or shame, and prompt a new and vigorous policy for the restoration of our tonnage and flag to the sea."—*Commonwealth.*

THE ECONOMIC MONOGRAPHS. 10 numbers issued, each, 25 cents.

THE ECONOMIC TRACTS. 8 numbers issued, 10 cents and 25 cents.

QUESTIONS OF THE DAY. 8 volumes issued, paper, 40 cents; cloth, $1.

Messrs. PUTNAM are Publishers for

1. THE SOCIETY FOR POLITICAL EDUCATION.
2. THE NEW YORK FREE-TRADE CLUB.
3. THE CIVIL-SERVICE REFORM ASSOCIATION.
4. THE AMERICAN SOCIAL SCIENCE ASSOCIATION.

6. THE FIRST AID TO THE INJURED SOCIETY.
7. THE CHARITY ORGANIZATION SOCIETY.

Full lists sent on application.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 8, 1883.

The Week.

VIEWED from a non-partisan and patriotic point of view, the general results of Tuesday's elections are satisfactory and encouraging. They show on the part of the people no strong drift in favor of either of the great parties, but rather a disposition to vote for the one which is most worthy of support. In this State the verdict is unmistakable. The Democratic majority of 190,000 last year has almost totally disappeared. While the Democrats have been able to save all of their State ticket except its head, they have lost the Legislature and the United States Senator, and have lost all the moral effect of their phenomenal success a year ago. This will be for them as a national party the most serious reverse of the year. It will obliterate completely the effects of the Ohio victory, and deprive them of nearly if not quite all of the advantage over the Republicans with which they expected to enter upon the Presidential campaign. They tried the experiment of carrying the State upon a platform which was silent on the tariff and all national issues, and which was emphatic upon nothing save the necessity of turning the rascals out. They made their campaign mainly upon the issue of putting the Democratic party, including rascals, into office, and they are now able to estimate pretty accurately the value of that issue as a rallying cry for next year. With a Republican ticket against them which excited no popular interest, and in support of which no systematic canvass was made, they have come so near to defeat that they have no better chance of carrying the State in 1884 than the Republicans have.

Outside of New York, Tuesday's results are equally gratifying. In Massachusetts General Butler has been practically driven from political life, and in him the most forbidding personage in American politics disappears. In Pennsylvania it has been shown that the Republican dissensions are sufficiently healed to give the party easy control of the State again. The experiment of reform with a Democratic Governor has not been satisfactory—not so much through lack of disposition on Mr. Pattison's part, as through his inability to resist the desires and tendencies of his own party. The Virginia contest has ended in Mahone's defeat, and he disappears from politics with Butler. His influence in Southern affairs has been almost wholly bad. He, more than any other man, is responsible for the demoralization of Virginia upon questions of financial honor, and although he may have had some influence in securing for the negroes their rights as voters, he has alienated Northern sympathy from all anti Bourbon movements in the South by contaminating them with repudiation principles. His defeat frees the Administration of one of its most unnecessary and damaging alliances.

Little significance attaches to the elections in other States. New Jersey is Democratic by about the usual majority, and so far as Mr. Abbett's success has any meaning it is that the Democrats there have chosen him because he represents what they like best. He was nominated and made his canvass as an open opponent of civil-service reform, and will take office pledged to Mr. Thurman's policy of "taking the boys in out of the cold and warming their toes." In Minnesota the Republicans have elected their candidates by the customary majority, and in the minor elections in other States there are said to be slight Republican gains. Taken together, the elections in October and November cannot be interpreted by either party as a promise of success next year. They do show that the independent vote is held aloof from the Democrats, and that some other issue than "the Republican party must go" will have to be found in order to attract it. Dodging on the tariff, silver coinage, and other important questions has been tried and has been found wanting, as every rational person knew it would be. The temperance issue, which hurt the Republicans so badly in Ohio, was found equally disastrous for the Democrats in New York, and both parties can be depended upon to avoid it as far as possible hereafter. There is no controlling national issue in sight now for next year, but the Democratic Congress may evolve one, and it may possibly be the one which the Democrats have hitherto been trying most carefully to avoid—namely, the tariff.

General Sherman retired on Thursday from active service, after a career which all his brethren in arms may well envy him. He has won a high place among the half-dozen great soldiers of his time. There has been a great deal of depreciatory criticism of the work done by all the other Union generals in the late rebellion, but we believe no critic has ever denied that Sherman was one of the great masters of his art. It is, of course, in Europe that most attention is paid to military topics, because it is there that the largest armies are to be found and most fighting to be done. Nearly all the great military critics, therefore, in our time are European soldiers, and the sympathies of the European military class were almost wholly with the Confederates during the late struggle. Consequently General Lee has, in nearly all the critiques on the operations of the civil war, been put at the head of American generals, by a most laborious and not very ingenuous process, however, in which very little account was made of the defensive facilities afforded him by the nature of the country, which were such as no European soldier had ever seen or dreamed of. To the Union generals, on the other hand, no credit has been given in this quarter which could possibly be withheld. Every presumption has been made to tell against them. General Sherman is the one man among them who has triumphed over this hostility. No critic or commentator has ventured to deny him the marks of genius, or to say that his march through Georgia, and the triumphant sweep Northward afterward, did not put him in the small class of great commanders, and make him one of the historic thunderbolts of war. His military services do not, however, constitute his only claim on the gratitude of his countrymen. They are indebted to him still further for never having allowed his simple and honest soldier's head to be confused by the fumes of flattery or the *ignis fatuus* of politics. He therefore is followed into his retirement by praise and good wishes, in which there is not one particle of alloy.

General Sherman, on retiring, makes some very sensible suggestions about the organization and discipline of the army, of which perhaps the most useful is, that soldiers who are employed in non-military work should be paid the current wages of the particular labor to which they are ordered in the locality in which they perform it. We believe nothing produces more discontent and desertion than the exaction of all sorts of civil labor from men who enlisted without the expectation of anything but soldiering. In fact, it is in order to escape from hard manual labor that a great many young men enlist. They would have no difficulty in getting employment in any kind of work of which they are found capable in the army, without entering the army at all, at the ordinary rate of wages. When, therefore, they find themselves forced into it for a soldier's pay, under the yoke of military discipline, they naturally grumble and run away. Labor of some kind is good for them as for all men. They ought to have it, and be made to do it at every post, but they ought to be paid for it and paid well. If the officers, too, had more to do, there would be fewer military scandals, less drunkenness, gambling, and defalcation.

The Director of the Mint renews his recommendation that the coinage of silver dollars under the two-millions-per-month law be discontinued. He enforces his opinions by the statement that there are now $39,000,000 of these coins in the Treasury over and above the outstanding silver certificates. If we regard the silver reserve in the Treasury as a fund to protect the corresponding paper circulation, nobody can say that it is desirable to keep on hand more metal than the outstanding paper calls for. If, on the other hand, it is the object of the silver coinage to provide all the silver dollars that the people will take and use for any and all purposes, either as coin or paper, then the object has been more than accomplished. The continued operation of the law, as the Director points out, is to take two millions of gold out of the Treasury every month in order to put two millions of silver in its place. The gold so displaced goes to satisfy the greed of the Rothschilds and other pampered aristocrats of the Old World, who will of course do nothing to remonetize silver as long as we are buying

twenty-four millions per annum, and thus sustaining the price of the rupee in the Indian exchanges.

The recommendations of the Chamber of Commerce Stock-Watering Committee are much more moderate than most people probably expected that they would be. The report is satisfactory as showing that we have reached a stage in the discussion of stock-watering at which those who have taken it up are no longer content with vague and empty denunciation of the practice, but feel that this denunciation, of which we have had an abundance, must now be supplemented by practical suggestions as to a remedy. The Committee's first recommendation is that stock-waterings "similar" to the Manhattan Elevated Railway issue of $13,000,000 should be made a penal offence. Everybody would be glad if this could be done, but this is a special case, differing in many respects from the problem presented by ordinary waterings. They also insist that the public welfare calls for some kind of Government supervision and control, and that "ordinary differences" arising between railroads and their customers should be decided summarily by a Government board, so as to avoid the tedious and expensive delays of a lawsuit. There is great force in these recommendations. The most important suggestion made by the Committee, however, is that the capitalization of "surplus" earnings should be prohibited by law, and that all "increase of capital, either by stock or bonded issues, should be defined by strict legal formulas, easily understood and only permitted for good and sufficient public reasons, and not because it can be shown that a corporation can be made to pay a fair dividend on an increased capital," and that the rate of cash dividends should be determined according to the necessarily varying conditions of each particular case, and not by any fixed rule. The chief objection to the latter suggestion is that it would apparently leave the rate to be fixed by a very dangerous sort of special legislation, which would offer from time to time a tempting opportunity for bribery and corruption of all sorts in the Legislature. This objection does not apply to the prohibition of the capitalization of surplus earnings, but here the Committee will find, when they come to put their idea in a legislative form, that they will have to distinguish pretty carefully one kind of capitalization from another. Wicked as it may be to make a high rate of profits look like a low rate by means of "water," the use of profits by a railroad to extend its lines, to buy additional rolling-stock as its business increases, to put up new stations, and so on, is clearly a necessity of the case, and this is capitalization of surplus profits in the true sense of the words. If this can be discriminated successfully by law from the kind of capitalization the Committee evidently have in mind, so much the better; until their scheme of legislation is brought forward, we can hardly say how far it is possible. It must be remembered that the statutes of this State, and probably most others, now positively forbid the issue of stock representing anything but money actually invested or plant; but that the Western Union corporation has successfully triumphed over the obstacles presented by these is pretty generally conceded.

On one point we must emphatically differ from the Committee, and that is as to the cause of the distrust of American securities in foreign markets. They speak of this being attributed to "Yankee tricks" in such a way as to create the impression that it is "water" the foreigners are so afraid of. But it is not. The Yankee tricks of which they complain abroad are the tricks practised by directors in corporate management in their own interest, and at the expense of the stockholders—tricks by which they get possession of roads they are managing as trustees, by which they make contracts with themselves, and "freeze out" the stockholders who, living at a distance, are not in the "ring." The Committee does not produce any evidence to show that it is the dread of "water" which is now keeping the foreign investor out of Wall Street, and we may confidently say that none exists. As a matter of fact, if the practice of stock-watering really enabled directors, as the denouncers of it would sometimes have us believe, to pay two dividends where there was only one before, the demand for American securities abroad would be such as the world has never yet dreamed of.

The testimony collected by the Government for the purpose of bringing civil suits against the Star-route contractors is said to have been placed in the Attorney-General's hands. It is also said that there is very little chance of the Government's getting a verdict, because the suits will have to be brought where the defendants reside, that is, in the Star-route country. In that region, owing to the lavish way in which they have provided the inhabitants with mail "facilities," they have won a firm hold on the affections of the people, much as Tweed in this city endeared himself to a constituency which he was robbing with one hand, by distributing liberal supplies of coal with the other. It is hardly probable that a jury can be found in the Star-route districts which would give the Government a verdict. Under these circumstances, says one correspondent, there are only two reasons for thinking that the Government ought to bring the suits, first, because the statute is "mandatory," and second, because the "moral effect" will be good. What statute it is which compels the Attorney-General to bring suits which there is no chance of his winning, we do not know, any more than we can understand how the cause of morality would be advanced by any more Star-route failures. We very much fear that the only effect would be to confirm a very large number of people in the impression that the chief value of Star-route trials is the comfortable livelihood they afford to "counsel."

There is every day more and more reason to fear that the reduction in the price of the morning papers, unaccompanied by the condensation which has been hitherto the characteristic of the best cheap newspapers, is likely to prove a positive calamity for the community. In other words, the kind of news which some papers evidently suppose to be required by the two-cent public, produced with four-cent prolixity, seems likely to put decent householders who need a cheap daily morning paper, in a position of great perplexity. The old four-cent papers used to be made up on the theory that the four-cent public wished to be spared the nauseous details of crime and vice, but there is a marked tendency, since the two-cent movement began, not to mind what the four-cent people think on these matters, but boldly, for the benefit of the new two-cent public, to make the very most of all the murder, adultery, and lubricity of every description there is going. The murder of an adulterer, for instance, is treated as if it were an inexhaustible topic, for which a column or so a day is not a bit too much, and the case of a woman who disguises herself as a man, and then contracts a fraudulent marriage, becomes a perfect nugget around which a salacious reporter's fancy is allowed to play *ad libitum*. Instructions are said to have been once given by a two-cent editor to his contributors, to write no longer as if they were walking down Fifth Avenue, but as if they were walking down the Bowery; which may be good advice enough, if regarded simply as a direction to be popular and discourse of popular themes, but which in some cases seems to have been taken as a direction to write as if walking down the Bowery on the way to Billy McGlory's dancing saloon.

The Syracuse *Herald* has discovered a novel way of meeting, if not silencing, libellous attacks. It has been very much annoyed by a series of articles with regard to blackmailing, blackmailers, and blackmailing newspaper practices, which have appeared in the Syracuse *Journal*, and which, for some unexplained reason, it takes as reflecting on its own journalistic career. We say unexplained, for the casual reader meeting with such statements as these—a "blackmailing policy soon plays itself out in all cases. The lack of new victims to replenish a low treasury, and the arousal of a public sentiment that reprobates and frowns upon the blackmailer, leads to his sure downfall"—would merely say, "How true that is! How often have I said so myself!" but in Syracuse it appears that when any one comes across such a paragraph he smiles and says: "Aha! That hits the *Herald* pretty hard"—a state of public feeling which, of course, is very injurious to that newspaper. The *Herald* accordingly publishes a long letter addressed to Mr. Carroll E. Smith, whom it holds responsible for these publications. It tells him that he has passed "all the bounds of reputable journalism" (a charge which might or might not wound Mr. Smith), and also that if his blackmail paragraphs are intended to reflect on the *Herald*, he is a liar. It gives him the choice between several distinct varieties of the lie direct, and then tells him that he must now either confess expressly, or by "ignominious silence under the lash," that he is a liar, or else must "proceed against the *Herald* company for defamation of

character." Future proceedings in this case will be watched with interest. The old idea was that it was the libelled person who had to bring an action to clear his character. If he can compel his accuser to bring a suit to show that the libel is not false by simply calling him a liar, the tables are very neatly turned.

The complaint which is heard from all religious quarters now, that people are not going to church so generally as they ought, took a new form at a meeting of Baptist clergymen on Monday. One of them said it was a mistake to set down Brooklyn as a church-going community. He had investigated and had discovered that the proportion of church-goers to the population was not increasing in the same ratio as the growth of the city, and he was convinced that the young men especially were staying away from the churches more generally each year. Various explanations were given for this backsliding on the part of the young men, but the reason which appears to have received the most consideration was that given by Mr. Hutchings, that the "young people were allowed to spend too much time in courting." He had asked a deacon once why his son was not at church, and had been told that he "had gone to see a young lady." He had asked another deacon where his daughter was, and had been told that she was "waiting at home for a young man." No united action was taken to break up this abuse of courting, the reform being looked upon evidently as too serious a one to be undertaken without the fullest deliberation. If it is undertaken, we venture the prediction that the result will be a social convulsion which will shake Brooklyn to its foundations. The young people will not submit without a desperate struggle.

The failure of Ranger, the great Liverpool cotton speculator, whose operations have for three or four years back converted the market in that city into a huge gambling house, will probably produce profound quiet in cotton circles for a year or two to come. He has perhaps reached a higher eminence than any of the produce "Kings" in this country. Even our Lard King never was important enough to have special telegraphic codes concocted for the use of those who were watching his movements. Moreover, Ranger's corner in 1881 is now said to have been such a large and complicated operation as nearly to drive him insane. Corners here sometimes drive people to madness; but it is the people who are cornered. We believe we have never had a corner which was so difficult to "handle" as to overthrow the reason of the cornerer. Ranger has gone the way of all the great gamblers of recent times, except Jay Gould, who is the only one apparently thus far who has known when to stop; but even with regard to him we have to bear in mind Solon's advice, to call no man happy until his death. Ranger's career will furnish the legislative Committee on Corners and Futures with a useful illustration of the folly of trying to stop speculative operations by the law of the land. The laws of human nature are all that such cases call for. They inflict the most tremendous punishment on the great speculators, free of expense to the country, by simply making them too restless to stop, and making their incessant activity ruin their judgment.

We fear it will be impossible for the Irish Nationalists to get the English public to believe that they have had nothing to do with the explosion in the Underground Railroad in London. It will be useless for them to ask people what good it would do them to blow up the innocent passengers in a train. They have been for the last three or four years declaring openly that their great object is to make Englishmen so uncomfortable in the possession of Ireland that they will let her go for the sake of peace and quiet. A good deal of their action in the House of Commons has had this and nothing else in view. The explosion at Whitehall some months ago had this in view. People will conclude that the late explosion had it in view also, if for no other reason than that it has caused the greatest alarm and anxiety, and has helped still further to give a kind of social terror to the Irish question. It is not at all improbable that it is an answer to the very foolish and impolitic talk in which a good many Englishmen, even Liberals who ought to know better, have been indulging during the past year—that the measure of quiet which Ireland now enjoys is due to the Coercion Act. Of course this is exasperating to the Irish, and besides being exasperating it is unnecessary. It illustrates very well that deficiency of "amiability" in Englishmen to which Mr. Matthew Arnold the other night ascribed much of the Irish trouble. Simultaneously with the Coercion Act, two great measures of relief and conciliation were passed. One was the Land Act; the other the Arrears Act. That they have done far more than coercion to produce the comparative tranquillity which reigns in Ireland, no supporter of the policy of the land legislation can question without stultifying himself. With a little more amiability, English Liberal politicians at all events would have taken pains to ascribe the pacification to the healing measures, and, whatever they may have thought, would have kept the coercive agencies in the background. Nothing seems easier and simpler than, in talking about Ireland, to say that the people were more peaceable because they were more secure in their holdings and more certain of the rewards of their own industry. But so ingrained is the English preference for the rule of power to the rule of love, that in nine out of ten public references to the condition of Ireland much is made of the working of the Crimes Act, little or nothing of the working of the Land Act.

If it be true that the Hovas purpose to negotiate with the French, it is a piece of good luck of which the Ferry Ministry are sorely in need. It is not as good news as the news that the Chinese were ready to settle the Tonquin trouble would be, but it makes some improvement in the present situation. The Ministry have openly quarrelled with the Radicals, led by Clémenceau. M. Ferry, in fact, declared war against them in a speech at Havre the other day, and they, on the other hand, are quite ready for the fray. If they should succeed in overthrowing him it is hard to see what could keep them out of power, and their getting into power, it is now generally conceded, would soon lead to the reëstablishment of the monarchy. Things have got so bad under the Republican administration that the property-holders would hardly submit to another step in the same direction. How to get out of the Tonquin trouble without discredit is now the great problem before the Ministry. There would be, of course, no magic in monarchy now any more than thirty years ago, but it would be a change, and a change of any sort always seems desirable to people who are suffering and do not know what is the matter with them. M. Challemel-Lacour has got out of the mess by resigning, on the ground that "a foreign Power" is egging on the Chinese to resist.

A newspaper war has broken out in Paris between *Galignani's Messenger* and the *Morning News*, which bears all the marks of a struggle quite as "internecine" as any that have raged on this side of the Atlantic. The *News* is a cheap paper, lately established as a rival of *Galignani* (which has hitherto enjoyed a monopoly of the Anglo-Saxon circulation of the French capital), and it is pushing itself vigorously. It is what we should call a very "live" newspaper, and has brought on the conflict by attacking *Galignani* in the most vital part — publishing a letter showing the comparative number of copies of each sold at certain stands in Paris, and boldly asserting that "the sale of the *Morning News* is six times larger than that of *Galignani's Messenger*." Instead of replying to this in a business-like way by offering to give $5,000 to some popular charity if the *News* could prove the fact to be so, the managers of *Galignani*, who are hot-headed Europeans, immediately began a suit against the editor of the rival sheet, on the ground that while he had a right to puff his own wares, he could not do so "by using the name of a competitor, without overstepping the rules of permissible competition." Therefore they demand damages to the extent of $4,000, and that the *News* shall be forbidden to use the name of *Galignani's Messenger* under penalty of a heavy fine. The *News* affects to treat this as a capital joke, yet not as good as the attempt to palm off *Galignani* as a "newspaper."

The younger journal is now in trouble again, for in its character of a "bright, newsy little sheet" it sent an interviewer to M. Clémenceau, who, when that gentleman refused to see him, calmly composed a fictitious interview. This M. Clémenceau has resented by asking for the insertion of a letter pronouncing the report fraudulent, to which by the French law he is entitled. His demand has been refused, and the newsy little sheet is again in court for this. In fact, without some important changes in the French law it will not be possible to carry on a really "live newspaper" in Paris. Not only is the law which protects private life from the reporter and interviewer very stringent, but the courts take a very narrow view of the journalist's functions.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, October 31, to TUESDAY, November 6, 1883, inclusive.]

DOMESTIC.

ELECTIONS were held in ten States on Tuesday. Incomplete returns make the following results probable: In New York State, Carr, the Republican candidate for Secretary of State, was elected by about 16,000 majority, over Maynard, the Democratic candidate, who fell many thousand votes behind his ticket on account of his prohibition record. The rest of the Democratic State candidates — Comptroller, State Treasurer, Attorney-General, and Engineer—were elected. It is also probable that the Republicans have carried both branches of the Legislature, the Senate containing 20 Republicans and 12 Democrats, and the House 74 Republicans and 54 Democrats, or a majority of 28 on joint ballot. In New York city the Democratic majority was reduced. On the State ticket, without Maynard, the Democratic majority was 39,000. The next Board of Aldermen will consist of 8 Republicans and 16 Democrats of various shades of opinion. It is probable that John Reilly, the united Democratic candidate for Register, was elected by a plurality over Hess (Rep.) of 15,000. The Democratic judiciary ticket was elected by about 40,000. Nine Republican and fifteen assorted Democratic Assemblymen were elected. The Democrats elect six out of seven State Senators. In Brooklyn, Mayor Low (Ind. and Rep.) is reëlected by 1,840 over Hendrix, Democratic.

In Massachusetts Butler was overwhelmed by Robinson's (Rep.) majority of from 15,000 to 20,000. The entire Republican State ticket receives a similar majority. There are many gains for the same party in the Legislature.

Pennsylvania has fallen back into the Republican ranks with a safe majority of 15,000 for State Treasurer and Auditor-General. The entire Republican city ticket was elected in Philadelphia.

Returns from Virginia are very incomplete, but there are indications of a defeat for Mahone's party on the total vote. His organ gives up the Legislature. His life was endangered during an election row at Fredericksburg.

The result in Connecticut shows large Republican gains in both branches of the Legislature, and the probable election of all the eight Sheriffs voted for. The Democrats were completely routed in their strongholds, Hartford and New Haven.

Mississippi carried both branches of the Legislature for the Democrats. One man was killed in a political quarrel, and the Governor has ordered out the troops to prevent further trouble.

Leon Abbett, Democrat, is elected Governor of New Jersey by about 5,000 majority. The Senate will be Republican and the House Democratic.

Maryland elected Robert M. McLane, a Democrat, Governor, over Hart Benton Holton, the Republican candidate. The Democratic candidates for Comptroller and Attorney-General were also elected.

Nebraska Republicans elected their Justice of the Supreme Court and four Regents of the State University by from 10,000 to 15,000 majority, large Republican gains having been made everywhere.

Minnesota returns show that Governor Hubbard (Rep.) was probably reëlected by a reduced majority. Two years ago his majority was 28,000.

Virginia was excited over a race conflict that took place at Danville on Saturday. Its origin is not perfectly clear, but some alleged insolence on the part of a negro caused a disturbance, and firing at once began on both sides. The firing drew crowds to the scene, and the Mayor at once ordered out the military. The negroes retired to the black quarter of the town before the soldiers arrived. The whole city was roused by the fight. One company of military at once cleared the streets, and something like order was restored. At 11 o'clock P. M. a platoon of soldiers was fired upon by negroes ambuscaded in a house, but without fatal effect. The house was surrounded and one negro was captured. The soldiers were later fired upon by the negroes in different parts of the city. Some six or seven negroes were killed, and two or three white men were wounded. The trouble is charged by the Bourbons indirectly to Mahone's influence.

In a recent political speech in Maryland Fred Douglass said: "The Democratic party has been the life-long, inflexible, persistent enemy of every act of justice proposed for the colored people. The Republicans, on the other hand, have been the active and aggressive advocates of every measure which has thus far contributed to our freedom and progress. We should all vote the Republican ticket till we get something better."

A mass meeting of negroes held at Keokuk, Iowa, on Wednesday night, resolved to ask the next Legislature of Iowa to adopt the section of the Civil-Rights Bill which has been decided to be unconstitutional by the Supreme Court of the United States. A similar meeting was held in Memphis, Tenn., on Friday night.

Governor Cleveland on Friday admitted having written a letter, which had been published, to Mr. John Kelly, expressing a desire that Senator Grady be not renominated, as that gentleman had neglected no opportunity to cripple the Governor's administration.

A large mass meeting of Republicans was held in Cooper Union, in this city, on Saturday evening. Ex-Governor Cornell, William M. Evarts, and Chauncey M. Depew were the speakers.

A number of influential Germans, including representatives of the brewing interest, met in Rochester last week and passed resolutions to support the Democratic State ticket with the exception of Isaac H. Maynard, the candidate for Secretary of State, who was accused of being a Prohibitionist.

The contest for the minor offices in the House of Representatives has already begun in Washington. The candidates for Sergeant-at-Arms and Doorkeeper spend much time there.

The transfer of the command of the armies of the United States from General Sherman to Lieutenant General Sheridan was made on Thursday, at noon, in Washington, without ceremony, except that the staff officers were present in full dress uniform. General orders were issued to the army announcing the change.

The last annual report of General Sherman has been submitted to the Secretary of War. In it he asserts that the Indian problem has been substantially eliminated from the problem of the army. This result has been brought about by immigration, railway construction, and the army. General Sherman also submits a plan for reorganizing the army, which would admit of its increase without disorder or confusion to 40,000 men, and afterward the force could be doubled without the addition of a single officer.

Secretary Lincoln is not satisfied with Lieutenant Garlington's explanation of his conduct of the Greely relief expedition, and has asked for further information. The Secretary says, in a letter to Chief Signal Officer Hazen on the subject: "It appears to me that Lieutenant Garlington's supplementary reports only make an understanding of his failure to remain at or near Littleton Island after the loss of the *Proteus* more difficult than before." The Secretary has recommended to the President that a Court of Inquiry be appointed.

The annual report of the Paymaster-General to the Secretary of War shows that the receipts for the last fiscal year amounted to $15,490,310, and the disbursements to $13,382,164.

The annual report of W. W. Upton, Second Comptroller of the Treasury, has been submitted to Secretary Folger. It shows that during the last fiscal year 28,516 accounts and claims were settled, involving an expenditure of $99,462,600. Judge Upton devotes considerable space to the inadequate clerical force now allowed his office, and gives figures to show that work is fast accumulating, with no prospect of speedy adjustment.

The public debt of the United States was reduced during the month of October, $10,304,798 83.

Hereafter pension agents will not be suspended from practice before the Interior Department when prima-facie cases of irregularity have been submitted to the Commissioner of Pensions, except for special reasons communicated to the Secretary of the Interior.

The Secretary of State, Mr. Frelinghuysen, has written a letter to a number of Irish citizens of Chicago, in regard to Peter Carey's assassin, in which he says: "In the event of its being ascertained that Patrick O'Donnell is an American citizen, he will receive from the Executive Department of this Government all the protection to which he is entitled. It is not within the province of this Department to ask a modification of the ruling of the court in a particular pending case." He adds that if the English court should need an assurance of the high standing of the counsel from this country, the American Minister will be instructed to give an assurance of their standing.

The Board of Directors of the Pennsylvania Railroad Company held a meeting on Thursday afternoon in Philadelphia, and agreed upon a semi-annual dividend of 4½ per cent. cash, of which stockholders have the privilege of taking 2 per cent. in stock at par.

A Commission in favor of the Hennepin Canal scheme met in Chicago on Thursday.

Heavy gales along the coast and on the Lakes during the week have done much damage to shipping.

About 2 o'clock on Monday afternoon Springfield, Mo., was visited by a tornado. The path of the storm was only a few yards wide, but it destroyed everything that it passed over. Thirty buildings were destroyed and about 200 others damaged. It is believed that seven persons were killed and many were injured. The loss of property is about $250,000. The neighboring town of Brookline was also visited. The path of the tornado there was about 300 yards wide. Thirty small houses were blown down and a number of people injured. Farm-houses in the neighborhood of Republic were also destroyed.

A fire which had its origin on Wednesday noon in the large cotton warehouse of Garnett, Stubbs & Co., in Savannah, Ga., destroyed the warehouse, containing 3,000 bales of cotton, 300 houses, covering an area half a mile square, and caused a loss of nine lives. Careful estimate fixes the losses at nearly $1,000,000 and the insurance at not half that amount.

The bi-centennial of the formation of Staten Island into Richmond County was celebrated on Thursday amid great enthusiasm.

The Sophomore and the greater part of the Freshman Class at the Troy (N. Y.) Polytechnic Institute were suspended on Friday for engaging in a fight over a class flag on the top of the college building, and destroying about $300 worth of property.

After many delays the action for libel by Gaston L. Feuardent against Louis P. Di Cesnola was called up for trial on Wednesday before Judge Shipman and a jury, in the United States Circuit Court in this city. The plaintiff in 1879 asserted that certain objects in the Metropolitan Museum of Art in this city had been tampered with, the design being to

deceive the public as to their genuineness and value. These charges the defendant declared through the press to be malicious and absolutely false. This statement the plaintiff claims is grossly libellous. Testimony in the case has been offered during the week.

Arthur B. Johnson, a well-known Stalwart politician and friend of ex-Senator Conkling, committed suicide in his office at Utica during the early hours of Saturday morning. He was an uncle of J. L. Lynch, who was killed at Batavia, N. Y., on Wednesday night by a husband he had wronged. This event, together with a social scandal connected with his own name, wrought upon his mind, which has been unsettled of late, and led to the deed. He was fifty-five years of age. He was a member of a prominent and influential family.

FOREIGN.

The explosions in the underground railways in London caused great excitement, and led to a careful investigation. It is said that the London police warned the railway officials three months ago that they had received advices from America threatening such explosions. The Irish in London think that the outrages were planned by enemies of the National party of Ireland, who intend to create an anti-Irish feeling in England. It is believed that nitro-glycerine was the explosive used. The British Government has offered $2,500 reward for information leading to the conviction of the criminals. The railway companies have offered an equal amount.

Considerable excitement was caused in London on Friday evening by the announcement in a newspaper extra that the authorities had been anonymously informed that an attempt would be made to destroy the train on which the Duke and Duchess of Connaught were to travel from London to Dover on their way to India. Elaborate precautions were taken by the railway authorities and police. The journey was accomplished by the royal party without incident.

A procession of Irish Nationalists was fired upon by Orangemen in Londonderry on Thursday. A man and a boy were wounded. The police and soldiers cleared the streets of the mob. On Saturday a parade of Irish women was stoned in the streets of the same city. They fought the mob desperately.

Michael Davitt, in a lecture recently delivered in London, advocated the nationalization of land, and denounced the course of Lord Salisbury and Sir Stafford Northcote in stirring up discord in Ireland.

In a recent address Lord Hartington, British Secretary of War, said that he thought that Mr. Gladstone, in his coming speech at the installation of the Lord Mayor of London, would be able to say that the peace of Europe was assured, and that the difficulties of England with France were settled, although a state of things might arise with China which would require all of England's friendship and forbearance to prevent serious complications resulting therefrom.

The London *Pall Mall Gazette*, on Tuesday, said it was probable that the British Government would introduce at the next session of Parliament a Household Suffrage bill, which should apply to both town and country in all parts of Great Britain and Ireland alike. A bill for the redistribution of seats in the House of Commons will probably follow the above measure.

Lord Lorne and the Princess Louise arrived in Liverpool on Monday, and were received with enthusiasm.

Lord Coleridge arrived at Liverpool from New York on Monday after a pleasant voyage.

Two more firms of cotton brokers suspended in Liverpool on Wednesday, and the excitement in the cotton trade continued to be great. It was reported that the liabilities of Morris Ranger were £750,000. His failure is attributed to reckless speculation. There was an easier feeling in the Liverpool market on Thursday afternoon. Another failure was announced on Friday.

The International Fisheries Exhibition was brought to a close in London on Wednesday. The Chairman of the Executive Committee read a report showing the complete success of the Exhibition. The Prince of Wales made a very complimentary reply.

Mr. Moody successfully opened his great mission at Islington, London, on Sunday. More than 4,000 persons were present at each of the four services.

The steamer *Holyhead*, from Dublin, came in collision with the German ship *Alhambra* when twenty-five miles off Holyhead on the night of October 30. Both vessels soon after went down. The boats of the *Holyhead* saved all on board but two of the crew. There were sixty passengers on board. Fifteen of the crew of the *Alhambra* were drowned; twelve were saved.

M. Challemel-Lacour, French Minister of Foreign Affairs, will, it was reported on Friday, soon resign his portfolio, because, it is alleged, he has publicly intimated that England has been urging China to resist France. Prime Minister Ferry will take charge of his portfolio, and M. Paul Bert will take the Ministry of Public Instruction, in place of M. Ferry. Another report is that M. Challemel-Lacour only goes to Cannes for the benefit of his health, and will resume his portfolio on his return.

An order of the day expressing confidence in the firmness and prudence of the Government was adopted by a vote of 339 to 160 in the French Chamber of Deputies on Wednesday, after a long debate, in which Prime Minister Ferry and M. Clémenceau took part.

A Paris rumor is that Great Britain has sounded the Brazilian and United States Governments to ascertain whether they would mediate between France and China. It is also asserted in Paris that, on the day after the meeting of the Chamber of Deputies, orders were sent to Admiral Courbet to push operations in Tonquin, in order to make the Chinese Government show what course it intends to pursue, so that France can take definite action.

It is reported in Paris that the First Secretary of the Chinese Legation there has stated that war between China and France is now certain. The French Cabinet Council on Friday discussed General Bouet's account of the French position on the Red River, but nothing was decided. The Chamber of Deputies will probably be asked to vote a new credit. In his account General Bouet states that at least 10,000 men of all arms—infantry, cavalry, and artillery—will be required. It is asserted that General Campenon, Minister of War, is preparing a reserve corps of 10,000 troops for service in Tonquin.

The Marquis Tseng, the Chinese Ambassador to France, had his attention called to the assertion made by M. Tricou, the French Agent to China, that Li Hung Chang had disavowed the policy pursued by the Marquis Tseng upon the Tonquin question. In reply to the assertion, the Marquis repelled the intimation conveyed that there are differences between Li Hung Chang and himself by saying, "I have the same opinions as Li Hung Chang." A despatch from the Chinese Government confirms the statement of Marquis Tseng and approves of his course.

In an interview published on Tuesday the Marquis Tseng is reported as saying that if war occurred between France and China, which he believed to be probable, the kingdom of Anam would become the ally of China. The French, he said, would require 40,000 troops to overcome their united forces. Meantime England's commercial interests would compel her to intervene.

The French forces have occupied Kuangyen, some forty miles northeast of Haiphong, and Ninhbinh, which is some seventy miles southwest of Haiphong.

Admiral Galiber, commander of the French forces in Madagascar, telegraphs that the Hovas have asked to come to terms with the French authorities, and that negotiations have been opened. An early settlement of the difficulties may be expected. France has moderated her claims for indemnity.

A letter from Tamatave, Madagascar, dated October 4, asserts that the Malagassy Envoys who recently visited Europe and the United States, and the Prime Minister of Madagascar, have been strangled in their native land. This report has not been confirmed.

It was reported in Paris on Wednesday that M. de Brazza, the French African explorer, had been killed in a fight in the Congo country. The report has not been confirmed.

A party of French Anarchists on Monday exploded an infernal machine in front of the mansion of a wealthy merchant of Lyons. Great damage was done to the building, but no one was hurt.

The International Labor Congress closed its session in Paris on Thursday.

Señor Moret, Spanish Minister of the Interior, and Gen. Lopez Dominguez, Minister of War, have acquired proof of fresh intrigues between political exiles and their friends in Spain with a view to preparing for another military disturbance. The Government has discovered that these intriguers are connected with a ring of speculators at home and abroad.

The Spanish Cabinet has resolved to summon the Cortes to assemble on December 15.

Festivities were held at Worms and Wittenberg on Wednesday to commemorate Luther's nailing the theses to the church door, thereby inaugurating the Reformation.

Serious encounters have taken place between the troops and the rebels in the Crna Reka district of Servia.

The Egyptian Government was informed on Wednesday that Hicks Pasha, after two battles, entered El Obeid, which place he found had been abandoned by the forces of El Mahdi, the False Prophet. Many of El Mahdi's men, it was reported, were killed in the two battles, and his forces were broken up. There has been no official confirmation of the report, and military authorities in Cairo doubt it. It is regarded as mere bazaar gossip.

There was but one death from cholera in Alexandria, Egypt, on Monday.

Jeremiah Daignault & Co., of Montreal, the largest buyers and shippers of bark in Canada, have failed, with liabilities amounting to $400,000. The failure is the outcome of an attempt, conjointly with the Shaw Brothers, of Boston, to corner the market.

It is reported in Montreal that the Canadian High Commissioner has nearly completed arrangements in Paris for the sale of the island of Anticosti to the French Government, the object being to bring to an amicable termination the difficulties existing between the English and French fishermen in Newfoundland. The latter would be invited to establish themselves on that island.

The Iglesias Government in Peru has resolved not to recognize Montero's acts. Montero has resigned command of the defending force in Arequipa. The troops are greatly exasperated, and have killed two of his aides-de-camp.

The latest accounts from Afghanistan show that the country is in a state of complete anarchy. The exchequer is without funds and the troops are demoralized. The Amir is a mere plaything in the hands of the Ghilzais.

THE SUEZ CANAL QUESTION.

The British Shipmasters' Association have again asked Mr. Gladstone's Government to take some decided steps in the matter of a new Suez Canal. Obviously the question is one which will not sleep. The demands of commerce have outrun the capacity of the existing canal, and whatever may be the political or other impediments which stand in the way of a new canal to be constructed under British auspices, the pressure for more passageway of some sort is imperative and growing.

The outburst of opposition with which Mr. Gladstone's arrangement with M. de Lesseps was received last summer, and by which it was borne down, has been productive of nothing but delay. When the joint project was abandoned, Lesseps announced that he would go on and dig a new canal within the boundaries conceded to him in his original grant, if a new grant could not be obtained from the Egyptian Government. When this announcement was made, Lord Salisbury moved a petition to the Queen that she should use her influence to prevent the granting of any further concessions to Lesseps and his company. No vote was taken upon this motion, the effect of which, if agreed to by Parliament, would be to put a block upon any movement by the existing canal company, unless it should be found practicable to do all the work within their own territory. British interests would evidently be the principal sufferers from such a block, since they furnish three-fourths of the traffic. Moreover, the canal being under French control, it would be easy to discriminate against British ships in a crowded waterway, and this, the British ship-owners say, has been done to an aggravating extent.

Looking back to the time when Mr. Gladstone was forced to recede from his provisional agreement with Lesseps, it is quite plain that the agreement was an advantageous one for British interests, and that the explosion of wrath which assailed it was exceedingly ill-timed and unfounded, not to say immoral. It sprang from the fact that England had got temporary possession of Egypt by force of arms. But the occupation of the country under the circumstances and the declarations which preceded it, gave England no rights which she did not possess before. She went there to establish order. To wrest from the Khedive a concession for a new canal, in violation of the existing contract with Lesseps, or regardless of it, would have been a flagrant departure from the declared purposes of the war, and an affront to France the consequences of which could not have been foreseen. The British ship-owners and commercial classes would never have thought of pushing the new canal project without the co-operation of the old company, before the bombardment of Alexandria. Yet no lawyer in Christendom would have said that the bombardment of Alexandria gave them a better title to sit in judgment on the Lesseps contract than they had before. The enlargement of their power did not enlarge their rights. This was conceded by Lord Granville throughout the negotiations, and it was upon this idea that Mr. Gladstone took his stand. Although forced by the opposition of the commercial bodies to abandon the agreement, he never receded from the position that the Lesseps contract was to be construed by law and not by force.

This contract, entered into between the Suez Canal Company and the Egyptian Government twenty years ago, provided that the company should have the exclusive right to build and operate a canal or canals between the Red Sea and the Mediterranean through Egyptian territory. It was confirmed by the Sultan of Turkey. It had every feature which could give sanctity and authority to a written agreement. The British crown lawyers so declared. A few casuists who sought to find flaws in it were easily routed in the debate, and Lord Salisbury was driven to say that the Suez Canal should be treated and dealt with in the same way as the Cattegat—in other words, that an artificial waterway should be held subject to the same principles as a natural one. This novel doctrine was pulled in pieces by the Lord Chancellor to such purpose that it has never been heard of since.

If the British ship-owners were not justified upon moral grounds in their angry opposition to Mr. Gladstone's agreement, they were still less so on other grounds. The British Government owned nearly one-half of the shares of the Suez Canal Company, and could easily have acquired the small amount needed to gain a majority. The voting power did not attach to these shares immediately, but it was only deferred for a short time, and in the interim it was quite certain that no advantage would be taken by Lesseps as against the largest shareholder, who happened to be also the first commercial and naval Power in the world. This fact was ignored by the impatient ship-owners and the doctrinaires who sided with them. Yet no fact had a more practical or potent bearing on the case. The sole object and purpose of the agitation being to get a new canal under British control, the shortest way would have been to make use of the vantage ground already gained in the ownership of 170,000 shares of the old company. From this standpoint absolute and peaceful control within a reasonable time was possible, if absolute control were needed. By the methods urged by the ship-owners, backed by the conservative party in Parliament, no control or approach to it was possible, except at the price of very strained relations with France, coupled with the risk of establishing an ugly precedent and the certainty of tarnishing the fame of Great Britain in the eyes of mankind.

Four months have passed away, and the ship-owners find themselves exactly where they were in the beginning. The same difficulties beset them now. They have alienated the good will of the canal company and gained nothing. The Government has not changed its views. The grounds of its refusal to take advantage of its military occupation of Egypt to force the hand of Lesseps being moral grounds, it could not change. The excitement having subsided, the opportunity is now afforded to anybody to show a better plan than Mr. Gladstone's for securing a new canal. None has been suggested that does not look to violent measures and a rupture with France. In short, the ship-owners and commercial bodies have thrown away in a fit of anger a very advantageous arrangement, without substituting anything in its place, and they ought, if Lesseps and his company are willing to resume the negotiation where it was broken off, to embrace the opportunity at once.

GOODNESS AND THEATRE-GOING.

The Rev. Dr. Cuyler's announcement that "no good woman wants her sons and daughters" at the theatre, perhaps excited more indignation than it calls for. In order to criticise him intelligently, one would have to find out what he meant by "good," and it would probably appear that he did not use the word in the ordinary sense, but, in fact, restricted the term "good women" to female members of his own church or denomination, or of one or two other denominations holding the old view touching the separation of "the church" and "the world," and touching what are called "worldly amusements." As a matter of fact, we believe, it is only the sects known in England as Dissenters (that is, the Congregationalists, Presbyterians, and Methodists), the French Calvinists, and that portion of the Anglican Church which used to be called "Low," or "Evangelical," in the whole Christian world that have ever offered decided opposition to theatre-going. The Catholic Church has confined itself in the main to denouncing the actors and actresses, which is not only more economical, but a much more sensible proceeding.

The objections of evangelical people to the theatre are well known. The principal one, the introduction of immoral motives or situations into the plot, is really almost as applicable to novels as to plays, and at one time sufficed to exclude novels from the reading of religious people, and to have them kept as far as possible out of the hands of young people of both sexes. That this prejudice has been greatly abated, if it has not been destroyed, within the last fifty years, is largely due to the modern school of English novelists, such as Dickens, Thackeray, George Eliot, Trollope, and others, who made the novel good family reading. In fact, they introduced the novel into religious society, and made it possible for the boys and girls to be caught reading it without shame or fear. Since then there has been a distinction between good and bad novels in the Anglo-Saxon world, but it can hardly be said to have found its way to France, probably because of the power of what Mr. Arnold calls "lubricity" over the French imagination. It is, indeed, to French light literature, and to the French drama, very much what yeast is to bread. It gives flavor and lightness and digestibility, and is so generally used in the French literary bakeries that the mere epithet "French" attached to a novel or play connotes a touch of indecency or immorality.

No attempts to purify the drama, as the novel has been purified, have as yet been successful, probably because the playwright has not room enough to make purity exciting or interesting. The novelist is able to carry

his heroes and heroines through a long series of events, on which he can lavish all his art in the way of decoration and complication, and can keep the reader's curiosity rising all through the approach to a very distant dénouement. The dramatist has to crowd everything into two hours, and must make his impression with a few strokes, which need to be very vivid and stimulating to accomplish their object within the time. The temptation to be audacious, both in the dialogue and the situations, is thus very strong, and, this considered, it must be admitted that the Anglo-American stage is remarkably pure and decent both in speech and behavior. But it will probably never be possible to make the theatre a fit place for Doctor Cuyler's "good women"—that is to say, a place in which they will see and hear nothing that would be considered out of place in a church sewing circle, or in the parlor of a religious family. An attempt in this direction has been made in this city at one theatre, by the production of plays which might, as far as plot and dialogue are concerned, be acted by a Sunday school. They have all the outward appearance of great success, for they have drawn crowded houses during very long runs, and are now meeting with a similar reception in England. But that they owe this success to the fact that only one theatre produces them, there is little doubt. They reach a public which usually does not go to the theatre, and is delighted to be able to see an improving play, in which even the villains are only giddy or thoughtless. But this public is, after all, very small, and probably could not support more than one little theatre, even in a large city. Theatres not purely comic cannot live in our time on a limited selection from the passions by which the world is moved. They must, in order to draw the needed support, furnish something like a picture of human life, and no picture of human life is complete or can interest the mass of mankind from which the really tragic side is excluded. But the tragic side is filled with the play of all the great passions—those which raise to heaven, as well as those which sink to hell. It is not a world in which the worst that happens are broken engagements among young people, and temporary coolnesses between husbands and wives, but a world of

> "Blight and famine, plague and earthquake, roaring deeps and fiery sands,
> Clanging fights and flaming towns, sinking ships and praying hands."

There are, of course, two ways of producing on the stage the play of the passions—a corrupting way, full of evil suggestion, and a simply illustrative way, which fortifies the moral judgment. But in neither way can the stage probably ever be made attractive to people of Doctor Cuyler's way of thinking, for to him, as to all the older school of moralists, ignorance of vice is the great, if not the greatest, purely mundane support of virtue. From the earliest days of Christianity the good man, and still more the good woman, have been encouraged to find safety in flight—to make their virtue, in fact, as far as possible, a cloistered virtue. The Roman Church ended by literally shutting up all the very pious people, and treating stone walls as the only sure defence against Satan. The tradition lingers in the evangelical theory of the necessity of absolute separation between the Christian man and "the world"—a term which really means in ecclesiastical nomenclature that portion of mankind which amuses itself for amusement's sake, and without any view to moral culture. It is not likely that the latter will ever be able to get up a theatre which the former will find an edifying place of resort. Moreover, all the tendencies of our time, outside the evangelical denominations, are toward the repudiation of seclusion as a sanction of morality, and towards treating all goodness which rests on it as conventional goodness simply—that is, as something too vapory and unsubstantial to be worth cultivation. The good man or woman of the next century will probably be the man or woman who, knowing evil well, chooses and pursues the right.

LUTHER AND THE CLASSICS.

The fourth centenary of Luther's birth has called forth all manner of Lutheran demonstration and Lutheran literature in Germany, to which there has been a modest echo in the United States, the home of so many of Luther's countrymen. One of the last contributions to the study of Luther's works is a posthumous pamphlet by Dr. O. G. Schmidt, an enthusiastic student of Luther's writings, and an ardent lover of the ancient classics. In this tract Doctor Schmidt, alarmed by the assaults that are made on classical studies in Germany, has bequeathed to us the results of his researches as to Luther's acquaintance with the Greek and Roman classics, in the hope that the mad materialists will pause and reflect that "Germany's greatest son was no stranger in that field of knowledge." It is very much to be feared that neither the materialists nor the "modernists" of America will care much for such an argument. Muscle is muscle, and bone is bone, and it will be contended that modern muscle and modern bone can be made out of modern fare as well as out of ancient. Nectar and ambrosia, if they sustain intellectual life at all, which seems to be doubted, can contain nothing more essential to life than baked beans and Boston brown bread. As to Luther himself, it may fairly be said that the classics were in his time the best reading to be had; that Latin was the common medium of all education worthy of the name; and that, if Luther were living now, he would not care any more for the classics than he cared then for what he considered mediæval rubbish. Evidently, what Luther read, and liked to read, in the beginning of the sixteenth century cannot be of any vital importance to us as students of educational methods, although it has a certain interest for those who study the equipment of one of the greatest figures in modern history. The defence of the study of the ancient classics, if defence is really needed, must be put on other ground than the example of a man who lived in the light of the Renaissance. And so the classical scholar will look rather coldly on the trite quotations, from the usual school-books, that Doctor Martinus Lutherus has dropped here and there in his voluminous writings.

What is of real interest is the manly way in which he treats the classic authors. The man who called the Epistle of James a *straminea epistola* was not likely to unbonnet before a heathen, ancient or modern, Horace or Erasmus, simply because that heathen had a better command of the Latin language than he had. To Luther, with all his admiration for Cicero, *Sancte Cicero, ora pro nobis*, was as silly as it was blasphemous. Those whose business it is to teach Latin and Greek often get up a spurious enthusiasm for everything Latin and Greek. Now and then, in a paroxysm of rebellion, a certain author is devoted to the infernal gods. A great scholar arises who irreverently speaks of Cicero's writings as a Sahara. Ovid, by reason of his restless talent, is and has been fair game for fault-finders. But the general tone is that of rapt admiration. A few years ago it was hinted that Thucydides was human; that as a politician he had not been altogether unacquainted with the Machine; that at a certain time he had found it expedient to vote the Cleon ticket, with the reserved right of turning against Cleon when it suited him. The points may not have been well taken—they may have been rashly and rudely advanced; but there was no call for the hubbub raised in the scholarly world about the audacities of Müller-Strübing. Luther's attitude is, humanly speaking, much more respectable.

Doctor Schmidt treats of Luther's training in the humanities; his acquaintance with the Roman prose-writers, the Roman poets; his own Latin poetry; his relations to Hellenic literature; and the influence of classical studies on Luther's intellectual life. A few points must suffice. So far from being surprised at the extent of Luther's reading in the ancient classics, one is surprised rather that he did not make more use of these revered authorities in an age so much under the domination of their charm. Of the Latin prose-writers, Cicero of course leads the van. Everybody was brought up on Cicero at that time, and Luther gives him all the credit for the Greek wisdom that Cicero conveyed with cynical coolness. Luther is astonished that a man so deep in great affairs could have read and written so much, and contrasts him with Aristotle, very much to the disadvantage of the great sage, whom he calls "an unemployed ass, who had gold and goods and jolly, idle days enough," whereas Cicero was up to his eyes in work and bearing vast burdens of state. There are but few indications of an intimate acquaintance on Luther's part with Livy or Sallust or Tacitus. Pliny the elder was the great storehouse of knowledge in those days—the 'Conversations-Lexikon,' the 'Encyclopædia Britannica' of the time. But Luther does not like Pliny, for all that: Pliny is a materialist and an epicurean, and he dismisses him with the contemptuous epithet of "a clever fool." Melanchthon was wasting time on Pliny that he might better have spent on the Epistle to the Romans.

Of Roman comedy Luther was a great admirer, and favored the acting of the plays of Terence. He thought the moral tendency admirable, encouraged the boys in the school at Wittenberg in their dramatical performances, and tried to get up a game supper after the play. Westminster and Wittenberg are thus bound together by an old tradition. Virgil was his delight. On a scrap of paper written two days before his death, he made the note that no one could understand the Bucolics unless he had been a shepherd for five years, nor the Georgics unless he had been a farmer for the same length of time. One who is neither might be permitted to suggest that even Luther was too much under the traditional spell to be a good judge—peasant as he had been himself. At any rate, it is rather strange that he should have put the Bucolics on the same line with the Georgics. Horace was too much of an epicurean for Luther's taste, and he depresses him below—Prudentius, Catullus, Juvenal, and Martial he would not suffer in the school-room, though he could not resist the temptation to quote Juvenal on occasion. With correct instinct, he questioned

whether Lucan could be called a poet, and wisely postponed buying a copy of the 'Pharsalia' to the closing years of his life.

Luther's own Latin poetry is meagre in quantity, and not remarkable for quality, in an age of trained parrots. Of Greek, not "a College Fetish" yet, he evidently knew very little. Much that he refers to comes to him at second hand. To Aristotle he was a sworn foe. Plato, he thought, was often in fun, and amused himself at the expense of other philosophers—a frivolous view of Plato, with which the solemn commentators among Luther's countrymen will have little sympathy. So, throughout, Luther says what he thinks with refreshing directness, and in this way, at least, sets modern scholars a good example.

GERMAN AFFAIRS.

BERLIN, October 29.

SINCE the close of the extraordinary session of the Reichstag our political life has been rather dull, the whole Government machine working at half speed, while our public men sought recreation in the mountains and watering places, and the high official, military, and royal world went to manœuvres and parades, or exchanged visits. The newspapers, nevertheless, have been filled with all sorts of rumors, and for the sake of sensational news raised the war cry, now for the East, now for the West. There is, however, no impending danger. Russia is the only Power which, in consequence of her domestic difficulties, may be driven into a war (and she can find a tolerably good pretext in the present Bulgarian imbroglio). If the Czar can subdue the discontented parties, Russia will remain quiet; but if the Opposition prevails, we may witness a second and enlarged edition of the last Russo-Turkish war, if not a general European conflagration. So much, however, is certain, and I can positively assert, that Germany detests a war, that she will do everything in her power to avoid it, and that in this respect she is just the reverse of what Louis Napoleon was in the days of his glory. On this point there is no difference of opinion all over our country; the Government's policy is endorsed almost unanimously by the people.

Last week, viz., October 18 to 20, the elections for the Common Council of this city took place. For weeks they had occupied the foreground of public interest, inasmuch as for the first time since its existence (1808) an entirely new election of all its 126 members was made necessary. Politics, of course, in a well-regulated community, never ought to interfere with the election of an administrative corporation: but, in the present case, the Government itself had introduced politics for the purpose of breaking up the "Progressive ring" (an expression which Prince Bismarck had borrowed from American political slang, and which was hastily taken up by his Secretary of the Interior, Herr von Puttkamer, his most unscrupulous supporter). Both gentlemen, principal and clerk, about two years ago commenced the battle for the Redhouse (City Hall) by throwing out the threat of dissolving the present Common Council, for the reason that it was a corrupt and inefficient body, which sacrificed the general interest to party strife and quarrels. Now the fact is that the popular representation of the city did not prove a pliant and subservient tool which Bismarck could handle as he pleased, and that its members in their great majority were men of ability, experience, and backbone, who knew how to carry out their measures. There is and has been no large capital the affairs of which have been and are managed in so practical, business-like, and economical style as in Berlin. This city is now in the process of transition from a large Government town and royal residence into a really great imperial city, and has about the same number of inhabitants as New York. Its growth, too, is of quite American character. In 1648 Berlin had only 6,000 inhabitants; in 1709, 55,000; in 1755, 136,664; in 1790, 150,803; in 1816, 195,200; in 1840, 322,640; in 1861, 547,571; in 1875, 964,240; and in 1880, 1,122,504. In consequence of this rapid increase of population the city has to attend to all sorts of modern improvements, such as sewerage, extensive waterworks, electric lighting of the principal streets, new pavement, erection of expensive bridges, and enormous costs for educational purposes. Of the budget of about 23,000,000 marks (nearly $6,000,000) every penny has been and is well spent and accounted for. In short, a more honest and efficient administration has seldom existed. It is composed of men of all parties, who, free from any political bias, are animated by a common desire for the promotion of the city's welfare.

Our Conservatives, however, hate an efficient self-government which makes patriarchal rule and the interference of red tape superfluous. Knowing that they served Bismarck's ultimate ends, they therefore denounced the City Council as an anti-monarchical ring, without a vein of patriotic feeling, that ought to be put out of the way. The anti-Semitic clique took hold of the agitation and raised the wildest passions. Government clerks, and even civil officers, coöperated with the street demagogues, with Court Preacher Stoecker and men of that ilk; but, nevertheless, Mr. von Puttkamer did not dare to dissolve the Common Council. Finally, another stratagem was resorted to. The Minister suddenly discovered that the several districts were too unequal in extent and population, and that, in accordance with the present distribution of the inhabitants of the city, new districts ought to be laid out. On this plan last week the new election of the 126 Councilmen took place. For this purpose the taxpayers, according to their income, are divided into three classes, each of which elects 42 candidates. Thus the first class, even if it comprises only 10 per cent. of the number of the third class, votes for as many Councilmen as the latter. The result was that the first and second classes polled their votes for the so-called Liberal ticket (the present incumbents), while the third elected 22 Liberals, 5 members of the so-called Citizens' Party (anti-Semites), and 2 Social Democrats. In 13 cases an absolute majority was not reached. In such an emergency the two candidates having the largest number of votes must submit to a second election. The result stands at present 106 Liberals, 5 Citizens' Party and 2 Social Democrats. As the impending 13 new elections will give the Liberals at least 6 seats more, there will finally be a Liberal majority of 112 against a minority of 14.

Satisfactory as this result may be, and conclusively as it has shown the utter barrenness of a party without positive ideas, it creates on the other hand a very uneasy feeling. For the first time the doors of the City Hall have been opened to the Social Democrats, and this has been done by the Secretary of the Interior himself, who, it seems, does not understand that he is playing with fire. After this defeat, the ministerial organs suddenly found out that the victory of the independent people involved no principle at all, and that the object of the contest had only been an administrative measure. "The bourgeois," says the *Kreuz-Zeitung*, a reactionary paper, "have triumphed over the citizens," thus throwing the odium of the former term on the men who wanted to maintain their time-honored and sterling institutions. "Woe to our city," said Councilman Virchow, the celebrated professor of physiology, a few days ago, at a public meeting, "if ever doctrines should prevail here which teach that we need not rely upon our own energy and labor. We, the real workingmen and citizens, have been attacked by the so-called Workingmen's and Citizens' parties for believing that the working of the commune must stop where the activity of the individual begins. What will finally become of the citizen when he is deprived of one sphere of enterprise after another? We are crowded between two socialistic camps—the one looks to the potentates above, the other and lower one relies on being able to cheat the gentlemen at the head of affairs out of their dues. This election is like the verdict of a jury on the question of guilty or not guilty. We have been acquitted, and so gloriously that no one will dare to bring in a new charge." So it is. This memorable contest was stirred up by the Government not for the sake of the best possible attention to the communal administration, but for the control of the political power in the capital of the Empire. Bismarck's defeat is therefore well deserved, and cheerfully received by all independent men.

Besides the splendid festivals which have been celebrated in Germany within the last two months—most prominent among which was the unveiling of the colossal statue of Germania, on the Niederwald, near Bingen on the Rhine—there was a modest anniversary held at Crefeld in commemoration of the 200th return of the day on which the first association of German emigrants departed for the present United States. Permit me to describe it in a few words, as the fact may be of some interest to your readers too. It was at the instigation of no less prominent a man than William Penn that thirteen Quaker and Mennonite families of Crefeld and neighborhood in 1683 left their homes and settled at Germantown, the present Twenty-second Ward of the city of Philadelphia. These well-to-do people were inspired with high and elevated ideas; they wanted nothing more than to serve their Lord in their own way—men of superior character and intelligence, and trained in economic and industrial habits. For conscience' sake they sought homes in the Pennsylvanian forests, and proved an excellent acquisition to the new country. Crefeld is now a thriving silk-manufacturing city of nearly 100,000 inhabitants. Proud of her noble sons, the prominent citizens on October 6 paid their tribute of respect to those first German pioneers of emigration, and sent words of greeting to their German-American brethren who, at the same hour, were celebrating the day in Philadelphia. At a full meeting held in the largest hall of the city Dr. Friedrich Kapp, member of the Reichstag, delivered an address in honor of the occasion, and gave an exhaustive sketch of the political and religious causes which drove these Crefeld linen weavers, and after them millions of Germans, beyond the Atlantic. As an immortal memorial of them he praised that glorious protest which, as early as in April, 1688, was made by them against human slavery, and which places them on the same platform with the noblest abolitionists of our day. "You fully enjoy here the liberty of the soul," they said to their fellow-citizens: "do not be illogical, but grant the liberty of the body too; by upholding a cruel institution do not deter emigrants from Europe, and do not make the name of your young colony a shame and a by-word among thinking people." This first step, however, against the abolition of slavery was choked by the English-speaking Quakers, who declared it inopportune and impractical. This spirit of the Crefeld abolitionists, nevertheless, prevailed among the Germans in Penn's

colony for some fifty years. After them other emigrants from the Rhine, and especially the Palatinate, landed there, driven out by famine, wars, and the general desire of mending their fortunes. They were poor, oppressed people, these wandering sons of the beautiful Palatinate, who humbly plodded their way, unassuming and unpretentious, unable to gain and to occupy any public position. How have things changed since then! The other day, Mr. Henry Villard, also a son of the Palatinate, at the head of the first dignitaries of his adopted country, and surrounded by the most distinguished guests from Europe, drove the last spike in the rails connecting the East and the West of the American continent, *via* the Great Northern Pacific Railroad. † † †

Correspondence.

THE NEW EDITION OF EMERSON'S WORKS.

To the Editor of The Nation:

Sir: Your remark, in a notice of the new edition of Mr. Emerson's writings (*Nation*, Oct. 25), that you must think it a serious omission that the essays in the fifth and seventh volumes have no indication of the time at which they were composed, delivered, or first published, invites a word of explanation from me, since it appears to imply that the essays contained in these volumes ('English Traits' and 'Society and Solitude') were composed and delivered at definite times, ascertainable by proper inquiry. Now, it is true that lectures on England were delivered by Mr. Emerson at various times after his second visit to that country in 1847–8, and no doubt the sentiments and opinions put forth in those lectures were afterward published in the book. But it would be very difficult to ascertain when they were first written down, or what was the precise relation of the lectures to the book. Some sentences I recognize in his diaries of 1833, others in his journals of various times within the next twenty years. But, as I have explained in the preface to 'Letters and Social Aims,' Mr. Emerson constantly varied his lectures by the introduction of new matter, and I have no doubt that a good deal was added by him when he prepared the "copy" for the press; but no entire transcript for publication, so far as I am aware, now exists. The same is true substantially of 'Society and Solitude.' Two of the essays in that volume had appeared in periodicals, and this fact might have been mentioned. But I thought it better, on the whole, to keep the reprints of the essays which had been published in a collected form by Mr. Emerson as free as possible from editorial comment, and to reserve bibliographical details for a future occasion.—Your obedient servant,

J. E. Cabot.

Brookline, Mass., Oct. 31, 1883.

MR. GOLDWIN SMITH AND IRISH REPRESSION.

To the Editor of The Nation:

Sir: In his letter in your impression of today, headed "Repression in Ireland," Mr. Goldwin Smith deprecates a "Commission of Judges," and seeks "a tribunal of laymen selected for their character from the whole nation." He is perfectly aware what sort of people this tribunal would consist of — Lord Rossmores, Bence Joneses, and the like. The former is permitted by the English Government to threaten with murder the Nationalists when they propose to hold meetings which are perfectly legal, and which, when interfered with by the Lord Lieutenant, are prevented on pretexts which have no concern with legality. The magistrates and officials of Ireland are almost without exception landlords and aristocracy. The judges of the land might be too independent to act as a tribunal according to Mr. Smith's own heart, so he proposes his friends should judge in their own cause. At least, I presume, he had no intention of selecting his tribunal from the followers of Mr. Parnell—four-fifths of the nation. If so, I humbly apologize for my mistake. The "men of character" he alludes to have signalized themselves by plundering the people until the Land Act intervened. By a little "timely firmness" this robbery might have been mitigated some years ago and bloodshed arrested. But that "timely firmness" was only shown by the House of Lords when they threw out the Compensation for Disturbance Bill, and thus enabled the plundering to go on a little longer. Mr. Smith claims protection for loyal men and women from "gangs of barbarous and dastardly assassins." Robbery he does not mind; that is an innocent recreation. But how about the Orange mobs led by "men of character"?

I enclose my card.

An English Officer.

New York, November 1.

EXCLUSIVE PREFERENCE FOR THE CLASSICS.

To the Editor of The Nation:

Sir: It seems to me that the *Nation* altogether misses the point in its comments on the anti-Greek argument. If the study of the classics deserves the exclusive preference it has always enjoyed, well and good. Some of us think it does not; but, while denying most of their premises, we are able to follow and to appreciate the argument of such able defenders of it as Doctor Porter. But the *Nation's* comments are annoying because they are based on what seems to us an irrelevant circumstance—viz., that a large portion of Harvard and Yale undergraduates study, under all circumstances, as little as they can help. That is, a large portion of the cleverer and more industrious should be condemned to an intellectual treadmill because this is good enough for the idle or stupid.

The *Nation* assumes that the intrinsic difficulty of classical studies, or imperfect instruction, or both, are the reasons generally alleged for the substitution of modern languages. This is certainly an error. Mr. Adams frankly admits the excellence of classical culture—for those whose minds thrive on it. But why should the large number of boys who are disposed to study, but who have no liking for Latin and Greek, be condemned to study them? It is no answer to say that they are at liberty to give them up during the last two years of their college course. That means that they have been obliged to waste the six or seven preceding years—years which, for the study of language, are more valuable than any subsequent period, let alone the fact that six or seven years form no unimportant fraction of a man's life.

Let us afford those who wish to become philologists every facility for doing this, just as we should afford the same opportunities to embryo naturalists. As it is, the naturalists and physicists have little to complain of: they can, if they choose, go direct from a "common" school to a technical? But why, we ask, must those who wish to study a series of years before beginning a professional career be obliged to follow the curriculum suited to only two or three out of many professions? As it is, our colleges can and do graduate excellent classicists (may their number never be fewer!); they do not and cannot graduate persons really familiar with any modern tongue, except in those exceptional cases (like the "Cerberus" at Harvard ten years ago) where the student has obtained his preparation for college while living abroad. But if it were possible to give those (for language study) best years of fourteen to eighteen to French or German, who will deny that our colleges could turn out as good modernists as classicists?

Then, too, so far as my own observation proves anything, a good deal of the *vis inertiæ* which, as the *Nation* remarks, characterizes the majority of undergraduates, is due to the deadening consciousness of the uselessness of the studies pursued. For the majority of boys, I believe as heartily as Doctor Porter in the advantage of language study. But, except for the followers of a very few professions, the classical curriculum provides (when it provides anything) mental discipline plus nothing; while it is claimed that the study of German or French gives mental discipline plus positive knowledge of enormous advantage to many, and of some good to all. I, for one, shall always regard the careful instruction which I received at Exeter, and the very laborious hours which I gave there to Latin and Greek, not only as thrown away, but as a might-have-been of the utmost value.

W. M. G. (A.B., Harvard).

[The *Nation's* comments ought not to be "annoying," because they were not based on the "circumstance" that "a large portion of Harvard and Yale undergraduates study under all circumstances as little as they can help." It never alleged any such "circumstance." It simply said that a large proportion of them do not study enough to master Greek, Latin, or any other language—which is a different circumstance and very relevant. Moreover, the *Nation* did not "assume that the intrinsic difficulty of classical studies, or imperfect instruction, or both, are the reasons generally alleged for the substitution of modern languages." It said nothing about "reasons generally alleged." It was talking of Mr. Adams's reasons, and more especially of the chief of them, which was that neither he, nor his father, nor his grandfather, nor his great-grandfather, nor his two brothers, ever learned Greek enough at college to be of any use to them in the work of life, or even to enable them to study the Greek classics with pleasure or profit. Nor have we been arguing in defence of the classical curriculum, but against what we consider the chimerical notion that any change in the curriculum is going to make the bulk of undergraduates any more thoughtful, or industrious, or eager for mental discipline than they now are. Finally, as our correspondent admits the existence of the *vis inertiæ*, "which, as the *Nation* remarked, characterizes the majority of undergraduates," we are little puzzled to know what his thesis is. —Ed. Nation.]

ENGLISH AND AMERICAN PLAGIARISTS.

To the Editor of The Nation:

Sir: Many are the pitfalls dug for us poor buyers of books. One hates, for instance, to buy the same book twice, though it be a valuable one—so long, that is, as no dear friend has *borrowed* one's first copy. And so, to buy a book one has seen advertised by an author al-

ready favorably known, and to find that the self-same book, under another title, is already on one's shelves, is apt to occasion a feeling of chagrin. Similarly, to buy a book one has seen advertised as by one author, and to find the same, or nearly the same, already on one's shelves under another title, and by a different author, is to be made to feel that one has too hastily parted with one's money.

These reflections are aroused by a communication in the *Athenæum* of October 13 (No. 2,920), in which the writer shows that a certain book entitled 'The Development of English Literature and Language,' by Alfred H. Welsh, M.A. (Chicago: Griggs & Co.), is really, to a very great extent, a work published by himself and other well-known collaborateurs, under another title. The manner of showing this which Mr. T. Humphrey Ward, the writer of the communication referred to, adopts, recalls irresistibly to mind the exposure of Mr. Thomas Hardy's literary methods made by a correspondent of the *Nation* some time ago, wherein your correspondent showed how Mr. Hardy had arrived at some of the cleverest pages of his (?) novel, 'A Laodicean.' This communication had a wide circulation, for, besides what it got by appearing in the *Nation*, it was reproduced, *in extenso*, in the pages of the London *Academy*. Ever since it appeared, I have been afraid to buy anything by Mr. Hardy, lest I should be duplicating some of the volumes by which I am already surrounded.

This exposure of Mr. Welsh in the *Athenæum* reminds me to ask you, as I have often intended to do, whether Mr. Hardy has ever offered any justification of his methods, for, though I have been looking for some rejoinder from him, none has thus far met my eye.

CONSTANT READER.

BALTIMORE, October 30, 1883.

THE "RESOLUTIONS OF '98" AGAIN.

TO THE EDITOR OF THE NATION:

SIR: Your comments in the *Nation* of October 18 give precision to the points in issue between us concerning the historical meaning of the "resolutions of '98." You say that "Massachusetts, Vermont, New Hampshire, Connecticut, Rhode Island, Delaware, and New York, by action of their Legislatures, all denounced the secessionism of the resolutions of '98, interpreting them in the same sense in which they were understood in 1860." So far is this, I submit, from being an accurate digest of the facts in the case, that Mr. Madison, in 1830, cited the terms of these very legislative declarations for the express purpose of showing that the States which protested against the "resolutions of '98," did *not* regard them "as avowing and maintaining a right in an individual State to arrest, by force, the execution of a law of the United States." If they had so regarded the resolutions, he says, "it must be presumed that it would have been a conspicuous object of their denunciation" ('Writings of James Madison,' vol. iv., p. 106). These replies abound in general declamation and in specific accusations against the resolutions, but neither in the one nor the other do I find any fling at "secessionism," in name or substance.

The difference between the "resolutions of '98" and "secessionism" is accurately defined by Mr. Madison. Writing in 1833, he says:

"The case of the alien and sedition laws was a question between the Government of the United States and the constituent body [the States], Virginia making an appeal to the latter against the assumptions of the former. The case of a claim in a State to secede from its union with the others resolves itself into a question among the States themselves as parties to the contract. In the former case it was asserted against Virginia [by the protesting States] that the States had no right to interpose a *legislative* declaration of opinion on a constitutional point; nor a right to interpose at all against a decision of the Supreme Court of the United States, which was to be regarded as a tribunal from which there could be no appeal. The object of Virginia was to vindicate legislative declarations of opinion; to designate the several constitutional modes of interposition by the States against abuses of power; and to establish the ultimate authority of the States, as parties to and creators of the Constitution, to interpose against the decisions of the judicial as well as other branches of the Government—the authority of the judicial being in no sense ultimate, out of the purview and forms of the Constitution" ('Writings of James Madison,' vol. iv., p. 335).

If it be said that these remarks apply to the Virginia and not to the Kentucky "resolutions of '98," it suffices to say that the resolutions of both States are coupled in the same condemnation by the Legislatures of New York and New Hampshire. But nowhere, in the condemnation of any State, do I find a hint of "secessionism," which you accurately define in your review of Mr. Curtis's 'Life of James Buchanan,' and in your comments on my communication.

The Kentucky "resolutions of '98" *are* more trenchant than those of Virginia. In the form in which they were originally drafted by Mr. Jefferson they contained an appeal to the natural right of revolution. In *that* form (never adopted by Kentucky) it was held that when the Federal Government assumes powers "which have not been delegated, a nullification of the act is the rightful remedy; that *every State has a natural right*, in cases not within the compact (*casus non fœderis*), to nullify, *of their own authority*, all assumptions of powers by others within their own limits." You say that "there is no real dispute that prudence alone suppressed this resolution," and thereupon you immediately add, "in the following year *it was passed, making the whole complete again.*" (The italics are mine.) That is, you affirm that the two following propositions, respectively contained in the Kentucky declaration of 1798 and 1799, are substantially identical:

Clause in series of 1798, *as not adopted:* "*Every State has a natural right*, in cases not within the compact (*casus non fœderis*), to nullify, *of their own authority*, all assumptions of powers by others within their own limits."

Clause in resolution of 1799, *as adopted:* "The several States who formed that instrument [the Constitution], being sovereign and independent, have the unquestionable right to judge of the infraction, and a nullification *by those sovereignties* of all unauthorized acts done under color of that instrument is the rightful remedy. . . . Although this Commonwealth, as a party to the Federal compact, *will bow to the laws of the Union*, yet it does at the same time declare that it will not now, or ever hereafter, cease to oppose, *in a constitutional manner*, every attempt, at what quarter soever offered, to violate that compact."

Where you see identity I see a great difference between these two propositions. The former affirms the right of "every State," therefore of each single State, to nullify a Federal law "in cases not within the compact," and derives that right not from the Constitution but from "nature." The latter affirms the right of "the several States *which formed the Constitution*," therefore of the States collectively, to nullify unauthorized acts "in a constitutional manner"—a mode of safety and redress which lies within the lines of the Constitution, and has been exercised again and again in our national history. But neither of these propositions symbolizes with the doctrine of the latter-day disunionists, for whereas the former clause deduces the right to nullify from the law of nature, the disunionists of 1860 deduced it from their theory of the Constitution; and whereas the latter clause contemplates a nullification wrought by the combined action of all the States, agitating for change "in a constitutional manner," the disunionists of 1860 contended for a nullification or a secession to be effected by the act of any State *in its separate capacity*, and exercising then only its reserved right under the Constitution.

When you say that "there had been no dispute about the right to do every one of the five things" formulated by me from the debates in the Virginia House of Delegates on the passage of the "resolutions of '98" through that body, I venture to say that you speak unadvisedly. A question *was* formally raised by the Federalists against the first named of those "things"—a yea and nay vote was called on it—and the same question reappears in the replies of the protesting States. Indeed, it was the gravamen of *all* the opposition offered to these resolutions in Virginia, in Kentucky, and elsewhere, that, in assuming to make *legislative* declarations against the constitutionality of certain statutes, they encroached on the functions of the Federal judiciary, and on the individual right of the people to petition for redress. Beyond these points the opposition wasted itself in vague declarations against the "pernicious *tendency*" of the resolutions. But "secessionism" is not once named in these protests, so far as I can discover.

You say that the real question involved in the political discussions of 1798 was this: "Could a State, regarded as a separate sovereignty, an original party to a compact, nullify that agreement, or laws passed by the Federal Government under it, *without* securing repeal either through Congressional action or Constitutional amendment?" I affirm that, so far as my knowledge extends, no such issue was formulated, or understood to be formulated, in that whole discussion, whether as conducted by the friends or the enemies of the "resolutions of '98," and whether as waged over the series passed in Kentucky or the series passed in Virginia; but I hold this opinion subject to correction on the presentation of contemporaneous proof to the contrary from any document, book, pamphlet, letter, or newspaper relating to that topic. When you add that "the resolutions are empty of meaning if they did not refer to this," you speak positively but too narrowly in the face of scores of contemporaneous witnesses who testify to an entirely different meaning and purpose in these resolutions. For a signal illustration of such different meaning, I point to the trial of Callender, at Richmond, under the alien and sedition laws, after the passage of the "resolutions of '98," and to the report made upon it by Governor James Monroe in his annual message to the Virginia Legislature next ensuing after that trial. In that message he gives an interpretation of the resolutions which has the merit of being contemporaneous, precise, and authoritative.

I regret that in closing and clenching your remarks with a supposed citation from the Kentucky "resolutions of '98" you have been misled by inadvertently quoting from a mutilated copy. Such copies abound in the political literature of a later day, when men have often garbled the resolutions to make them sound like "secessionism." The mutilated clause, as you quote and italicise it, is given as follows:

"Whenever the general Government assumes undelegated powers, its acts are *unauthoritative, void, and of no force;* that to this compact [the Constitution] each State acceded as a State, and is an integral party; that this Government, created by this compact, was not made the exclusive or final judge of the extent of the powers delegated to itself, since that would have made its discretion, and not the Constitution, the measure of its powers; but that, *as in all other cases of compact among parties having no common judge*, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress."

This language imports that the "each party" which is said to have an equal right to judge, "for itself," as well of infractions as of the mode and measure of redress, is each separate State, *irrespective of the judgment and control of the other States.* But the text of the resolution, *as unmutilated, affirms exactly the contrary.* Let me reproduce the clause in its textual integrity. It reads (I put the omitted parts in small capitals):

"Resolved, . . . that whensoever the general Government assumes undelegated powers, its acts are unauthoritative, void, and of no force; that to this compact each State acceded as a State, and is an integral party, ITS CO-STATES FORMING, AS TO ITSELF, THE OTHER PARTY; that the Government created by this compact was not made the exclusive or final judge of the extent of the powers delegated to itself, since that would have made its discretion, and not the Constitution, the measure of its powers; but that, as in all other cases of compact, each party [*i. e.*, each "State" and its "co-States"] has an equal right to judge for itself as well of infractions as of the mode and measure of redress." (See Bache's *Aurora*, Dec. 10, 1798; H. Marshall's 'History of Kentucky.' Frankfort, Ky. 1824. Vol. ii., p. 255.)

The "each party" *here* designated and defined is not each State acting for itself, irrespective of the judgment and authority of its "co-States," but each State standing in the presence of, and under the acknowledged judgment of, *all its sister States*, who, "as to itself," are styled "the other party," and who, as such "other party," are equally entitled to sit with it in scrutiny on any proposed mode and measure of redress. It would be impossible for language to be more precise or explicit against the whole pretension of the later disunionists. And now we see why it was that the "Resolutionists" of Kentucky and Virginia sent a copy of their declarations to each and all of the "co-States"; for these latter were "the other party" with whom Kentucky and Virgina had to account, and by whom the alleged "infractions" and the proposed "mode and measure of redress" were to be canvassed on the basis of "an equal right to judge." And now, too, we can see why John Taylor, of Caroline, speaking for his political associates in the Virginia Legislature of 1798, was compelled, in consistency with the logic of these ideas, to hold the following language: "Are the Republicans possessed of fleets and armies? If not, to what could they appeal? *To nothing except public opinion. If that should be against them, they must yield.*" (See "The Virginia Report," etc., Debate of December 20, 1798, p. 113, as republished, Richmond, J. W. Randolph, 1850.)

JAMES C. WELLING.

WASHINGTON, October 20, 1883.

[We had not expected that the discussion of a purely collateral question would lead so far from the subject of the review which started it; but the topic is an interesting one, and in treating it the facts of history must be fairly faced, *coûte que coûte*. We shall try, however, to be very brief in noticing the principal points made by Mr. Welling.

First, as to the mistake in quoting the Kentucky resolution. We copied from the resolution as passed by the Legislature and as given by Elliott, attested by the proper State officers ('Debates on the Constitution,' iv., 540). Mr. Welling has given the words of the original *draft* as found in Jefferson's works (vol. ix., 464). This makes unnecessary any further answer to the statement that the resolutions have often been garbled to make them sound like secessionism. No doubt they will be found in forms of varying inaccuracy, but unless the archives of State are searched anew, we know of no test of authenticity stronger than the copy with State officers' names attached, which Elliott gives.

Second. If the resolution had been passed in the form it had in the draft, we should only say, So much the worse for the resolution. A similar difference is found in comparing the draft of the Virginia resolutions with the adopted form. In the former "the States *alone*" had been declared to be the parties to the compact. This was opposed on the ground that it ignored the national existence and denied that the United States Government had any part in the Constitution as an agreement. The supporters of the resolution were obliged to yield, and the "alone" was struck out. So with the draft of the Kentucky resolutions, as quoted by our correspondent: it was a bolder and more explicit avowal of the same doctrine. It said that as to each State, its co-States formed "*the* other party," not *another*: there is no room for a third. The very existence of the Union as a real and corporate entity was thus denied, and the continuing consent of each State is made the immanent cause of the continuing life of the Union, for any purpose, as certain philosophers hold that the will of God is the immanent cause of the continuing existence of the universe. Neither Virginia nor Kentucky was prepared to go quite so far: hence the difference between the drafts and the adopted resolutions.

Third. The interpretation Mr. Welling argues for is the opposite of that which a logical analysis would demand if the form of the resolution had been as he assumes. If *each* party is judge of infractions, etc., and each State is one party, while the other States form the "party of the second part," it is too plain for argument that each State *may* judge "irrespective of the judgment and control of the other States." We suspect that our correspondent has confused this with another point sometimes made on the use of the plural word "States" in the Virginia resolutions. In connection with this we will say, in answer to another verbal criticism, that we certainly understand "every State" and "the several States" to mean the same thing. The word *several* is evidently used in its legal sense of "taken separately." The connection requires this, as is shown by what we have above noted in reference to "each party."

Fourth. Mr. Welling appeals to contemporaneous interpretation of the resolutions. We will refer to this in a moment, but must first say that the approved canon of interpretation is, that extraneous matter ought not to be used when the language of the instrument is unambiguous. Here is no ambiguity. The resolutions of Kentucky place no limit to the authority of each State to judge either of the infractions or of the proper redress. If the State shall regard secession as the proper mode or measure of redress, the resolutions declare the full authority to secede. Secession or nullification is thus made a question of expediency alone.

Fifth. Declarations of the constitutionality of what is done or intended do not change the character of any act. Calhoun declared his theory of nullification strictly constitutional, and Davis and his followers said the same of their acts in 1860.

Sixth. As to contemporaneous interpretation of the Kentucky resolutions in regard to secession, no authority is so conclusive as that of their author, and we will furnish it. In his letter to Wilson C. Nicholas, of September 8, 1799, Jefferson, after advising moderate present action, reserving the right "of doing in future whatever we might now rightfully do, should repetitions of these and other violations of the compact render it expedient," goes on to say that their attitude should be "that, not at all disposed to make *every* measure of error or of wrong *a cause of scission*, we are willing to look on with indulgence and to wait with patience," etc. (Jefferson's 'Works,' iv., 305). A trained logician, like our correspondent, will hardly deny that the "scission," or secession, which is refrained from as a matter of indulgence and an exercise of patience, is claimed as a right. We will add to this the opinion of a still greater man, the great leader of patriots and of the moderate men of his time. Washington, writing to Patrick Henry on January 15, 1799, said ('Works,' xi., 388) that the leaders of the Opposition were not only opposed to the General Government, but by the tendency of their measures would destroy the Union. It was therefore that he urged Henry to return to public life, saying: "At such a crisis, . . . when measures are systematically and pertinaciously pursued which must eventually *dissolve the Union, or produce coercion*, . . . ought characters who are best able to rescue their country from the pending evil to remain at home?" He closed the letter with these words: "My fear that the tranquillity of the Union, and of this State in particular, is hastening to an awful crisis, has extorted this from me." We find it difficult to see how Mr. Lincoln could have used much plainer language in 1860. If it be desired to see how the charges of secession and nullification were "formulated" by the leader of the party then in a majority in the United States, we will refer to Alexander Hamilton's works, vi., 348, and, could we afford the space, there is no dearth of material in many other quarters.

Seventh. We cannot retract our assertion that the answering resolutions of the other States give the same meaning to the declarations we are considering. New York declared them "sentiments and doctrines no less repugnant to the Constitution of the United States and the principles of their union, than *destructive to the Federal Government.*" Rhode Island said it was not only "hazarding an interruption of the peace of the States by civil discord," but leaving to a State "no resort for vindicating its opinions *but the strength of its own arm.*" Massachusetts declared that "should the respectable State of Virginia persist in the assumption of the right to declare the acts of the Government unconstitutional, and *should she oppose successfuly her force and will to those of the nation*, the Constitution would be reduced to a mere cipher." When these are read in the light of the history of the time there is but one interpretation for them, and Washington's phrase, "awful crisis," was none too strong.

Eighth. What we have said ought, as it seems to us, to be enough to make the defenders, even of the Virginia resolutions, feel that this is a fit matter for the application of the homely proverb, "Least said, soonest mended." But we again call attention to the fact that we waived discussion as to the Virginia resolutions, and explicitly directed our original remarks to those of Kentucky. The indefensible character of these last is in no other way more plainly shown than in the manner in which they were treated by Benton in his discussion of nullification in his 'Thirty Years' View.' In the resolutions introduced by Calhoun into the Senate in the winter of 1832–33, and which brought on the crisis at that time, the apostle of disunion made the Kentucky resolution which we quoted in full in our last article the doctrinal foundation of the set brought forward by him, copying its most essential phrases verbatim. But Benton, in his answering argument, says that "the *Virginia* resolutions of '98–'99 were the assumed source of the power" of nullification, and that from them Calhoun "obtained the seminal idea." He then devotes his strength to the attempt to explain away the obnoxious doctrine from the Virginia series, quoting them alone, and making no reference whatever to those of Kentucky, except when he attempts to show that Jefferson had nothing to do with the nullification resolve of '99—an attempt which came to lamentable grief when Jefferson's works were published and were found to contain the original draft of this also, and in a form which Mr. Welling thinks much worse than that in which it was adopted, though we confess we can see no substantial difference. Such a treatment of the subject as Benton's, whatever we may think of its shrewdness, is a pretty plain confession that he, at least, could find no way of defending the Kentucky resolutions. Fortunately the time has at last come when the nationality of the United States can never again be questioned, and the Union could not now be endangered, as Benton evidently thought in his time it would be, if Jefferson and Madison both are brought to bear the responsibility of their conduct in 1798 before a public opinion enlightened by impartial historical criticism.—Ed. Nation.]

Notes.

Harper & Bros. have in press 'God and the Future Life: the Reasonableness of Christianity,' by Charles Nordhoff.

The first number of *Shakespeariana* (Leonard Scott Publishing Co., 41 Barclay Street) bears date of November, and is a fair beginning. The contributors are apparently wholly American. We think the typographical aspect less attractive than it might have been made. The special departments are Notes and Queries, the Drama, Shakespearian Societies, Reviews, Miscellany. A bibliographical sketch of the late John Payne Collier is furnished by Mr. J. Parker Norris. Six Shakspere societies or clubs are named—one in Cambridge, Mass., one in New York, two in Philadelphia, one in Atlanta, Georgia, and one in Montreal.

Some notice might fitly have been taken, in this number of *Shakespeariana*, of the Parchment Library Shakspere, already in its tenth volume, which contains "Macbeth," "Hamlet," and "Lear" (D. Appleton & Co.).

The same publishers have printed William Cobbett's English Grammar, edited by Alfred Ayres. It is but a short time ago that we noticed a life of Cobbett, also published in this city, to which the Grammar was appended. The present edition has some advantages in being apart from any life, and it is also a very pretty book, albeit in rather fine print. Mr. Ayres, in his preface, lays great stress on an "improvement" which he advocates (following, we believe, Mr. E. A. Abbott, author of the 'Shakspearian Grammar'), and which is an attempt to fix the usage of the relative *that*, so as to avoid ambiguity. The ambiguity, however, is in most cases avoided by a simple rule of punctuation, while the writer's choice (especially if he be a poet) between *that*, *which*, and *who* will always be primarily determined by euphony. Mr. Ayres has supplied a convenient index.

It is a crucial test of a modern lantern lecture to be committed to print. This has been done in the case of Mr. John L. Stoddard's lectures ('Red-Letter Days Abroad.' Boston: J. R. Osgood & Co.), and nobody would mistake the result for a genuine book. The pointer is constantly felt, if not seen. Mr. Stoddard talks fluently of Spain, Ober-Ammergau in 1880, St. Petersburg and Moscow, and the volume is freely supplied with engravings after the slides which the stereopticon puts upon the screen in Mr. Stoddard's courses. These illustrations are fresh and well executed.

Mr. William Still, 244 South Twelfth Street, Philadelphia, has brought out a new edition of his singularly interesting work, 'Underground Railroad Records.' It will be long before the story of the systematic aid given to fugitive slaves at the North loses its romance, or fails to arouse wonder and pity in the breast of the reader. Mr. Still's narrative covers the Middle State section of the "Underground Railroad," as Levi Coffin's autobiography does the Ohio Valley section, while the Eastern operations have yet to find a chronicler. The book has an enduring place among the sources of American history during the nineteenth century. Its biographical sketches of leading abolitionists distinctly enhance its value.

A "Calendar of American History," with ornamented card and block of daily leaflets, has been compiled by Delia W. Lyman, edited by the competent hand of Mr. Henry P. Johnston, and published by G. P. Putnam's Sons. A box accompanies the block, for the preservation of the leaves as used, but one may doubt whether many will be so prudent and wisdom-loving.

In the November number of the *Magazine of American History* Mr. Alfred M. Williams's paper on "General Houston's Life among the Indians" is at least as interesting and as valuable as any in the table of contents.

Mr. Josiah Emery begins, in the *Granite Monthly* (Concord, N. H.) for October, a list of earthquakes in New England, Canada, and the Provinces, from 1638 to 1883, which was well worth making. It is not a mere record of dates, but has a certain readability.

The volume of the Washington Astronomical and Meteorological Observations for the year 1879 has just appeared. It contains, as usual, the observations made with the transit circle and the two equatorials; but, in accordance with the plan adopted a few years ago at Greenwich, and more recently at Washington, the observations are given in a much more condensed form than in the earlier volumes. In the meteorological section, also, the same plan has been adopted for the first time, and only the results of the observations are given. That these changes are for the better will be acknowledged by every one who has been accustomed to consult the Washington observations frequently. The volume has two appendices, the first of which, by Prof. Asaph Hall, contains a very interesting discussion of the extensive series of observations which Professor Hall made on α Lyræ and its companion, and sixty-one Cygni and a small star near it, to determine the relative parallaxes of each pair. Professor Hall's results substantially confirm the results of preceding investigations on these stars. The second appendix contains a determination of the semi-diameter of the moon from two occultations of the Pleiades in 1877 and 1879, by Prof. H. M. Paul, sometime assistant astronomer at the Naval Observatory, and late Professor of Mathematics and Astronomy in the University of Tokio, Japan. These occultations have been very skilfully discussed by Professor Paul, and the paper may be regarded as a valuable contribution to the literature of the most puzzling and baffling problem of physical astronomy, the lunar theory.

The October Bulletin of the Mercantile Library of Philadelphia gives a timely list of references to works on Luther and the Restoration, by the librarian, Mr. John Edmands. Though limited to works accessible to the patrons of the Library, it is, of course, of general utility.

The unusually low proportion of fiction to other classes of literature issued by the Mitchell Library, Glasgow, which we lately commented upon, seems to find its explanation in the fact that the library has only a small number of works of fiction. The managers, without excluding fiction altogether, seek to supply the public with works of utility rather than of mere entertainment. There is considerable demand for fiction among the frequenters of the library. In 1882 the "turnover," or number of times the whole of the works belonging to the class fiction was issued, was 97.93, while the turnover of the class history and biography was 19.51.

There has recently been published in London the second edition of a tiny little volume by Mr. C. T. Buckland, called 'Whist for Beginners' (London: W. H. Allen & Co.; New York: Scribner & Welford), which may be highly recommended to all who desire to learn the art and mystery of the modern game, and who may have been deterred from the more elaborate treatises of Cavendish and Clay by the preliminary experience and knowledge of the game which these works demand. Mr. Buckland begins at the beginning, and shows the novice how he ought to play at each stage of the game, and why he ought to play thus and not otherwise. His instructions are plain and simple, and easy to understand. The player who has mastered his thirty-two paragraphs—for the book is brief enough to be read through in ten minutes—ought to be able to play whist fairly well, and he certainly is ready for the higher mathematics of Cavendish and J. C.

—Dodd, Mead & Co. have published an exceptionally fine edition, in three volumes, of 'The Dramatic Works of Richard Brinsley Sheridan,' with an introduction by Mr. Richard Grant White. The printing has been done by Theodore L. De Vinne & Co., who sign and number every one of the 30 copies on Japanese paper, and of the 318 on Dutch paper. The books are sent out with uncut tops and rough edges, and cased in neat boards with paper labels, much as books were always sent out before the invention of cloth binding. There is an etching in each volume, by way of frontispiece, by Mr. G. W. H. Ritchie; but of these the least said the better. That to the first volume reproduces the famous portrait by Sir Joshua Reynolds, now in the possession of Lord Kennaird, and that to the third volume is a copy of the scarce engraving after Corbould. The text is an exact reprint of

the Murray edition of 1821, which bore Moore's name, although he disclaimed having had anything to do with it, and therefore we find in the first volume the worthless farce of "The Camp," long attributed to Sheridan, although it was really the work of his wife's sister's husband, Tickell. Mr. White's introduction fills some forty pages, and is, of course, lively and entertaining, but cannot be relied upon implicitly. For instance, Sheridan's early friend, Halhed, who lived to be a distinguished Orientalist, figures here as "Haled." And now and again we feel compelled to dissent from Mr. White's judgments —the assertion, for example, that Sheridan had no humor, and the declaration that the "Critic," which divides with the Garrick-Townley "High Life Below Stairs" the honor of being the best farce in the English language, does not rise "to the plane of literature." But in general Mr. White is more generous to Sheridan than he has been to Shakspere, and some of his criticisms are not without value. He shows, for one thing, how slight was Sheridan's share in the alteration of the "Relapse," acted as the "Trip to Scarborough," and he has a pertinent passage on the want of permanent value in Sheridan's orations. But we should like to have chapter and verse for some of the highly apocryphal anecdotes with which Mr. White has freely enlivened his essay.

—We confess our capacity to welcome without a blush, and to admire freely, the uniform edition of Matthew Arnold's prose works manufactured abroad by Messrs. Macmillan exclusively for the American market. We pity only the English public which is denied it. For the intrinsic worth of its contents as well as for the example which it sets of handsome yet cheap bookmaking—for its example as well as for its contents—we welcome it with both hands. If there is any political maxim or policy which hinders our getting such works in abundance, we are opposed to it. If the republic has suffered any harm by reason of this happy thought of the English publishers, we cannot calculate it. In an essay in one of these seven volumes, on Copyright, Mr. Arnold even gives in his adhesion to an American idea that international copyright should be accompanied by the condition of manufacturing in the country which protects. He concludes by saying: "The Americans ought not to submit to our absurd system of dear books. I am sure they will not; and, as a lover of civilization, I should be sorry, though I am an author, if they did. I hope the Americans will give us copyright. But I hope, also, that they will stick to Michel Lévy's excellent doctrine: 'Cheap books are a necessity, and a necessity which need bring, moreover, no loss to either authors or publishers.'" One more quotation from this same essay will perhaps still further conciliate purchasers: "I have never received, from first to last, a hundred pounds from America, though my books have been, I believe, much reprinted there." As we said in announcing this edition, the Poems are wanting, though American admirers of them are not. The handy form, clear print, and comely binding in wine-colored cloth make the present series equally fit for ornament and for daily use.

—Our readers know of the wars of the boarder and the cottager, and of the complaints of the lover of nature that so little nature is left accessible to him. It is slight satisfaction to see that the French are as badly off as we, in a different way. The success of Trouville has led to the establishment of similar watering-places, with gigantic hotels, fine villas, casino, and all that this implies in the way of balls, and concerts, and plays, and fairs, and juggling, to say nothing of races and pigeon-shooting and the like. This is not what we want, says the lover of nature; we go to the seaside for the sea. We can hear Mme. Judic and Mme. Théo and Mlle. Garnier in Paris all winter long. Why should we travel a great distance, at considerable expense, to hear them all summer under less favorable circumstances? No sooner have we found a quiet nook with a little beach, where one can bathe and the children can dig to their heart's content, where fashion is unknown, where the boys can go barefoot and madame wear a *peignoir* all day, where meat is still fourteen sous a pound, and butter twenty-four, and the primitive inn charges only four francs a day, with no extras—no sooner have we discovered this paradise than some indiscreet person lets out the secret in the hearing of a speculator, and straightway a company is formed which replaces the humble *auberge* with a palace of three hundred rooms, and prices in proportion, and manners to correspond. No more bare feet, no more *peignoirs*. The picturesque basalt and the colored granite are blasted to build the walls; the undulating ground is laid out in regular terraces, the woods are cut down to supply funds. Oaks and elms, willows and poplars, give place to wretched plantations of sycamores which will not grow. Straight boulevards bordered by pretentious houses take the place of winding country ways, with their charming cottages with moss-covered roofs. Even if the speculation fails, and the great hotel is left empty—which the lover of nature may be pardoned for hoping it will—the place is ruined for ever. If the venture succeeds, a new evil follows which does not generally accompany our watering-places. The pretty brook that flows through the neighboring valley is seen by some visitor to be just the place for a factory and the foundation of a philanthropic *cité ouvrière*. The reeds and the ferns and all the rustic beauty are gone, and the lover of nature as well as the man with a slender purse must move on to some yet uncorrupted fishing village, which it is becoming difficult to find. The very churches yield to this incursion of Parisian civilization. The ancient Gothic church of the village, sheltered by venerable trees, and filled with curious inscriptions, no longer suits the curé; he gets up a subscription among the fashionable visitors and rebuilds it. What little is left of old French costume disappears at the same time. "Formerly," says the writer from whose long jeremiad we have condensed this statement of evils—"formerly, when one came back from England, one was refreshed by the sight of those pretty little headdresses, white as snow, which gave so neat and attractive an air to the faces they enclosed, and made one forget the feeling of sadness and disgust inspired by the shabby clothes and bonnets adorned with hideous artificial flowers that one had seen on the drunken women in the London streets. But now the peasant wears the old bonnets and last year's dresses left behind by the summer visitors. You may see them going from house to house to collect food for the pig, which is the only being that has not yet been metamorphosed."

—Detailed descriptions of the funeral of Ivan Turgeneff make it clear that the organs of the Russian Government did their best to render the national celebration a pedantically stiff and lifeless affair, and turn it as much as possible into a pageant with which the Church was mostly concerned. The demeanor of the public, however—and all Russia, from the Vistula to the Amoor, was represented by delegations—was all that could be expected under the aggravating circumstances. The whole nation paid silent, dignified, worshipful homage to its most illustrious representative before the world, and scrupulously abstained from anything calculated to provoke the least collision with the gendarmerie or the troops, who covered the capital, and to mar the honors bestowed upon the memory of the dead by converting his coffin into a signal for a political demonstration. All unofficial Russia bore emblems of mourning, except—among things visible on the surface—Katkoff's Moscow *News* and his friend Ivan Aksakoff's *Russ*'. Aksakoff, the fanatical Slavophil, acted no doubt from principle, deeming it sinful to express admiration for the career of a Russian whose sentiments and political convictions were so much in harmony with those of the west of Europe, and who preferred the banks of the Seine to those of the Moskva for his permanent abode. Katkoff's rigid coldness on the occasion is generally ascribed to a personal grudge; for, years ago, when Turgeneff appeared at St. Petersburg to participate in the celebration of the unveiling of the poet Pushkin's statue, the reactionary journalist suffered the affront of the novelist's refusing at a banquet to drink with him to the reconciliation of all parties. Katkoff, who, twenty years ago, succeeded in destroying the extraordinary prestige which surrounded Alexander Hertzen, evidently now deems himself strong enough to stem the powerful current of affection for Turgeneff which all Europe shares with Russia.

—Strong in his standing in governmental and court circles, he was not satisfied with ostentatiously abstaining from partaking in the national demonstrations of grief and mourning, but had the boldness to assail directly the memory of the idolized liberal novelist, while his dead body was being conveyed homeward to be buried, as he had wished it, between the remains of Bielinski and Dobroliuboff. The weapon for attack was eminently well chosen. Turgeneff's fame rests in part on his pictures of Nihilism, intended both to reveal and combat that shadowy monster. Now, Katkoff published in the Moscow *News* a letter of Peter Lavroff, the editor of the Nihilistic journal *Vpered* (*Forward*), published in London, in which the startling revelation was made that Turgeneff had for years contributed an annual subsidy of 500 francs for the maintenance of that organ. Lavroff probably revealed this secret in order to make capital for his sect, and also to induce the Russian Government to prohibit the solemn celebration of Turgeneff's funeral—a prohibition which might have led to seditious outbreaks. The truth of the statement Lavroff's known character made it hard to impugn. Its force, however, was blunted by explanations of two intimate friends of the deceased, men of high standing, to the effect that the subsidy was paid to Lavroff as an old personal acquaintance of Turgeneff, and paid only because the latter was afraid of the suspicion of avarice and hypocrisy if he refused help to the struggling exile under the pretext of a vital difference in their political opinions. The Government was wise enough to show its forbearance by ignoring Lavroff's communication, and the public was more shocked by his indiscretion than by the surprising evidence of Turgeneff's lack of firmness in standing by his well-known principles. Katkoff himself eventually came out with another explanation, according to which Turgeneff's contribution to the funds of the *Vpered* was paid as a kind of yearly ransom, insuring his personal safety from attacks at the hands of fanatical antagonists.

—Heine's much-talked-of memoirs are at last to be published, though their authenticity is still a matter of discussion in German and French newspapers. The owner of the manuscript, M. Henri Julia, it seems, has received several offers

from prominent Leipzig and Berlin publishers, and, among others who have expressed their faith in the authenticity of the memoirs, M. "Paul d'Abrest" has written a long article in *L'Événement*, in which he relates their early history. He says that Alfred Meissner, one of Heine's most intimate friends, who always expressed himself as convinced that the memoirs existed, used to refer to M. Julia as a witness to the fact. On the other hand, the Paris correspondent of the *Schlesische Zeitung* throws strong doubts on the genuineness of M. Julia's manuscript, which, he asserts, has been vainly offered to more than one German publisher; and Baron Gustav Heine, in Vienna, maintains, as before, that he alone is in possession of his brother's memoirs, that he has no intention of publishing them, and that M. Julia's manuscript is a forgery. Furthermore, a niece of Heine living in Berlin writes to the *Börsen Courier* that M. Julia was never very intimate with the poet, that he is not, as stated, the executor of his widow, and that he simply bought of Mathilde's heiress whatever manuscripts had been in the possession of the former. They consisted, she asserts, solely of matter which has already appeared in print, and of letters from Heine's friends. Still other opinions are heard. It will be remembered (see *Nation*, No. 930) that, immediately after the death of Mathilde Heine, Herr Gustav Karpeles, a competent authority, expressed in the Berlin *Gegenwart* his conviction of the authenticity of a small manuscript in Mathilde's possession, entitled "Meine Memoiren," while pronouncing it, however, of slight literary value, since it was merely a rough draft of the work in Baron Gustav Heine's hands. In a few weeks light will be thrown on this curious matter, for a counterfeit of Heine, if attempted, is not likely to be successful.

—The first important concert of the season was given on Saturday evening in the Brooklyn Academy of Music. Until within a year or two our orchestral concerts were generally preceded by a dozen or more semi-private concerts, given by music teachers and others, chiefly for the sake of the publicity gained thereby. These entertainments have fortunately disappeared, so that concert-goers may now enjoy the privilege of receiving their first impressions after the vacation from the superb body of instrumentalists composing the Philharmonic Society. So thoroughly have these artists been trained by Mr. Theodore Thomas that they were able to play at the Friday afternoon public rehearsal with a precision, rhythmic swing, and delicacy which make the statement appear almost incredible that they have not been playing together for several months; and at the evening concert there was added the warmth of feeling and the poetic glamour which can seldom be conjured in the day-time. The opening piece was the Eroica Symphony, in which an interesting and, as the result proved, justifiable experiment was tried. Our modern orchestras are larger than they were in the days of Beethoven, the addition of complemental brass instruments rendering it necessary to increase the number of violins. If all these strings are retained in the performance of a classical symphony—and it is desirable that they should be retained—it is necessary to increase the number of wood-wind instruments so as not to disturb the proper balance of parts. This was done in the Eroica, and the result was a richness and sonority very agreeable to the ear. When a conductor takes liberties with a score in accordance with principles that would doubtless have induced the composer to do the same thing under the same circumstances, no one but a petrified pedant would object to them; and such pedants fortunately do not seem to exist in this country, although there are plenty of them in the Old World. The Eroica was followed by an air from Handel's "Theodora," sung by Mme. Trebelli. It was not a happy selection, for Mme. Trebelli is not an oratorio singer, and Handel's arias have less individuality, as a rule, than a number of leaves picked from the same tree. But when she subsequently sang "Che farò," from Gluck's "Orpheus," all the beauty of her voice and her powers of dramatic expression were made manifest. The audience applauded with unusual enthusiasm. Between these two vocal pieces came the novelty of the occasion, the Scotch Rhapsody "Burns," by Mr. A. C. Mackenzie. It contains three connected movements, Molto maestoso, Andante, and Vivace, and is based on three poems of Burns: "Scots, wha hae wi' Wallace bled," "She's fair and fause that causes me smart," "I cott a stane o' haslock woo'." As the name indicates, it is an instrumental fantasia in which a few melodies are joined together so as to form a mosaic colored with a few national peculiarities, including a short phrase suggesting a bagpipe, without which, of course, no piece of the kind would be acceptable. The rhapsody is interesting, and shows that the composer is a master of the art of instrumentation, as might be expected of one who wrote an opera in conjunction with Mr. Hueffer, the ablest exponent in England of the principles of the modern music drama. This opera, "Colomba," was produced in London last winter with success, and is now being performed by Mr. Carl Rosa in various English cities. Mr. Thomas has shown on various occasions that he is not unduly partial to German music, but is anxious to secure interesting novelties from every available source. In this respect he is like his great Viennese colleague, Hans Richter, who has also repeatedly given Cowen, D'Albert, and other English composers an opportunity to be heard outside of London. It is evident that there is much greater promise in the works of these younger composers than there ever was in the Mendelssohn echoes collated by the older English composers, Bennett, Benedict, Macfarren. They derive their inspiration from all the great masters of different countries, and base their instrumentation on the two best models, Wagner and Berlioz. Berlioz, it should be added, was represented at the concert from which we have thus digressed by the charming ball scene from "Romeo and Juliet."

ANTHONY TROLLOPE.

An Autobiography, by Anthony Trollope. Harper & Brothers.

MR. TROLLOPE'S Autobiography takes a hold upon the reader at the beginning, and keeps it to the end. While it is, as a matter of course, not free from his marked peculiarities of style, it is exceptionally free from the faults that make some of this author's books at times so wearisome: chief among them being a tendency to prolixity and repetition. Of this tendency there are a few slight traces at the outset, but they disappear as the work progresses. There are no dull or tedious or even heavy pages, although some of the chapters are taken up with the discussion of political and social questions not rigidly within the scope of the book. The peculiar charm is owing in great measure to the consummate art displayed in telling the story. Thinking it all over, one finds that Mr. Trollope had not much more of a story to tell than Mr. Canning's knife-grinder, but what he has to tell is told with great skill. This seems a surprise, for we have never been accustomed to regard Mr. Trollope as a literary artist. It appears, however, that he has always attached great importance to style. He recurs to this point again and again. He dwells upon the necessity of writing in pellucid language, of being intelligible and harmonious. This he considers to be more essential in novels than in other works. A reader may take trouble, he says, to get at the meaning of a history or a book of science, because such books are read from a sense of duty and from motives of self-improvement; but a novel is read for pleasure only, and if it cannot be read with pleasure the reader will not go on with it.

Another quality flavors the Autobiography, which is far from abundant in the novels. It is evident that Mr. Trollope possesses a fund of humor on which he has drawn but sparingly in his fiction. He introduces a few anecdotes with telling effect, and one can readily understand his popularity in society and as a diner-out. But perhaps the great attraction of the book is its utter frankness. It is a manly, unaffected, bluff, English sort of frankness. It gives the reader the impression that he has made the acquaintance of an honest, loyal, amiable gentleman, who on his way through the world did his work faithfully and energetically, and took as much pleasure in life as he could rightfully contrive to secure. This frankness becomes a source of amusement when the author speaks of his books, which he often praises and occasionally finds fault with, in the most unreserved manner, and with all a parent's fondness for the offspring of his brain. With the usual perversity of authors, he thinks most of the books which the public has neglected and holds in comparative disesteem, the most meritorious.

Mr. Trollope's boyhood was not a pleasant one. His family surroundings were far from commonplace, and had more resemblance to fiction than to real life. His father was that familiar character of English novelists, a reduced gentleman. A chancery barrister of good abilities, he lost his practice through an ungovernable temper and lost his money through injudicious attempts at farming. He sent his boys to Harrow and to Winchester, intending that they should go to Oxford. The oldest, Thomas Adolphus, did go there, but not Anthony. The latter left Harrow at nineteen to enter the civil service. He says that during the twelve years that he had been at school no attempt had been made to teach him anything but Latin and Greek, and very little attempt to teach those languages; and that from first to last there was nothing satisfactory in his school career except the way in which he licked a boy who had to be taken home to be cured. Mr. Trollope's mother was a voluminous authoress, who is now chiefly remembered for her celebrated book on 'The Domestic Manners of the Americans.' This, her first book, was published when she was fifty years of age, and its great success encouraged her to enter upon authorship as a profession. For more than twenty years she supported her family by her writings, which filled 114 volumes. During that time she saw four of her children and her husband carried off by consumption, and nursed them through their sickness while pursuing her literary tasks with unflagging industry.

When Anthony Trollope secured an appointment in the Post-office he had never learned the multiplication table, and had no more idea of the rule of three than of conic sections. The manner in which he was examined and admitted he afterward described in 'The Three Clerks,' in the chapter relating the admission of Charley Tudor into the Internal Navigation Office. In other respects he also resembled that wild young gentleman. During the seven years that he remained in his first position he was regarded as a worthless scapegrace who was habitually un-

punctual, always in debt, and always getting into trouble of some sort. One comical scene in 'The Three Clerks' is based on an incident that actually befell him. A young woman in the country had got it into her head that he ought to marry her, and this idea culminated in the incident referred to.

"At last the mother appeared at the Post-office. My hair almost stands on my head now as I remember the figure of the woman walking into the big room in which I sat, with six or seven other clerks, having a large basket on her arm and an immense bonnet on her head. The messenger had vainly endeavored to persuade her to remain in the ante-room. She followed the man in, and, walking up the centre of the room, addressed me in a loud voice: 'Anthony Trollope, when are you going to marry my daughter?' We have all had our worst moments, and that was one of my worst. I lived through it, however, and did not marry the young lady."

Up to his twenty-sixth year there was nothing in Mr. Trollope's life to presage a distinguished or even a useful career. By a fortunate chance, however, he received at this time an appointment as clerk to one of the Post-office surveyors in Ireland. The place was looked upon as undesirable, but proved a great boon to him. His income, which had been £90 a year in London, rose at once to £400. The bad reputation which had clung to him no longer acted as a clog upon his efforts at reform, and he had an opportunity to make a fresh start. The good use he made of his opportunity shows that if we accept the French aphorism that every one has the defects of his qualities, we can temper it with the consoling reflection that every one has the qualities of his defects. In his new position Mr. Trollope displayed great energy, and made himself very useful and popular. When he had been in Ireland three years he was married, and a year after his marriage his first novel was finished. This was 'The Macdermots of Ballycloran,' which never had much success, although he says it is a good novel. It was published on half profits, but the author received nothing for it. Nevertheless, he continued writing, and his second book, 'The Kellys and the O'Kellys,' also an Irish story, appeared in 1848, when he had reached his thirty-fourth year. This was published on the same terms as the other, and with the same pecuniary result or non-result. A friend of Mr. Trollope had obtained a half promise from an influential quarter that the book should be noticed in the *Times*, and noticed it actually was, as follows:

"Of 'The Kellys and the O'Kellys' we may say what the master said to his footman when the man complained of the constant supply of legs of mutton on the kitchen table: 'Well, John, legs of mutton are good substantial food'; and we may also say what John replied: 'Substantial, sir; yes, they are substantial, but a little coarse.'"

Without waiting to ascertain the success of his second book, Mr. Trollope had gone to work on his third, 'La Vendée,' an historical novel, for which he received £20. This amount, small as it was, he admits was not earned, but only "talked out of" the publisher by the earnestness of his brother; and he records his surprise at "the ease with which publishers can occasionally be persuaded to throw away small sums of money." Earned or not earned, however, this £20 was all he ever gained by his literary work up to his forty-first year, when 'The Warden' was published, and when he had been writing books and articles for twelve years. The amount of official work he did, and by which he made his living, would have worn out a less able-bodied man. As he had a passion for fox-hunting and kept three horses, the only way he could make both ends meet was by riding on an average forty miles a day, for which the Post-office paid him sixpence a mile. It was his business to go about the country and find out whether the rural delivery of letters was satisfactory and prompt. For neither in England, nor in France, nor in Germany is the free delivery of letters confined to cities, as is our American custom.

The real start of Mr. Trollope's literary success was made with 'The Warden,' published in 1855. The remarkable thing about this book is, that although conceived in the realistic spirit which is the distinguishing trait of all that Mr. Trollope has written since, its characters were not drawn from real life, but were evolved from the depths of his own consciousness. It is a surprise to learn that this is true of the Archdeacon and of Tom Towers, of 'The *Jupiter*.' In 1857, 'Barchester Towers' was published, and was rapidly followed by 'The Three Clerks' and 'Doctor Thorne.' It is again worthy of notice that the weakest of the three is the very one which is based on actual life, being drawn in great part from the author's own early experiences, while the other two, though mainly works of pure imagination, derive their chief charm from their apparent realism. The literary reputation which Mr. Trollope had by this time acquired was out of all proportion to the small amount of pay he had received, which, however, was now beginning to rise in amount. 'The Three Clerks' he sold to Mr. Bentley for £250, and made it a practice to sell all his books for so much cash down, allowing the publishers to make all they could afterward. For 'Doctor Thorne' he received £400. Most of his readers probably look upon this as his best book, and perhaps it is for that reason that its author expresses a rather poor opinion of it.

By this time Mr. Trollope had framed for himself a rigid code of laws for the regulation of his work. When one book was finished, he at once began writing another. He prepared a diary, divided into as many weeks as he had set apart in his mind for the completion of the work. In this diary he entered each day the amount of work done, which had to average 40 pages a week, and ranged, according to circumstances, from 20 to 112 pages a week, each page containing 250 words by actual count. When he made a bargain with a publisher, he determined in his own mind how many words the book should contain. He prides himself on never having "put a book out of hand short of the number by a single word," and also "that the excess has been very small." His writing has been done in railway carriages, on steamers, at his desk at half-past 5 in the morning; and he had at last so trained himself that every day he wrote for three hours, writing 250 words every fifteen minutes as regularly as his watch went. The three hours were not actually devoted to writing; a half-hour being consumed in reading what was written the day before, so as to produce a proper continuity of tone.

In 1860 Mr. Trollope's reputation was so firmly established that he was invited to furnish a novel for the *Cornhill Magazine*, which was then about to be established, with Thackeray as editor. The first number was to come out on December 31, and, two months before, Mr. Trollope was informed that the first portion of his novel must be ready by December 12. Although the notice was short, his system of industry enabled him to respond in due time with the opening chapters of 'Framley Parsonage,' which undoubtedly added much to his fame, as it also laid the foundation of his fortune. And, strange as it may seem, it was only at this time, in his forty-sixth year, that he first became personally acquainted with the literary world of London. Henceforth his progress was rapid. He was now regularly in the receipt of from £3,000 to £3,500 for each of his longer books. At the close of his Autobiography he gives a list of all his works and of the sums received for them. The total is about £70,000, earned in about twenty-three years, and would probably have been much more if he had retained his copyrights. He thinks he has written more than any other living English author. He has undoubtedly given much innocent amusement to tens of thousands of readers who were greatly in need of it, and he has secured a respectable position in the rich English literature of our century.

ALLEN'S CHRISTIAN HISTORY.

Christian History in its Three Great Periods. First Period: Early Christianity: Second Period: The Middle Age; Third Period: Modern Phases. By J. H. Allen. Boston: Roberts Bros. 1883. 3 vols. 12mo.

THE mediæval theocracy of Rome is an historical fact, anomalous and unprecedented. So absolute an authority over the temporal and spiritual welfare of nations has existed nowhere else in the development of social institutions. It arose from the humblest beginnings, and grew imperceptibly amid surroundings that appear, externally at least, most unfavorable to its progress. The age of its culmination was one in which the moral forces seem, to modern eyes, utterly unfitted to cope with the fierce turmoil of brute strength. It offers thus an historical enigma, the solution of which is a task most attractive to the earnest student, and it is no wonder that the quest is undertaken again and again.

The primary fact which appears on the surface is this: Other religions have taught as earnestly as Christianity the terrors of the hereafter for the sinner and the final bliss of the righteous. The eschatologies of Egypt, Iran, India, Islam are as rich as, or perhaps richer than, that of Christendom, but they all place the future fate of the individual in his own hands, and he finds in the world to come the simple retribution or reward of his earthly career. Christianity alone dared not only to make its sacred class mediators between man and God, but to clothe them with such portion of the divine power that they controlled the destiny of every believing soul, which through their ministrations might hope for Paradise, or under their malediction be plunged into the endless night of torment. During the ages in which the hopes and fears of the future were realized by the average man with a vividness difficult to understand in our more critical and sceptical generation, a power such as this was transmutable into almost every other power.

It is easy thus to recognize the forces at work, but the process through which they resulted in papal absolutism is not so easy to follow. This process was not regular, but intermittent. At times it was arrested, or even forced to retrograde; at times it is lost to view in the tumultuous clash of opposing elements. Much of the material for tracing it has not come down to us, and what has reached us has passed through the hands of those who were interested, consciously or unconsciously, in suppressing or modifying all evidence that threw light on the real origin of privileges for which a divine origin was claimed. The process, therefore, can only be worked out by a patient examination of trivial incidents, each of itself unworthy a place in the pages of the historian. Yet it is thus alone that we can recognize the tendencies resulting in the revolutions which appear so conspicuously in European annals, and which, considered as isolated events, appear so causeless and so unnatural.

Without specifically undertaking the elucidation of this marvellous problem, Mr. Allen's book is unavoidably, in great part, devoted to

it; for no one can treat of "Christian history" without attempting to depict this, its most portentous feature. His treatment of it, however, is manifestly inadequate, and based upon insufficient research. He fails to grasp the fundamental fact that, in the anarchy consequent upon the breaking up of the Carolingian system, the Church succeeded in emancipating itself from the subjection in which it had always previously been held by the state, and thus obtained the vantage-ground from which it was enabled to use so successfully its spiritual artillery in its contest with its rival, Feudalism. In this period, the turning point in the history of modern civilization, Mr. Allen is conspicuously at fault. The Forged Decretals, which were the instrument whereby the Church overcame the state, he regards as merely a "counter-assertion on the part of the Church, seriously alarmed at the encroachment of the state on its spiritual domain" (ii., 17)—which is simply a confession of entire misapprehension of the whole previous course of Church history since the conversion of Constantine. Indeed, it was inevitable then, and for nearly a thousand years afterward, that the Church should be subjected to the state, or the state to the Church. Not the least important contribution of America to sociology is that happy adjustment of relations which, for the first time, renders possible Cavour's favorite formula of "libera chiesa in libero stato," which was manifestly impracticable in mediæval monarchies, where the sole religion was Latin Christianity, with its claims to regulate the whole life of man, temporal and spiritual, here and hereafter. Mr. Allen's account of the Isidorian forgeries, moreover, is wholly incomplete. No allusion is made to their precursor, the Canons of Ingilram, a comparison with which is indispensable to render intelligible their composition and reception. There is no mention of Riculfus of Mentz, their distributor and probable compiler, nor of Benedict the Levite, who so skilfully interwove them with the Capitularies. Nor is it easy to understand the assertion (ii., 16) that "it is some three hundred years since there has been any question or pretence as to their genuineness." It is true that Wicklif suspected their spuriousness, but it was not until the seventeenth century was well advanced that David Blondel vindicated his heretical views with respect to them against the earnest defence of Torrea, Malvasia, Cardinal Aguirre, and others; and even toward the close of the century the boldest of the series of forgeries, the Donation of Constantine, was still referred to as genuine by the learned Christian Wolff.

There is also some lack of accurate and definite knowledge in Mr. Allen's account of the origin of the Reformation — the other great event in Christian history. It should, indeed, be evident *à priori* that only a deep and widespread dissatisfaction among the people, as well as among their rulers, could have led so large a portion of Christendom to throw off the hereditary veneration which had become an integral part of daily life. When, therefore, our author says of the Church of the Reformation period (iii., 5), "its iniquities and oppressions were to most men a far-away and uncertain rumor," he utters a paradox from which he would have been preserved by a more intimate acquaintance with the interior life of the ecclesiastical body and its relations with the laity—the tithes which bore severely upon every peasant, the grinding taxes caused by the annates, the enormous sums raised by the sale of indulgences, the constant torment caused by the ecclesiastical courts in the rapacious chase after fees, the countless wrongs for which redress was barred by the immunity of the clergy, the hearty dislike and contempt provoked by the universal licentiousness of the clerical class. That the "iniquities and oppressions" of the Church were deeply felt by the lower strata of society is, in fact, sufficiently manifested by the thousands who, for two centuries, had gathered around any one bold enough to denounce them—Dolcino, Wicklif, Huss, Conrad Schmidt, Hans of Niklaushausen, Savonarola, and other precursors of the Reformation.

The fact is, that Mr. Allen has attempted the impossible. In the compass of three small volumes, in large type, he endeavors to convey a view of "Christian history" from the birth of Christ to the present time—that is, the history of the Church in its infinite relations with the development of society and the progress of civilization. The task is one to tax the resources of the most accomplished scholar, and to require a space many times greater than the author has assigned to it. Within this space it could only be a bald epitome of facts or a series of more or less connected fragments, and the latter is what the author has produced. It is only just to add that Mr. Allen's sympathies are always on the right side, while he is liberal almost to a fault toward the other side. The book is thus pervaded with a wholesome spirit, and, while its statements are not always to be depended on, its general influence on its readers cannot fail to be beneficial.

CHILDREN'S BOOKS.—II.

Mr. Charles Nordhoff's neglect of his early production, 'Man-of-War Life: a Boy's Experience in the U. S. Navy' (Dodd, Mead & Co. will be resented by every youthful reader of this graphic picture of a bygone time. The book appeared first in 1855, when it was still true enough to the life, though the events recorded occurred some ten years earlier. It is now history, and at every succeeding decade its value will be found to have increased instead of diminished. Mr. Nordhoff had so far forgotten his bantling that it was a surprise to him when the publishers told him it was still alive, and offered to print it anew if he would select a few pictures for it. In complying, he did the best he could within the range allowed him, but the book was worthy of special engravings, of a higher grade. For the rest, Mr. Nordhoff has left the text untouched—rightly so, for the most part. But some slight revisions in style might have been expected, and a foot-note here and there would have served a useful purpose. The comparison between the Chinese and the Japanese, for example, so greatly to the disadvantage of the former, was manifestly based on very different opportunities of seeing and judging *like classes* of the two nations. In these days of anti-Chinese prejudice and hatred, would it not have been wholesome to correct youthful opinions, hastily formed by observations from a ship's deck, by the writer's mature knowledge of the people here unqualifiedly condemned? Considering, too, that this little work is an interesting fragment of autobiography, should we not have forgiven a comment on the vow never to return to California—"which *I* have kept," as we read on page 296? But enough of criticism where the main execution has a classic excellence. The book is a good antidote for an unreasoning desire to go to sea before the mast. At the same time it will gratify harmless curiosity about life afloat, describing technical matters with great clearness. It may be read with any juvenile history of the Mexican war, or of the American navy. Some glimpses are given of the shocking brutalities once legally practised on our men-of-war. Steam and the abolition of the cat have done much to improve the seaman's condition, which nevertheless still saddens and perplexes the philanthropist.

Mr. A. G. Riddle's 'Hart and his Bear' (Washington: W. H. Morrison) is a story of life in the Ohio woods sixty or seventy years ago. On first opening the book, the rough style, the sometimes abominable syntax, the vexatious interruptions to the narrative proceeding from an imaginary circle of listeners, combine to make it seem unreadable; but further examination discloses enough of interest to cause one to forget in a measure the faulty diction. The descriptions of sounds and sights in the forest are graphic, and show a genuine love of nature, with considerable poetic feeling. Accounts of hunting and trapping are numerous and in full detail. As the author alleges personal acquaintance with the place and period which he describes, his accounts of plants and animals, as well as of the life of the people, should be correct. The story awakens sympathy. Portions of it are exceedingly sad—perhaps more so than one would wish a very susceptible child to read. At any rate, the book is not adapted to any one under twelve years of age. Almost all that is said of theology and kindred matters should have been omitted, and it is easy to see how out of place in a book written for children are such things as presentiments and super-intense dreams.

The marked success of Mr. James Baldwin's 'Story of Siegfried' last year prepared us for equally good work in his 'Story of Roland' (Scribners), and we have not been disappointed. The hero, to be sure, is not always in the foreground, and, such as the legends and the poets have represented him, would not have filled out the scheme of this plump book of 400 pages. So beside him figure his brother warriors, with his king and uncle, and the book might nearly as well have been called 'Charlemagne and his Knights.' Mr. Baldwin has culled from a wide range of epics, French, Italian, and German, and has once more proved his aptitude as a story-teller for the young, while conveying information for which many of their elders will be thankful. As in the previous work, notes, grouped as an appendix, elucidate the narrative and point to its sources—among which the 'Chanson de Roland' plays an altogether subordinate part, in the final chapter. Had Mr. Baldwin been familiar with Mrs. Follen's version of Uhland's poem of the boy Roland, he might have preferred it to the prose paraphrase which supplies so much of the interest of the first chapter; and he would, we think, at least have given it in the notes. The print is large and the illustrations fairly good.

Mr. Richard Markham, with his 'Chronicle of the Cid' (Dodd, Mead & Co.), had an easier task. He has borrowed freely from Southey, interspersing metrical fragments from Frere and Ormsby and Lockhart, and adding notes in an appendix. The result will not, we apprehend, appeal to the youthful imagination as forcibly or as pleasantly as the story of Roland; but this is not the compiler's fault. The print of this volume is bold and handsome; the illustrations are inartistic.

One of the pleasant stories which *St. Nicholas* so constantly offers its readers has been Mr. W. O. Stoddard's 'Among the Lakes' (Scribners). It is a narrative of life at a delightful country home, where city cousins and country cousins are reunited during the summer. It is quiet and healthful in tone, and full of mirth and cheerfulness. Piney Hunter, the country boy, is a remarkably fine fellow. Bi, the city youth, has also points of excellence, though he does not especially rouse our admiration. Any boy or girl, from eight to fourteen, ought to enjoy the book thoroughly.

Mr. J. T. Trowbridge's 'Phil and his Friends' (Boston: Lee & Shepard) first appeared as a serial in the *Youth's Companion*. In tone and style we find it inferior to 'Among the Lakes.' The account of Phil's troubles and of his struggles out of them is decidedly interesting, but the book has the fault, so common in stories in which a boy is the hero, of putting him too much on a level with men: the real boy element is hardly visible. The liking of Sallie Bass for the boy of fifteen is made hopelessly vulgar by her jealousy, especially when we find that she has schemed to marry him. This is absurd and repulsive. Why cannot this element be omitted from children's books?

Readers of *Harper's Young People* have already enjoyed the entertaining adventures of the plucky boys who figure in Mr. W. L. Alden's 'Cruise of the Canoe Club' Cautious parents, however, will think twice before allowing their sons (that is, without a competent guide) to make real the doings which are so charming on paper. Surely the risks to their own lives and to other people's property which it is permissible to let young people take, should have some limit.

The first play in 'Alice thro' the Looking-Glass, and Other Fairy Plays,' by Kate Freiligrath-Kroeker (G.P. Putnam's Sons) is, of course, a dramatization of Lewis Carroll's amusing story, and cannot help being full of superfine, double-distilled nonsense, which will make children very gleeful to act, or see acted. The other three plays are all sprightly, though much less novel in their characteristics. In accordance with fairy-lore, they all culminate in matrimony, to which we need not repeat our objection. One of the plays is entitled, "Servantgal-ism in Fairyland," and contains some common sense for mothers as well as fun for children; but here again "servantgalism," and the ideas connected with it, are hardly fit food for infants. On the whole, while the acting of any of these plays would give much amusement, children's brains, one would think, might be put to better use than in learning them.

Sophie May has a very happy touch in picturing scenes from child-life. One feels like picking up and kissing the children she describes. Moreover, she contrives admirably to teach while entertaining, and many a little girl will read 'Flaxie's Kittyleen' (Lee & Shepard) with both profit and pleasure.

'From Do-Nothing Hall to Happy-Day House' (E. & J. B. Young & Co.) is a pretty little volume, very fully illustrated with dainty colored pictures, which are, however, somewhat monotonous. The story is a hodge-podge of allegory and reality, and aims to show how much better Do-as-you're-told is than Do-as-you-like, plain food than jam, etc. But its success is very doubtful. The solemn words at the end seem very incongruous.

Quite by itself amid works pertaining to child-life which the present season has produced, is Adrien Marie's 'Une Journée d'Enfant' (J. W. Bouton). An English preface tells us who the artist of this charming series of twenty designs is, but he speaks for himself with his pencil, and whether he has been six years married or ten, and has two children or five, we know him at once as a lover of the little ones and as a very clever and graceful draughtsman. The plates are everything, for there is no text. The table of contents gives the title of each—"Le Reveil," "Bonjour, Maman," "Le Lever," . . . "A table," "Le Coucher," "Bonsoir, Bébé." Over against the page number are set hieroglyphics appropriate to the story of the hour, and these are repeated on the title-page preceding each plate. They are as admirable in their way as the larger (folio) drawings, which are printed in heliogravure in varying brown and blue tints. In all, the spirit of the nursery is perfectly caught, and it would be hard to single out any for special excellence. The child's day is followed from beginning to end, and it is mostly a happy and altogether a well bred day. The book is beautifully made—too much so for childish handling, but not for a token of parental love or of friendly interest in a little girl not one's own.

The Middle Kingdom: a Survey of the Chinese Empire and its Inhabitants. By S. Wells Williams, LL.D. Charles Scribner's Sons. 2 vols. 8vo, pp. 1611.

Both the book and the personal career of the venerable author of the work before us illustrate the prophecy of the Wise Man in Proverbs: "Seest thou a man diligent in his business? He shall stand before kings; he shall not stand before mean men." Graduated from the Rensselaer Polytechnic Institute at Troy in 1822, at the age of twenty, Mr. Williams went out as printer to the American mission in China the same year. Quickly mastering the rudiments of the Chinese language, and hungry for all knowledge relating to the sons of Han, he became a prolific maker of handbooks and dictionaries. These practical works are still in use. Visiting the United States in 1845, his lectures upon China expanded into 'The Middle Kingdom,' an octavo work in two volumes, which became the standard work on China. Yet, despite the fulness and accuracy of the matter in the old edition (the third, in 1857), the baldness of the style repelled many readers. One good test of the literary value of works of this class is, that persons having no special interest in the subject will begin and finish the matter for the form's sake. We doubt whether many people read the old work except from a sense of duty, or from interest in the country and people of China. A good appetite is the best sauce in mental as in physical diet. The general reader has now before him a vast improvement in both the abundance and quality of the viands and the literary cookery of the caterer. To our own mind, this is really the leading merit of the new edition. Its readableness is at once apparent. We confess that we found the old work prosy and dull: Whitaker's Almanac seemed the model of the writer. It has been with the zest of surprise that we have read most of the new book in Scribner's sumptuous edition. Some future devotees of the "higher criticism" may yet declare the two books of the same name to have been composed by different authors. In one point the verdict that a redactor had touched up the original author's work would certainly be well grounded in fact, since the last three chapters have been revised by Frederick Wells Williams, a son of the author.

Of the forty-three years of Doctor Williams's life spent in China, the first half was passed in faith of better things to come, and the latter half in sight and enjoyment. Beginning his career in Canton, he was heralded as a "foreign devil," under the tutelage of a hong merchant. His time to stand before kings did not fully come until 1874. In that year the long-disputed "audience question" was settled. Then the Japanese ambassador, Soyéshima, stood erect before the unveiled face of the Chinese Emperor, instead of making the kotow, or "nine prostrations." As Secretary to the United States Minister, B. P. Avery, our author looked upon the face of the Emperor Tungchi, standing in audience before him. Having seen many and mighty changes, and, better still, a goodly number of steps of progress, Doctor Williams is assured of a great future for the sons of Han. "But the progress of pure Christianity," he believes, "will be the only adequate means to save the conflicting elements involved in such a growth from destroying each other."

Examining in detail the present edition of 'The Middle Kingdom,' we find the first volume the less changed of the two, though much larger and handsomer than its predecessor. The first four chapters, geographical in their character, are modernized and enlarged. Chapter v., on "Population and Statistics"—on which the author spent more time, labor, and logic than on any other in the old book—is substantially the same, only kept abreast of the latest researches. Chapter vi., on the "Natural History of China," has been rewritten throughout, and would bear reprinting as a text-book. Little change is noticed in the remarks on the laws, government, and administration, but the four chapters on the "Language, Literature, and Examinations" are greatly amplified, and show the facile sweep of a ripe scholar. In every branch of learning, notwithstanding Doctor Williams's personal familiarity (from actual experience and mastery) with each, generous reference is made to the multifarious literature of both natives and foreigners in many tongues.

In vol. ii., after passing the slightly altered portions on "Industrial Arts and Science among the Chinese," we find that, in treating of the "History and Chronology," the author, while not ignoring the labors of other scholars, takes conservative ground. He nowhere refers to the researches of Terrien de la Couperie and the results of Assyrian studies. He longs, however, for some Gibbon or Niebuhr to explore the inviting field of early Chinese history, and give us what is now lacking—a good history of China. A hearty believer in Christian missionary work, he devotes nearly a hundred pages to this subject, which we commend for its candor and accuracy to "hard-headed business men," as well as to Sunday-school teachers. The last five chapters describe the history of "Foreign Intercourse with China"—the wars with England, the change in China's foreign policy, and the Tai-ping rebellion. The forty-nine pages here descriptive of this fungous growth of foreign ideas give the pith of what is known concerning the Tai-pings. In the narration of events which, during the last half century, have forced the once sleepy and lazy Empire into something like her proper position before the world, Doctor Williams's chapters have all the warmth of local coloring natural to an eye-witness, and all the sustained enthusiasm of one who believes that this "cycle of Cathay" (which, by the way, Mr. Tennyson, is only sixty years) is as good as "fifty years of Europe."

In conclusion, this representative American and Nestor among our sinologues expresses his faith in the future welfare and progress of the great Empire:

"The chiefest fear must be that of going too fast in schemes of reform and correction, and demolishing the fabric before its elements are ready for reconstruction. The non-existence of caste; the weakness of the priesthood, which cannot nerve its persecuting arm with the power of the state; the scanty influence religion has over the popular mind; the simplicity of ancestral worship, the absence of the allurements of gorgeous temples, splendid ritual, seductive music, gay processions, and, above all, sanctified licentiousness to uphold and render it enticing to depraved human nature; the popular origin of all Government holidays; and, lastly, the degree of industry and loyalty and respect for life and property—these are characteristics which furnish some grounds for trusting that the regenerarion of China will be accomplished, like the operation of leaven in meal, without shattering the vessel."

For the work, as a piece of book-making, both author and publisher deserve praise. It has

large type, clean pages, and good margins; first-rate binding, abundance of bibliographical reference, copious and well-chosen illustrations, a good index (thirty-three pages), and the best map of China at present possible folded in the cover.

The Story of Nell Gwyn; and the Sayings of Charles the Second. Related and collected by Peter Cunningham, F.S.A. With a complete index to the personages mentioned, now first published. John Wiley's Sons. 1883.

THIS story is the fruit of careful and extensive antiquarian research, not only among printed books, but in manuscripts, scholars' annotations, and letters. When one considers the obscurity of many of the persons involved and the triviality of most of the incidents, it seems a wonderfully complete account of the character and career of the most popular mistress of any English King, unless the half-mythical fair Rosamond be excepted. The author follows her life circumstantially, from her hawking of oranges in the Restoration theatres to the time when she ended her days in grief for her generous master, the King, and Otway, the poor poet. He shows her to us through John Evelyn's proper and Pepys's naughty eyes, describes her on the boards in her favorite comic parts of Dryden's new plays, relates her amours with Charles Hart, the actor, and Charles Buckhurst, the genuine nobleman, before she charmed by wit and beauty her "Charles the Third," as she called him. Her frolics, her repartees, her houses and furnishings, her deeds of public and private charity—Mr. Cunningham omits nothing; and throughout his difficult task he exhibits, in addition to the accuracy and completeness of the antiquary, the taste of the gentleman. Perhaps he apologizes too much for his heroine; he is apt to indulge in exculpatory comparisons of her with others who, in the phrase of the time, "were in the same state of preferment," from Jane Shore to Mrs. Robinson. In forgiving her fault the strictest precisian would find himself, for once, in good company: Archbishop Tenison preached her funeral sermon, Queen Mary praised her, and many a veteran soldier in Chelsea Hospital must have blessed her memory, since tradition has ascribed its foundation to her influence. Pretty and witty they called her in her life; but in that corrupt court there was no more honest and loyal heart than hers, too near the throne to listen to the whispers of Monmouth and Cavendish, too near the people not to teach the King how to give as well as to spend. Her story is the first romance of our stage; it is still full of human interest, and is besides a picture of life and manners. This account of it ranks as history, and well deserves the honor of a second edition which it here receives. It is beautifully printed, contains a fine portrait, and is supplemented by valuable appendices on the De Grammont Memoirs and their author's family. One chapter in the body of the volume is an independent collection of Charles II.'s witty remarks.

Hand-book of Mexico. Information regarding the Republic of Mexico at the present day. Compiled by J. M. Robertson. Thompson & Moreau. 1883.

THIS book bears marks of having been hurried through the press to catch the market. It is printed with extreme inaccuracy, scarcely a page being faultless. So many of the mistakes are found in the Spanish of the work that one would be tempted to excuse them on the score of ignorance of that language, were it not true that even more appear in the English. The value of such a book is in proportion to its accuracy and its fulness. In general, Mr. Robertson's statements are correct, but he falls into some errors. Señor Vallarta is no longer Vice-President of the Republic and President of the Supreme Court (pp. 10, 12), having resigned last year. Congress has two sessions each year, not, as stated (p. 12), only one. The President and Vice-President are not elected by Congress (p. 12), but by the Electoral College. Congressional districts are to contain 40,000 inhabitants, not, as said (p. 11), 80,000. The whole matter of the Electoral College is sadly muddled under Mr. Robertson's treatment. A thrifty maguey plant produces far more than the 125 quarts to which our author would confine it (p. 28). The export duty on coined silver (p. 118) has been repealed.

In point of completeness the book leaves much to be desired. The "current papers of the day" are not exactly the sources a writer should, almost exclusively, consult in order to make a "hand-book." Under "Agricultural Products" we have articles on the maguey, on cotton, on rice, but are told nothing of corn, the great staple of the country, nothing of tobacco, nothing of coffee. We learn nothing of Mexico's exports, nothing, or next to nothing, of her infant manufactures. Much of the information given is valuable, but it is, after all, of a newspaper, fragmentary sort. If Mr. Robertson had taken pains to read the Governmental reports, or even such popular works as the 'Nueva Guia de Mexico' and the 'Anuario Universal,' both issuing new editions every year, the former in English, French, and Spanish, he might have had a better right to entitle his book as he did.

BOOKS OF THE WEEK.

Aldrich, T. B. Mercedes, and Later Lyrics. Boston: Houghton, Mifflin & Co. $1 25.
Alger, W. R. The Poetry of the Orient. Boston: Roberts Bros. $1 50.
Allen, Rev. J. H. Christian History in its Three Great Periods. Third Period. Modern Phases. Boston: Roberts Bros. $1 25.
Arnold, E. Indian Idylls. From the Sanskrit of the Mahâbhârata. Boston: Roberts Bros. $1.
Baker, G. E. The Diplomatic History of the War for the Union; being the First Volume of the Works of Wm. H. Seward. Boston: Houghton, Mifflin & Co. $3.
Besant, W. All in a Garden Fair: the Simple Story of Three Boys and a Girl. Harper's Franklin Square Library. 20 cents.
Betts, J. T. Juán de Valdés's Commentary on the First Epistle to the Corinthians. Also, the Lives of the Twin Brothers, Juán and Alfonso de Valdés, by Edward Boehmer. Trübner & Co.
Bradburn, Frances H. Memorial of George Bradburn. Boston: Cupples, Upham & Co.
Brown, H. C. Handbook of Dates. Arranged Alphabetically and Chronologically. A. Lovell & Co.
Buckham, Dr. T. S. Insanity, considered in its Medico-Legal Relations. Philadelphia: J. B. Lippincott & Co.
Burnett, Frances Hodgson. Vagabondia: a Love-Story. Boston: J. R. Osgood & Co. $1 50.
Butler, Dr. S. W. The Physician's Daily Pocket Record. 18th year. Philadelphia: *Medical and Surgical Reporter* office.

Nohl, L. Life of Wagner. Chicago: Jansen, McClurg & Co. $1 25.
Nordhoff, C. Man-of-War Life: a Boy's Experience in the United States Navy. Illustrated. Dodd, Mead & Co. $1 50.
Optic, Oliver. Snug Harbor; or, The Champlain Mechanics. Boston: Lee & Shepard. $1 25.
Outlines of Sermons to Children. With numerous Anecdotes. A. C. Armstrong & Son. $1 50.
Phelps, Elizabeth Stuart. Beyond the Gates. Boston: Houghton, Mifflin & Co. $1 25.
Prose Works of Matthew Arnold. 7 vols. Macmillan & Co. $10 50.
Pyle, H. The Merry Adventures of Robin Hood. Chas. Scribner's Sons.
Reed, S. B. Cottage Houses for Village and Country Homes. Illustrated. Orange Judd Co. $1 25.

Fine Arts.

THE FALL EXHIBITIONS.

AS one mounts the stairway at the National Academy of Design he is confronted by a canvas of considerable size—No. 1, "Autumn," by Miss Rosina Emmett—upon which is depicted the standing figure of a young woman, in a dark-green gown, who is reaching up to arrange a spray of autumnal woodbine upon a folding screen. At her feet, toward the left, is a mass of asters, golden-rods, and other wild flowers, and at her right a chair. As seen from the first landing of the stairway the picture produces an effect which arrests the attention, but our interest is exhausted when we find, as we quickly do, that the first impression is produced by a clever presentation of the merely obvious qualities of the various objects represented, rather than by a refined expression of what is beautiful. We do not feel that the picture is beautiful, and hence there is nothing to awaken any deep feeling or to hold the attention. The sensation excited at a glance by an apparently forceful realization of commonplace objects, however pleasing it may for the moment be, is a transient and superficial one; and if, on more prolonged examination, no substantial elements of beauty are discovered, the first pleasurable sensation is not sustained, and we quickly pass on to something else. The want of artistic capacity and taste in choice and treatment of subject are strongly marked in this work. One may reasonably ask why it was painted at all, or at least what there is in the theme to justify its being wrought on so large a scale, and why it is hung in this conspicuous position. A true artist is impelled to design from a strong sense of the beauty of some conception, or of some natural scene or object. This sense of beauty takes possession of his feelings and leads him to portray with affection all that is lovely in the forms and colors of his subject. Is there any sign of such sense of what is beautiful, or of any affectionate work, in this ambitious canvas? We can perceive none. The figure of the young woman, though not especially uncomely, is in no way fine enough to form the central object of a large picture. The pose is ungraceful, and the head is without beauty of expression or of feature. The accessories are equally without selection, and are without expression, even, of the finer characteristics of line, form, and color which may be found in such things when taken at random. The whole subject appears made up: it has not the appearance of a spontaneous conception. The style of painting is theatrical, and the kind

of appeal which the picture makes is largely akin to that of forcible scene painting. That is to say, what characterizes it is a pungent and coarse decorative effect, joined with an illusive, rather than a refined, realism. The picture is not at all exceptional in these respects, but by its size and position in the gallery it invites these remarks, which apply equally well to a great many others.

No. 2, "Hydrangea," by Ward W. Wright, has some good rendering of color values, and clever expression of the translucence of the glass vase and other such objects represented. It does this, too, in a way that seems to indicate a real enjoyment of the beauty of color. But the branch of hydrangea itself is ill chosen: its stems are without spring, its leaves lack surface modelling, and the flowers purity of hue. The landscape, No. 4, "Southampton, L. I.," by Wm. H. Lippincott, is effective, though mannered, in tone. There is a feebleness in the group of sheep to the left arising from the want of points of emphatic shade. This closely-huddled group could hardly fail to cast some more shadow on the ground; and the legs of the sheep would, we should think, tell more distinctly dark against it. There appears to be too little shade under the foreground trees also; and the perspective of the further reaches of the awkwardly rigid fence is not correctly rendered—the distances between the posts being too nearly equal. The tree forms, too, though not unnatural, are ungraceful. Not every tree that Nature presents is fit to be introduced, without modification, into a picture. The element of grace is requisite in all forms of design. Nature offers enough that is graceful, so that the artist need never portray objects that are ungainly, for lack of good models. Following the numbers in their order, we do not come to anything more upon which to offer special remark, till we reach No. 56, "Cherokee Roses," by Elizabeth Boott, which up to the point of broadest expression of color values is very good. But this is only the beginning of painting, and there is no valid justification for systematically stopping at this point, especially when, as in this case, the broad values are not based upon a correct foundation of drawing. The fine lines of branch form, the subtle beauties of growth, poise, and surface in leaf and petal, and their countless modifications of color, are no less essential elements of character in a rose than is this mere elementary color effect as presented to the dilated eye. No tedious elaboration is necessary to render these other qualities satisfactorily. Only a complete, rather than a partial, conception of the thing to start with, and reasonable patience in execution, are requisite. The faults of this work are faults of inadequacy, rather than of vice.

No. 81, "Peonies," by the same artist, is not so good in color and tone. The flowers are foul in hue, and lack form more conspicuously than do those in the former example. But it is better to stop at the point reached in No. 56 than to proceed in the manner illustrated in No. 52, which hangs next it. This last has no just foundation of color values, and its elaboration is, therefore, thrown away. No. 68, "Marigolds," by Julia Dillon, is extravagant in the use of strong colors. The brilliancy and strength of color in such flowers cannot be reached by any pigment, of course, but a nearer approach to the effect which they have upon the eye may be reached by a temperate, than by an extravagant, use of color. The effect here produced is too much that of simply loaded paint. A subject like this is almost unpaintable, and to manage it with any success at all requires exceptional skill. The drawing of the details of the straw bonnet in which this heap of marigolds rests, invites some critical remark, which is called for in many other cases where similar objects are treated. In the braiding of such an object there is always a marked order and regularity in the short portions of the strands which can be rendered only by careful drawing. These details have not equally distinct effect upon the eye in all parts of the object, of course. It may be that they will clearly appear at only one or two salient points, as in the lighted part of the hollow to the right in this study. But in so far as they are at all seen they will be seen in their orderly arrangement, and must be so represented for right effect. There is nothing more instructive, in a minor way, in Venetian painting, which displays every excellence, than the truthful thoroughness with which things of this sort are always depicted. In drawing a basket, a coil of rope, a length of chain, or any kindred thing, a Venetian master never fails to express the true arrangement of these details, though he may do it in a sketchy manner. Attention to such orderly sequence of details is, without exception, a mark of good art. After securing the proportions of the large masses, the first thing that a good artist does is to look for what order and relationship may exist between the component parts. In our present methods of art training this matter is practically ignored, and consequently it is a rare thing now to find a complicated object correctly represented, no matter how marked may be the order in which its details are arranged. An instance of the prevailing shortsightedness and incorrectness to which we are referring may be found in the figure illustrating the pine cone in Webster's Unabridged Dictionary. The beautiful spiral curve which each series of scales, in the pine cone, follows as it ascends from the base, is certainly a leading characteristic of the object; but it finds no expression in this illustration.

No. 89, "In Newport Harbor," by James B. Sword, has some strong and effective qualities, but it contains passages of conspicuously false relation, as where the brilliant green and orange-colored grass of the middle-ground contends too powerfully with similar passages in the near foreground. There is a pretty passage to the left, where the dark rock cuts against a lighted space of water, with distant hills and boats beyond. The blue shadow which falls across this space of water appears to us, however, to be a little out of harmony in the quality of its blue. No. 91, "Autumn Afternoon," the first picture on the list in the east gallery, has some cleverness, but it is too artificially picturesque. It has not enough expression of the freshness of nature, nor has it an appearance of genuine inspiration. There are many ungrammatical passages in it, as in the red-clad figure in the central boat, the brown shadow and the scarlet light of which are inconsistent with each other. This brown does not represent what the scarlet would become when modified by shade. The forms of the water, and of the beach, with its stones and piles, are not only sketchily, they are falsely, suggested. There are several *genre* pictures in this gallery, but they present very little that is especially praiseworthy. In No. 93, "After the Hunt," by James B. Sword (which represents a man feeding a group of dogs), the dogs are, apparently, singularly inanimate, and comparatively indifferent to the meat which is being offered them.

No. 95, "Embarrassment," by William T. Smedley, is a clever piece of realism. The interest of the picture attaches, however, rather to the amusing theme than to the qualities of execution, though these are not bad as far as they go. There is a monotonous sameness of color throughout the design which impairs the general effect; for example, the carpet and the girl's dress are too nearly of the same color. No. 99, "Ripe Fruit," by C. Y. Turner, has a gracefully, though somewhat artificially, draped figure. But the subject is another of those which are too evidently made up, and there is in this, also, a painful sameness of color. Even the flesh looks as though it had been painted from the same part of the palette as the gown and the background. Mr. J. G. Brown, in No. 130, "Longing for the Sea," and in No. 226, "As Good as New," in the south gallery, remains singularly stationary as regards color values, but his work is always painstaking, and, according to his own conception of things, well finished. His sympathy with the kind of subjects which he chooses to paint is entirely genuine, and hence he rarely fails to touch the sympathies of others. But for beauty of painting, as such, we do not dwell long upon Mr. Brown's work, notwithstanding that it evinces in a marked degree an earnest aspiration for technical excellence. Nos. 107, 108, 109, 116, and 117 are "ideal" and sentimental heads, with little meaning, and without beauty or even average merits. Nor can much be said in praise of Mr. F. S. Church's fanciful picture, "The King's Flamingoes," No. 126—seemingly inspired, as regards the general color scheme, by Mr. Dewing's "Prelude," of the last exhibition of the Society of American Artists.

Mr. Henry P. Smith's "Morning at Sea," No. 128, is not less impressive than his former pictures of similar subjects, for which we have expressed our admiration. Mr. George H. Smillie has a pretty and effective landscape in this gallery, entitled "Summer Meadows"; and Mr. Harry Chase a skilful, though conventional, marine picture, No. 149. No. 150, "A Village Near the Sea," by Bruce Crane, is a refreshing and strong piece of unconventional work. There is a fine expression of clear daylight in it, though in total effect it is somewhat too patchy to be altogether pleasant. It seems to be a study rather than a picture, and as such it is uncommonly good in color and light. From the excessive clearness of our atmosphere, and the unpicturesque and rigid character of our rural domestic building, it results that our landscape offers few quite satisfactory subjects to a painter. The want of gradation in this picture, and the sharp angularity of the farm buildings, are not, therefore, to be charged to the artist.

Mr. Arthur Quartley's "Waiting for High Tide," No. 173, in the south gallery, has some suggestiveness and agreeable harmony, but there is nothing conspicuously fine in the picture: it is little more than ordinary painting of boat, sail, and wave. A strong picture, with an especially fine and effective sky, is Mr. G. H. McCord's "Sunset at Biddeford, Me.," No. 181; and No. 184, "Near Annisquam, Mass.," by H. Bolton Jones, is remarkably true and fresh in broadly rendered color and tone. Mr. Jones seems to have profited by study of the French school, without having fallen into the extravagant habits which that study is apt to induce. This picture has a delightful suggestiveness. The bright summer sky, with its white clouds, the exquisitely related tones of sunlight and of shadow on banks of earth and scattered boulders, and the wide space of broken foreground, are all rendered with a masterly hand, and with admirable effect. The only discord which we feel in the picture is that which arises from the blue shadows cast by tussocks of grass on the foreground sands. These seem a degree too light for perfect tone.

In "When the Tide is Low," No. 207, by Harry Chase, the masses are well placed, and the figures are happily graduated as they retire. There is in the picture also an admirable expression of pervading light. In parts, however, the effect is rather forced, especially in the nearer objects.

Mr. Chase paints apparently with a German ideal in his mind, and this seems to influence his own impressions of things unduly. There appears to us a great deal of excellence in Mr. Leon Moran's "Eel Fishing, Twilight," No. 219, though the influence of a school ideal is strongly manifest in him also. The common materials of this picture are well composed, and the early evening light is well suggested. We should think that the near objects—the pier and the figures—ought to be a little stronger in force of shade against the lighted water. But error on the side of temperance in the use of shade is better than the now common one of overshading. Mr. J. B. Bristol's "Saco River at Fryeburg, Maine," No. 229, is an exquisite passage of landscape, with a charming reach of intervale and fine mountain forms in hazy afternoon light. A somewhat conventional treatment, which does not admit enough freshness and variety of color, impairs the beauty of the work, however. That is to say, the atmosphere which envelops the scene too far suppresses the local colors of things. This fault is common to all mannered expression of tone, all effort to secure tone otherwise than by a true relationship of local hues. It is a fault that prevails more widely than almost any other. It was conspicuous in the works of that, in many respects, fine painter, the late S. R. Gifford, and it is one into which all artists inevitably fall who work mostly in the studio without constantly renewed recourse to nature. No. 247, "Advice," by Frederick W. Freer, presents a marked instance of that other kind of false tone upon which we have frequently remarked already, viz: that which arises from inattention to the principle that under ordinary daylight the colors of objects retain their broad effect throughout all modifications of light and shade. The principle, as clearly stated by Fromentin in 'Les Maîtres d'Autrefois' (p. 342), is more important to a colorist than any other, and yet one finds it grossly violated by modern artists with singular frequency. In this picture by Mr. Freer the flesh color is one thing in the light, and a very different thing in the shadows. The shadow color is not what the flesh color would properly become when shaded. The same want of color truth exists in all other parts—the red chair, the white gown, etc. A good colorist will follow all the modifications of color, caused by light, shade, and reflections, which any object may present to the eye, but he will so manage this as to retain the essential integrity of each color as compared with other colors in its neighborhood. Mr. J. W. Champney's "Hop Scotch," No. 264, is a better piece of work than we have seen by him before. But Mr. Champney does not seize and present with emphasis the most beautiful elements of his subjects. Their superficial characteristics occupy his attention, and that of nearly all our other *genre* painters, too largely.

There is not much to justify the exhibition of such sketches and studies as those which now fill the gallery of the Society of American Artists. There is, in hardly any of these examples, an indication of effort to do more than to knock off, at one *coup*, some vague impression the elements of which seem derived partly from nature and partly from the impressionist schools. The Whistler inspiration is unmistakable, not only in the character of the work, but also in some of the titles, as a "Sketch in Gray," a "Symphony in Gray," etc. We regret to see this, for whatever value Mr. Whistler's vagaries may be thought to possess, as expressions of his own eccentric genius, they are certainly not forms of art to be imitated by others. The sketches which appear to us the most worthy of mention are No. 165, by William C. Fitler, which is a good and unaffected study; and No. 187, by W. Merritt Post, an apparently honest effort to paint what the artist saw—which is not art, but is good as far as it goes. There is some good feeling for color in No. 221, by E. H. Blashfield; and No. 232, by William H. Lippincott, is a bright color sketch. In No. 234, Mr. Henry P. Smith has caught something of the clear green of sea water; and other bits of good color and light (there is no *drawing* in the gallery) are Nos. 116, 120, 151, 142, 165, and 234. Among the most successful in harmony and general effect we may instance the following—Nos. 134, 149, 221, and 244.

Henry Holt & Co.

HAVE JUST READY IN THE

American Science Series

BRIEFER COURSE:

Packard's Zoology.

By A. S. Packard, Jr., Professor in Brown University. 12mo, $1 40.

Martin's The Human Body.

By H. Newell Martin, Professor in Johns Hopkins University. 12mo, $1 50.

Newcomb and Holden's Astronomy.

By Simon Newcomb, Professor in the U. S. Navy, and Edward S. Holden, Director of the Washington Observatory. 12mo, $1 40.

The above books have been prepared with special reference to use in Academies and High Schools, and for College Classes, which have not time or disposition to go as thoroughly into the details of these sciences as would be necessary in using the well-known larger works in THE AMERICAN SCIENCE SERIES.

☞ *Specimens sent to teachers for examination, post-paid, upon receipt of one-half the advertised prices.*

Published this day:

FELICITAS.

A ROMANCE.

From the German of FELIX DAHN.

"It is exceptionally thrilling and dramatic."—*Blackwood's Magazine.*

In 1 vol. Price, paper cover, 50 cts.; cloth binding, 90 c.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 15, 1883.

The Week.

GENEAL BUTLER denies that he has been "killed off," and explains his exact predicament in a characteristic manner. He says that he was defeated by the "freest use of money, fraud, and corruption," that Massachusetts is a Democratic State with him as a candidate, and that, with a "judicious platform and a popular nomination" next year, "we should at least keep all the Republican men and money at home to take care of Butler, instead of sending both into Ohio and Indiana to corrupt those States." There is no telling what headway he may make with that ingenious programme during the next six months, but at present all the indications are against him. The Democratic journals with one voice pronounce him out of the Presidential race, and are manifestly so glad to be rid of him that they will oppose all efforts on his part to get on his feet again. Still, the situation is undoubtedly a serious one for the Massachusetts people. They will probably feel, as long as Butler lives, very like a respectable family that has a disorderly house next door, which it cannot get rid of, owing to the connivance of the police. But it is a situation which has been long impending. The increasing mediocrity and colorlessness of the Republican politicians of the State for many years back have been for some time, as the indefatigable "G. B." intimates in another column, foreshadowing some such crisis as the Butler candidacy. The decent people of the State must contrive some mode of getting themselves led by men of heavier metal than they now have, or they will assuredly be led into captivity by the Democratic Nebuchadnezzar.

The Virginia Bourbons make it known through their leading organ that they will not attempt to repeal any of the repudiation acts of the Mahone Readjuster government, but will treat them as settled beyond recall. Some surprise is expressed by Republican journals at this announcement, but we cannot see why. The Bourbons took this position in their last State Convention, and made their campaign upon it. They were forced into it by Mahone's success, and their surrender marked the complete subjection of the State to his demoralizing influence. Before his appearance as a leader there was little repudiation sentiment in the State, and the chances are that if he had never appeared the State would have paid its debts. The Bourbons saw that their only way of getting back into power was to cease to oppose Mahone as a Readjuster and fight him simply as a Republican, and so they threw principle aside and went in for success. Before Mahone's advent the Virginia Democrats were Bourbons with a high sense of State honor. Now they are simply Bourbons. This is the sum total of Mahone's work.

The elections have had the usual effect upon the friends of Mr. Blaine. A beautiful letter has been published in one of his favorite newspapers, giving a description of the retired statesman as he appears in his Maine home. He is still writing history at the rate of four hours every day, has "put aside the mantle and temper of a partisan," has "found instead the calm, judicial quality of a commentator," and looks "back over the politics of the past twenty years as a sort of Vanity Fair" of which he was a part. He has not the slightest longing to return to political life, preferring the quiet seclusion of his "unpretentious frame house," in which there is "no display of wealth or accumulated honors." His elegant and expensive mansion in Washington, it should be remarked here, has been let till after the next campaign.

Several Stalwart leaders are credited with saying that the result of the New York election has greatly improved President Arthur's prospects for a renomination, and Governor Foster, of Ohio, seems to have a similar view. It is almost incredible that anybody who has watched the political currents in this State for the past few years could so completely misunderstand their meaning. Only a year ago Mr. Folger, a personally unexceptionable candidate, was defeated by 192,000 majority, simply because he was the Administration candidate, and was forced upon the party by methods which have been made odious in this State by the President's personal following. The change in the vote last week did not in any sense represent a change in sentiment on this point. It was the total absence of the Administration as an issue which brought the independent Republican vote back again for the party ticket. The only State in which there was a distinct Administration issue on Tuesday week was Virginia, and while the result there has undoubtedly relieved the Administration of a burden, it can scarcely be said to have added to the President's popular strength. It is perfectly apparent that the Republican candidate who will be most likely to win next year will be the one who can command the support of the independent voters not only in New York, but in other parts of the country. There has never been any evidence that President Arthur would be that kind of a candidate.

A canvass of the members of the new Legislature in Iowa, which has been made by the Chicago *Tribune*, shows unmistakably that there is little prospect for extreme prohibitory legislation this year. There is an undoubted majority against submitting again to the people the sweeping Constitutional amendment prohibiting both the manufacture and sale of liquor throughout the State. The most the prohibition advocates can hope for is a statutory enactment to the same effect, which would remain in force only until modified or repealed by a subsequent Legislature, and even this is doubtful. It is very evident that a reaction has begun in the State from the prohibition fanaticism which has carried everything before it in the past few elections, and that the majority of the people are now in favor of less radical temperance legislation. In fact, as we pointed out a few weeks ago, the Prohibitionists in Ohio as well as Iowa, have made no substantial advance by their recent crusades. They have given the political parties much trouble, but that is about all. In the Ohio Legislature there is not only an anti-prohibition majority, but an anti-temperance majority, which will remain in power for the next two years, for in Ohio, as in Iowa, the Legislature is chosen biennially. So far as legislation is concerned, therefore, the prohibition movement is practically arrested till 1885.

General Sherman, in his recent addresses, has been trying to cheer the army up by promising that, though the Indians are gone, "a bright future" still awaits the soldiers, for, he gives them to understand, there will always be fighting of some kind to be done; if there are no foreign wars, there will be civil dissensions, such as those between labor and capital, in which the army can always take a hand. We doubt much whether the future of the American soldier can, in the old military sense, be called "bright." Now that we have the continent practically to ourselves there is hardly any chance of a great foreign war. No nation on earth would dream of coming here to fight us, and it would require a very pressing invitation indeed to get an American army to go to Europe, even for a short summer war. In a military sense, too, the labor-and-capital fighting cannot be called attractive. When labor goes to war, it usually confines itself to riots; and the suppression of riots is not an agreeable or exciting military duty, though one in which the soldier is often most useful, and indeed necessary. Indeed, we are inclined to think that the American standing army will have to have its duties in some way modified or rearranged, so as to make life in it tolerable, with war so very remote a contingency. It will have to be converted into something like Mr. Ruskin's St. George's Society, which men will enter who long for non-paying labor and the asceticism of discipline.

We trust that Congress will do something this winter to remedy the absurd condition of the law on the subject of letters held for postage. The way the Post-office deals with these now is very wasteful and very inconvenient. A resident of New York, for instance, who has been off to the Adirondacks, or the Maine lakes, or Europe, finds on his return a notice that a letter is held for non-payment of two cents at the Post-office station nearest his house, and that he can have it on applying at the station with a stamp. The next day he goes to the station, and on presenting his stamp is told that letters of this description are only held there for a week, and that they are then sent to the General Post-office. Hurrying off to the General Post-office, he is there informed that the letter has been forwarded to the Dead Letter Office at Washington. Feeling sure that he must at last be on the right track, he writes to Washington for it, and receives

an answer informing him that the letter has been "opened, found to contain no valuable enclosure, and then destroyed." He has, therefore, spent a good deal of valuable time, and the Post-office has sent him two circulars through the mail, which at the lowest estimate must be worth two cents in time and clerical labor, the net result being the destruction of the letter, with the assurance from the Third Assistant Postmaster-General that it contained nothing of value. On this point he may fairly say that he prefers to judge for himself. The whole process is worthy of a European circumlocution office of the last century.

The decision of the Pennsylvania Supreme Court that the Pullman Car Company is liable for negligence which results in the robbery of passengers, is very satisfactory. The object of taking passage in such cars, the Court very justly says, is to enable the traveller to sleep. Travellers who like to sit up all night and defend themselves against thieves with bull-dog pistols, are of course at liberty to do so; but the very fact that the condition of sleep renders a man helpless makes it necessary that a company which invites a man to slumber should not make its "sleeping facilities" also thieving facilities. The Romans had a legal maxim that the law helps only the wide-awake, on which the company in this case perhaps relied. But the Romans had no Pullman palace cars. Generally speaking, the only provision a sleeping-car company makes for the safety of its customers consists in the presence of a negro bootblack, who, to judge by his treatment of the ordinary passenger, is of too violent a disposition to be trusted with firearms, though he would be easily overpowered by thieves. The conductor is no defence, as he resembles the ordinary policeman in being at the other end of his beat when wanted. With these slight precautions, the best safeguard at present is to carry as few valuables and as little money as possible. Why do not the companies provide safes, as all hotels do, or lockers?

The Chinese laborers are coming in rapidly under certificates from their own Government that they are travellers or traders, which our Custom-house is compelled to acknowledge, though from their appearance it may be as plain as possible that they are neither one nor the other. In addition to this they are smuggled in freely from British Columbia by way of Puget Sound. Another judicial decision has just declared that Chinamen who left this country before the passage of the act are entitled to come back again. So that in one way or another the supply of Chinamen cannot be said to be seriously diminished by the late restrictive legislation. This will have to be amended this winter if it is intended to be really operative, and there is only one way to make it really operative, and that is to authorize the summary slaughter of all Chinamen found within the country after a certain date, and then to offer a reward for the heads of all Chinamen caught after another still later date. In no other way can our Christianity be saved from the debasing influence of these heathen. The mere irritation, in fact, caused to certain classes of our people by the spectacle of Chinese frugality, industry, and cleanliness, is of itself a reason for their destruction of Chinamen, for nothing breaks down character more rapidly than constant irritation.

If the progress of the general business of the country may be estimated by the traffic of the railroads—and this is perhaps the best general index—it is more satisfactory than the prevalent talk of "depression" would seem to indicate. The October earnings of 59 railroads, operating 50,179 miles of road, were $29,086,800, against $26,363,566 on 45,908 miles of road in October, 1882. The gain of $2,723,234 is nearly 11 per cent. in earnings on an increase of a little more than 10 per cent. in the mileage, and that, too, consisting almost entirely of new and uncompleted branch lines, which could not be expected to earn in proportion to the older mileage. Moreover, this increase of 11 per cent. in earnings in October is by comparison with the corresponding earnings of 1882, which were 16 per cent. greater than those of 1881; so that the growth of business has clearly been continuous. The profits of general mercantile and manufacturing business this year have undoubtedly been small, in consequence of the continued decline of prices of commodities up to about a month ago, when prices for all the great staples seemed to have touched bottom. Since then there has been some general improvement in this respect. Mercantile credit has certainly improved in the last month. Failures of importance have ceased, and though money continues idle, there is more confidence in regard to all enterprises than a month ago. While the volume of our export trade is smaller than at this time a year ago, there is a very important difference between the situation now and then. In the year ending September 30 ult., our foreign trade showed a net balance in our favor of $117,326,909, whereas in the year ending September 30, 1882, there was a balance against us of $12,054,492. The effect of this great change is that specie is now beginning to move to the United States from Europe. In the week ending November 10 the imports of specie at New York were $1,819,296; on Monday, the 11th, they were $530,000, and there are now known to be between $500,000 and $700,000 more to arrive in a day or two.

The *Herald*, in speaking of the pressure for the recognition of Iglesias as the head of the new Peruvian Government, urges that there is no great hurry about it, as none of the European Powers has recognized any *de facto* government there since the abdication of Pierola. This is very true, but we are in a different position from any European government, for we have recognized Calderon as the head of the Government, and kept up the farce by recognizing his representative, Montero, after Calderon himself was actually carried off a prisoner to Chili. This puts us in a position of greater difficulty than any European government in South America, and may well make Mr. Frelinghuysen hesitate some time before he recognizes any new government; but the question is still, as it has been all along, not, as the *Herald* seems to suppose, what "the Peruvians themselves desire," but what the Government actually is. The desires of the Peruvians have nothing to do with it, except as proved by their acts. They might go on desiring Calderon back for years, and yet Iglesias might for all that establish a *de facto* government, as he seems to be doing.

The celebration of Luther's birthday on Sunday seems to have been enthusiastic through the whole Protestant world, and especially the German-speaking world, both here and in Europe. Sermons on his life and work were delivered in most of the Protestant pulpits in this country, in which he was warmly eulogized from every standpoint. Two Catholic priests appear to have taken him up, one of whom, Dr. Brann, gave a sad account of the reformer, accusing him of having led a vicious, if not criminal, life. According to this authority, Luther and Melanchthon on one occasion got drunk together at Weimar, and for fifteen years before Luther's death he spent every night in a tavern, "drinking beer and abusing the Pope," which must have been very dreary work for a man of intellectual tastes. The other, Monsignor Capel, dealt more tenderly with Luther personally, accusing him simply of breaking his vow of chastity and writing indecent letters. Monsignor, in fact, devoted himself mainly to showing that the Church was not as corrupt at the time of the Reformation as the Reformers said she was, and that, even if she were, it in no way diminished her spiritual authority. As to Protestantism it leads straight, he says, to agnosticism and communism. But then the Catholic Church, after all, led to Protestantism, so that the question of responsibility for the horrors of Protestantism can scarcely be considered finally settled. It was the Catholic Church which produced Luther, and it seems rather hard, under these circumstances, to have its clergy pass his birthday in telling Protestants what a bad man he was, and what terrible things schism and heresy are.

For any one who reads Luther's story and considers his work, the fact that the great bulk of those who have just celebrated his achievements with pride as those of one of the greatest of Germans, have no more faith in his doctrines than he put in Tetzel's, and care no more for his Bible than he cared for the Missal, is pathetic enough. In other words, to put it plainly, the birthday of the great Reformer has been honored in his own country mainly by people who never read his Bible, and who sing his hymns rather as old war songs than as expressions of religious devotion. The truth is, that there is now but little religious belief of any kind to be found among the educated classes of Protestant Germany, and that Luther's Reformation is in their eyes rather a step in the political and intellectual emancipation of the country than a phase of religious progress. Luther is to them a forerunner of Bismarck, in short, rather than the promulgator of a new creed, or the founder of a new church. They care very little about the

nature or origin of his quarrel with the Pope. What he managed to save out of the wreck of his old faith is no more valuable in their eyes than what he lost, and his Bible interests them rather as a specimen of old German than as a new spiritual lamp provided by him for the men of his time. Rome could not have wished and probably has never expected a more complete failure of Lutheranism, in the sense in which Luther would have wished the term Lutheranism to be taken, than has actually occurred. But the failure is such that the Church profits nothing by it. Not much of his constructive work is left in Germany among the class which reflects on religious problems, but the spirit of free inquiry in which he carried it on has grown stronger than ever. The process which he applied to the Papal authority is now applied to all subjects whatever. The Bible itself has to submit to the tests and questionings to which he subjected the Pope and the councils. This, were he to come on earth again, he might soon get to understand and even enjoy, but never that strong and growing disposition of his countrymen to think only of the things of this life, and to dismiss from their attention, as inscrutable and insoluble, those problems of the hereafter with which he and most thinking men of his time were mainly occupied.

It seems likely now that Lord Rossmore, who summoned the Orangemen to attack the meetings of the Home Rulers, and wrote the impudent letter to the Government requesting that such meetings should be prevented, in order to save the Orangemen the disagreeable necessity of killing the people who attended them, will be at least removed from the magistracy. His case, it is reported, has been laid before the Lords Commissioners who are executing the office of Lord Chancellor *ad interim*, and he will probably be deprived of his commission. But he ought to be tried under the Crimes Act for inciting to violence. A few months of jail would not only do him good, but produce an excellent effect on all the fighting men of both parties. Nothing more needs cherishing in Ireland than the habit of discussion without the aid of clubs and pistols, and it has no worse enemies than the Orangemen. Indeed, they seldom open their mouths in public except to threaten somebody with some kind of physical violence.

The Ulster Conservatives in Ireland seem shocked or disgusted by Orange violence, and are trying to form a constitutional organization, in which Catholic and Protestant are to be united, for resistance to home rule, and to any extension of the suffrage, or at least to household suffrage. This is better, certainly, than the Rossmore plan of killing the Home Rulers whenever they hold meetings in Ulster. The *Pall Mall Gazette* says his letter, referred to above, is the most atrocious and "impudent" demand ever "addressed to a civilized government." But it is not half as atrocious as the approval of the armed attack of the Orangemen on the procession in the streets of Londonderry the other day, on the occasion of the Lord Mayor of Dublin's lecture, by the old Tory squire who acts as the London correspondent of the *Tribune*. He is in favor of killing the Home Rulers without notice. It furnishes a striking illustration of the ignorance, even on legal and political subjects, of men of this class in England, that this correspondent actually considered the visit of a Mayor of one city to lecture in another city of different politics as an "invasion," which such of the inhabitants as did not like it were justified in repelling with fire-arms. The *Tribune* ought to get rid of him. He is not fit to write for anything but a "society paper."

According to a London despatch, the proprietor of *Judy* has been committed for criminal libel for its comments on the inflation and expansion of telegrams practised by the Central News. There seems to be no dispute about the facts. The despatches originally received were, first: "Special Cabinet meeting, Quebec. Dynamite plot Lansdowne discovered. Arrests probable. Intense excitement. Princess indisposed, inflamed eye." And second: "Plot to explode Circassian Rimouski thwarted. Lansdowne movements circuitous. Halifax dynamiters sent trial." According to the testimony of Mr. Jennings, an employee of the News (this name somehow has familiar associations), this was expanded into a very interesting narrative, which gave all the details of the "Rimouski" plot, and attributed it to the "Invincibles." The following is a good specimen of the work: "The desperadoes were to row out to the steamer in an ordinary boat, in which were to be concealed two or three powerful dynamite machines. These machines, manufactured in the 'dynamite school' in New York, and some of which there is too good reason to believe are at present actually hidden in Quebec, were to be discharged against the *Circassian* below the water line, the miscreants hoping to make their escape in the consequent panic and confusion." The expansion of cable despatches is necessary, to a certain extent, but this is pure invention, and the proprietor of a comic paper who goes to jail for criticising it must feel that he is suffering in a good cause.

The French are now engaged in the melancholy business of voting more money for the Tonquin expedition. There is an appropriation of about $2,500,000 before the Chamber. This does not seem much to us, who do not know what to do with our surpluses, but it is a great deal to people whose deficits are very large and increasing, especially as the contest is apparently only just beginning. M. Ferry tried to make the Chamber believe that no more troops would be needed, but he cannot succeed. Everybody feels in his bones that a great many more troops will be needed. There is some talk of mediation between France and China on the part of a friendly Power—probably England, which is half expecting to be asked for something of the kind; but England is in too bad odor in France just now to be accepted by the French as a mediator. Negotiations, too, are said to be about to be opened in London by M. Waddington, for the execution of a tripartite commercial treaty between France, England, and China, but this can hardly come to anything as long as the war cloud remains in the East—and there it does remain. China is still inflexible, and France has gone too far, apparently, to accept what China offers without humiliation.

A French economist, M. Neymarck, makes some calculations in the *Journal des Economistes* touching the present cost of keeping the peace in Europe generally, the bearing of which on the great problem of poverty which we discuss elsewhere, is obvious. They are startling enough for those who are uneasy—as many are—about the stability of our present social organization, and about the progress of communistic ideas. There is now spent annually in Europe on the maintenance of fleets and armies nearly $900,000,000; nearly 3,200,000 men are kept under arms, and 1,800 ships, most of them very costly, are devoted to military purposes. In this no account is taken of the loss caused by the withdrawal of these men, all in the flower of their youth, from industrial pursuits. Moreover, every European country now has an enormous debt, contracted wholly, or almost wholly, for war or preparation for war, and the annual charges on this are nearly equal in amount to the annual cost of the army and navy. For instance, England spends annually on the army and navy (about) $142,000,000; on the interest of the public debt $156,000,000. Italy spends $52,000,000 on her army and navy, and $71,000,000 on her debt. Russia spends $178,000,000 on her army and navy, and $160,000,000 on her debt. Austria spends $63,000,000 on her army and navy, and $113,000,000 on her debt. France spends $160,000,000 on her army and navy, and $150,000,000 on her debt, and so on, all through the list. The rule is that every country spends nearly the same amount on the army and navy that it has to raise for the interest on its debt. The small states, like Denmark, Holland, and Sweden, who know that they could not keep the field for a week against any great Power, run just the same rig as Germany, or France, or Russia. If the United States kept up an army on the same scale, in proportion to population, as Europe taken as a whole, we should now have 500,000 men under arms, not counting reserves of any kind. If we followed the example of the great military states, we should have more nearly a million.

The public debts of Europe, too, have nearly doubled in fifteen years; that is, they have risen from $13,200,000,000 to $21,600,000,000. The cost of government has risen in ten years 50 per cent. At the present rate of progress, in fifty years, or even in twenty-five, there must be a great social or financial catastrophe of some kind, for the simple reason that the tillers of the soil, on whom these prodigious burdens rest, will not be able to stand them. Moreover, these great fleets and armies are not maintained, as the Roman legions were, to protect the civilized world from barbarians or to clear the seas of pirates. We have no longer Goths or Huns, Turks or Tartars to fear. They are maintained by highly civilized Christian men simply as a defence against other highly civilized Christian men.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, November 7, to TUESDAY, November 13, 1883, inclusive.]

DOMESTIC.

A MEMBER of the Administration, as to whose knowledge on the subject there can be little doubt, said on Friday to a newspaper correspondent: "Chester A. Arthur is a candidate for the Presidential nomination. I know it, and I do not know that there is any necessity for keeping quiet about it any longer, and I think that before long the party will have no doubt that he is a candidate. The result of the election in New York has, perhaps, made it proper that the candidacy should be avowed."

Opinion is divided in Washington political circles as to the effect of the elections on the Speakership prospects. One view is that Mr. Randall's chances have been strengthened, because the result in Virginia has revived the old issue of the solid North and solid South. Mr. Randall's actions in the past will, it is thought, win him the confidence of conservative men in the North. Another view is that Mr. Randall has lost strength because of the Democratic defeat in his own State of Pennsylvania. It is believed that the strength of Mr. Cox is increasing, and that he will have a large vote on the first ballot.

Mr. Carlisle arrived in Washington on Sunday. He expresses himself as confident of success in his race for the Speakership. Other candidates are expected to arrive there during the week and the canvass will be actively begun. There are reports of a probable combination between the supporters of Messrs. Cox and Carlisle if it is necessary to defeat Mr. Randall. Ex-Senator Eaton, of Connecticut, is considered a probable "dark horse" in that event.

Mahone's defeat in Virginia has created a great deal of comment in political circles. On Thursday the Richmond *Whig*, the organ of the defeated Readjuster, asserted that Mahone had not abandoned his hold on Virginia, but would renew the debt question. Doubts have been expressed whether Riddleberger, Mahone's colleague, will act with him in the Senate. There have for months been reports of differences between him and Mahone. He has been thought disposed to resume his relations with the Democrats. The whites predominate in his part of the State. Intimate friends of Riddleberger believe that he will, for the present at least, occupy an entirely independent position. He has reaffirmed his friendship for the Readjuster "boss." Mahone attributes his defeat to the Danville negro riot, and to lack of substantial support from the Republicans, and especially from President Arthur. He has expressed himself very forcibly as to the lack of practical sympathy from the Administration. It is believed that the popular Democratic majority in Virginia is about 30,000. In the Legislature on joint ballot the Democratic majority is about 40.

It is said that a Readjuster Committee will call upon the Republican National Committee when it meets in Washington in December, and ask for recognition and friendly counsel.

A large meeting of the citizens of Danville, Va., was held on Saturday, and it was resolved to appoint a committee of forty to investigate the recent negro riot, and set the exact facts before the public.

There were rumors on Friday and Saturday of an uprising of negroes in Southampton County, Va. A drunken negro was responsible for the statement that 1,000 of his race intended to slay every white person in the county. The whites armed themselves in preparation for an outbreak, which has not yet occurred.

Butler's vote in Massachusetts was about 150,000. Robinson's plurality was more than 10,000. Governor Butler professes to be complimented by his large vote, and expresses an intention of running again for the office of Governor next fall.

By a recent modification of the civil service rules which has been made by President Arthur, a very important reform has been effected. When the names were certified by the Commissioners to the different departments it was possible for partisanship and favoritism to be exercised in the selection of the persons certified. By an amendment to rule eight that opportunity has been removed, and the President has notified all executive officers and all Federal officials under whose jurisdiction the civil-service law is put in operation, that, in the selection from the persons certified, no discrimination is to be made by reason of any political or religious opinion or affiliation.

The jury at Washington in the suit of Hallett Kilbourn against John G. Thompson, Sergeant-at-Arms of the House, for $350,000 for false imprisonment, returned, on Wednesday, a verdict of $60,000 for plaintiff. A motion for a new trial was made by the defence.

The Court of Inquiry appointed by the Secretary of War to investigate all the circumstances attending the organization, fitting out, and subsequent failure of the Greely Relief Expedition, met at the old Navy Department Building, in Washington, on Thursday morning, all the members being in attendance. Several days were occupied in examining documentary evidence.

Gen. D. B. Sackett, Inspector-General of the Army, in his annual report to the Secretary of War, states that the inspections of the accounts of all officers of the army who have disbursed public moneys show that the public funds for army purposes have generally been disbursed in a proper manner.

In his annual report, Judge-Advocate-General Swaim, of the Army, says that the number of records of trial received, revised, and recorded during the year ended September 30, 1883, was 1,985—being an increase of 131 over the preceding year.

Col. C. G. McCawley, commandant of the United States Marine Corps, in his annual report, dated October 1, 1883, states that on that date there were 1,887 enlisted men in the corps, 883 of whom were on board ships in commission, and 1,004 doing duty at the several shore stations. He invites attention to the necessity of an increase of privates.

A vote taken in Dakota on November 6 resulted in a large majority for the new Constitution.

A large majority of the members of the new Iowa Legislature are opposed to the submission to the people of the prohibitory constitutional amendment.

Part of the new wing of the Capitol of Wisconsin at Madison fell on Thursday afternoon, burying thirty workmen in the ruins. Four were killed and twenty injured. It is the general opinion that the disaster was caused by the work being rushed along too rapidly.

Statistics published on Friday show that the peach crop of Delaware last season was about 5,000,000 baskets.

Seventy-nine Chiricahuas have arrived at Silver Creek, Arizona, and have surrendered in accordance with terms made with General Crook in May last.

The usual November "cold wave" that ushers in the winter season, traversed the continent during Sunday and Monday, accompanied by snow squalls in many places. There were severe gales along the coast and on the lakes. Many disasters to vessels were reported, with some loss of life. The weather moderated on Tuesday.

A fire which broke out in Shenandoah, Pa., on Monday, in the United States Hotel, burned sixteen blocks, including many of the principal buildings in the place. Two hundred and fifty families are homeless and have lost everything. The loss is estimated at about $500,000. The Council and citizens have appealed to the public for help, either in money, provisions, or clothing.

The failure was announced on Tuesday of Tillinghast & Co., of Chicago, the oldest wool and hide house in that city, and the largest in the West. The immediate cause of the failure is ascribed to the fact that the firm advanced a large sum of money, for the purchase of furs, to its agent in Montana, who has thus far failed to make any returns.

In the trial of the Faïence Manufacturing Company, before Judge Brown in the United States District Court in this city, for the recovery of $50 penalty for a violation of the United States postal laws by the employment of Boyd's Letter Express for the distribution of letters and circulars in the city, the jury on Friday evening rendered a verdict in favor of the Government. This was a test case growing out of recent action by the Government in suppressing private letter expresses.

William E. Brockway, the noted forger and counterfeiter, and two of his associates, Nathaniel D. Foster and Lewis Martin, were arrested on Saturday afternoon, in this city, by Inspector Byrnes's detectives, on the charge of counterfeiting bonds of the Morris and Essex Division of the Delaware and Lackawanna Railroad Company, and of the Central Pacific Railway Company, worth $54,000. The arrest was the result of detective work for a period of two months.

A large and beautiful exhibition of chrysanthemums was opened at Horticultural Hall, in this city, on Wednesday, and held for several days.

The Feuardent-Cesnola libel suit still continues on trial in this city. A great mass of evidence has been introduced during the week.

Mr. Matthew Arnold lectured in Boston on Wednesday evening. He had taken advantage of the criticisms on his delivery, and could be heard in all parts of the house.

Gen. William T. Sherman received a hearty welcome from the Grand Army of the Republic in New York on Friday night at the rooms of Koltes Post. He made a speech which was enthusiastically cheered. He was serenaded by 500 veterans in St. Louis on Monday night.

Chief-Justice Noah Davis, at the opening of the Court of Oyer and Terminer in this city, on Monday, charged the Grand Jury to consider the recent coupon frauds in the Comptroller's office, the irregularities in the Department of Public Works, and in all municipal offices.

Dr. J. Marion Sims, the distinguished physician and surgeon, died very suddenly on Tuesday morning of heart disease, at his home in this city. He attended a patient on Monday evening, and when he retired to bed he was apparently in his usual health. He was seventy years of age. He was the author of a number of medical works and had a wide reputation in Europe, where he frequently lectured. He was the organizer of the Woman's Hospital in this city.

Judge E. Darwin Smith, one of the best-known lawyers of western New York, and for twenty-one years a Justice of the Supreme Court, died in Rochester on Sunday, at the age of seventy-seven.

Admiral J. B. Creighton, of the United States Navy, died at Morristown, N. J., on Tuesday.

Theodore F. Randolph, ex-United States Senator and ex-Governor of New Jersey, died suddenly of heart-disease on Wednesday morning at his home in Morristown, New Jersey. He was born June 24, 1826. He

entered public life in 1860, when he was elected to the New Jersey Assembly. In the following year he entered the State Senate. He was elected President of the Morris and Essex Railroad in 1867, Governor of New Jersey in 1868, and United States Senator in 1874.

Ex-Gov. Natt Head, of New Hampshire, died on Monday in Manchester, at the age of fifty-five. He was one of the most prominent Republicans and business men in the State. He was elected Governor in 1878.

John T. Short, late Professor of History and Philosophy in the State University at Columbus, Ohio, and author of 'The North Americans of Antiquity,' died on Sunday.

Charles A. Meigs, United States Bank Examiner in this city for the past twelve years, died at sea on November 3. He was sixty-seven years of age.

Intelligence has been received in this country of the death in Dublin of Dr. Robert D. Joyce, formerly of Boston. He was best known as a poet by his works 'Deirdré' and 'Blanid.'

Festivals in honor of the 400th anniversary of Luther's birth were held all over this country on Saturday and Sunday. Special services were held in all the Lutheran churches on Sunday, and many other denominations took note of the event. A great meeting was held in the Academy of Music, in this city, on Tuesday evening, at which addresses were made by the Rev. Phillips Brooks and others.

FOREIGN.

Like festivals were held on the same days in most of the cities and towns of Germany, and in many other places in Europe. In Berlin, 80,000 school children took part in the procession. At Erfurt, where Luther first entered the Augustine Monastery in 1501; at Eisenach, where he was confined for ten months in the castle of Wartburg; and at Nordhausen, the corner-stones of monuments to be erected in honor of the great reformer were laid on Saturday with ceremonies appropriate to the occasion. Many towns of England celebrated the day. In London, on Saturday evening, a large meeting was held in Exeter Hall, at which Lord Shaftesbury presided. Special services were held in 300 London churches on Sunday.

The Tonquin question excited a great deal of attention for part of the week. It was reported in Paris on Wednesday that Doctor Harmand, the French Civil Commissioner in China, had asked to be replaced. This has not been confirmed. It was also announced that General Fang, a distinguished Chinese general, was preparing to take command of the forces of that country. The Chinese troops were reported to be gathering in large numbers on the Tonquin frontier. Throughout the empire military preparations were being actively pushed. The Marquis Tseng said war might occur at any moment. A more pacific rumor was that M. Waddington, the French Ambassador at London, would resume negotiations with the Marquis Tseng, and both diplomats were to have the advice of Lord Granville. Marquis Tseng on Tuesday left England for Paris.

In the French Chamber of Deputies on Thursday Admiral Peyron, Minister of Marine, presented a bill providing for a supplementary grant of 11,500,000 francs to cover the expenses of military operations in Tonquin. The bill was referred to a special committee.

An interview with M. Ferry, the French Premier, was published in London on Friday, which contained the following points. With regard to China, M. Ferry entertains the opinion that the Chinese diplomatists are neither frank, honest, nor ingenuous. He utterly disbelieves in the military power of China, and is firmly convinced that there is not the remotest chance of that country going to war. Tonquin, he said, was not a Chinese possession. France had treaty rights over Tonquin, and would not retreat from her position at the dictation of China. When the French were firmly established in the Red River Delta another market would be opened, and the Chinese would then acquiesce in the *fait accompli*. He also denied that France had any intention of annexing New Guinea.

Victorin Ferdinand Barrot, a distinguished Bonapartist politician of France, died on Tuesday.

Marshal Serrano has been appointed Spanish Ambassador to France in the place of the Duc de Fernan-Nunez. The French Government, in expressing its acquiescence in the appointment, used the most flattering terms in regard to the Spanish Cabinet.

It was announced on Thursday that the Crown Prince Frederick William of Germany expected soon to pay a visit to King Alfonso of Spain. The proposed visit has created excitement in Madrid. It is feared that France may perceive in the visit a fresh element of irritation. The Berlin journals warmly approve the proposed visit. Bismarck's organ says that the visit is not aimed at France, but is made in the interests of peace.

A pamphlet published in Madrid by an ex-army officer, who is now secretary of a Spanish Republican military association, giving the history of the late military rising, asserts that forty-four regiments and 3,000 officers of the Spanish army were concerned in it. It also accuses Ruiz Zorilla of winning $75,000 on the Stock Exchange during the excitement consequent upon the rising, and asserts that if the insurrection had succeeded, Zorilla would have shot Señor Moret, now Minister of the Interior, and several generals.

In a recent circular of the Spanish Minister of Finance he asserts that Spain has arrived at a degree of prosperity unknown for many years, the budget showing a surplus.

M. de Giers, the Russian Secretary of Foreign Affairs, arrived in Berlin on Tuesday, and called upon the Emperor William. He will visit Prince Bismarck.

The Pope has informed Dr. von Schloezer, Prussian Minister to the Vatican, that the question of the removal of Cardinal Ledochowski and Archbishop Melchers, from the Archbishoprics of Posen and Cologne respectively was a matter which could not be solved until the question of the liberty of education of the clergy in Prussia was settled. A Rome despatch asserts that the disputes of the Pope with Prussia will be settled within the month, and amicable relations will be restored.

Prince Bismarck has had a return of jaundice. Continuous work has been forbidden by his physicians.

The Lord Mayor's show in London on Friday was unusually fine. Alderman Fowler, M. P., was inaugurated Lord Mayor. In the evening he gave a banquet in Guildhall. M. Waddington, the French Ambassador, replying to a toast in honor of the foreign Ministers, said there was no greater guarantee for the peace of the world than hearty, cordial, and loyal friendship between Great Britain and France. France had made great progress, and he had every confidence in her future. France wished to approach Great Britain in a spirit of good-will, and he was met with the same desire on the part of England. Mr. Gladstone, referring to M. Waddington's speech, said: "Our hearts' best wishes are with France in every career of peace, justice, and orderly government on which she may find it her interest to enter." All the great Powers of Europe, he said, had declared their attachment for the cause of peace. With regard to Ireland he said: "There is much to be done, much to be desired, much to be lamented, but there is also much to be hoped for. Peace and order must be firmly maintained." M. de Lesseps also spoke.

The Lord Mayor of London on Saturday refused to allow Doctor Stöcker, Chaplain of the Court of Germany, to lecture in the Mansion House. He said that he could not disregard the feelings of the Jewish community of London by giving prominence to a man who had excited hostility against the Jews.

The trial of Joseph Poole for the murder of John Kenny in Dublin on July 4, 1882, was begun in that city on Monday. Poole was charged with having lured Kenny to the place where he was murdered. William Lamie, the informer, testified against him. The jury, on Tuesday, after an hour's consultation, disagreed and were discharged. The prisoner was remanded for another trial.

The London police authorities offer a reward for information of the whereabouts of John McCafferty, who was convicted of treason in Dublin in 1867, and sentenced to penal servitude for life. He subsequently escaped.

It is understood in London that official papers in regard to the conduct of Lord Rossmore relative to the recent Orange demonstrations in Ireland have been laid before the Lords Commissioners of the Great Seal. The charge made is that Lord Rossmore, as Grand Master, summoned the Fermanagh Orangemen to resist the Parnellite invasion of Roslea.

A Dublin rumor is that influences are at work in certain circles with a view to making Lord Lorne the Viceroy of Ireland.

The Dublin *Freeman's Journal* has published the full text of a circular proposing wholesale emigration from Ireland which, it is alleged, the Government issued, though the authorities have disavowed any connection with the paper.

Ramsgate, England, was decorated and illuminated on Thursday in honor of the opening of the centennial year of the life of Sir Moses Montefiore, the Jewish philanthropist and baronet. He founded a Jewish college in Ramsgate in 1867. Queen Victoria sent a message of congratulation to him.

An explosion took place at the Moorefield colliery, at Accrington, Lancashire, England, on Wednesday morning, by which 110 miners were imprisoned. Sixty-three persons perished; the rest were rescued alive.

Edward C. Maddison, financial agent, of London, failed on Saturday, with liabilities estimated at about $1,000,000.

The report of the death of M. de Brazza, the French explorer, in the Congo country, Africa, was officially denied in Paris on Monday.

There is reason to believe that the Egyptian Government is not disposed to admit M. de Lesseps's monopoly in the construction of the new Suez Canal.

It was reported in Cairo on Wednesday that El Mahdi, the False Prophet of the Sudan, was dead. Another rumor was that a powerful rebel tribe near El Obeid had given its submission to the Governor of Khartum.

It was semi-officially reported in Belgrade on Monday that the insurgent bands in Servia had broken up and had surrendered to the regular army everywhere. Later reports, however, showed that the revolt was increasing in strength.

M. Nikola Christies, the Servian Prime Minister, says that the present state of affairs in the kingdom is the result of Radical intrigues. The programme of the Radicals, he asserts, is the dethronement of King Milan and the proclamation of Queen Natalie as Regent until Crown Prince Alexander becomes of age.

The whole Chilian expeditionary force is in Arequipa. The Bolivian army is concentrating near Oruro. Montero is now in Bolivia.

The Congress of Honduras recently met and promptly accepted the resignation of President Soto, and ordered the election of his successor. There are four candidates in the field.

THE ELECTIONS.

Happy as the Democrats are over the result of the election in Virginia, we doubt if they have as much real reason for thankfulness as Republicans. The defeat of Mahone and the Readjusters merely leaves Virginia a Democratic State, and that the country at large can endure this is proved by the fact that Virginia had gone Democratic in all the national and State elections from 1873 down to the appearance of Mahone, and yet the country at large survived it and even throve under it. Had Mahone, on the other hand, been successful, several consequences would have ensued which Republicans might well have dreaded. They would have had to look forward to a campaign next year with Virginia as one of the "pivots" on which the election would turn; and they would have had to carry the State with the aid of a faction pledged to sweeping repudiation of State debts, to open and defiant debauchery of the civil service, and to blackmail of office-holders. That the Republican party could shoulder such a burden as this in a national election with advantage to itself, we very much doubt. It has been very difficult for decent Republicans to stomach the support of Mahone by the Administration during the past year. They have only managed to do it because it was an "off" year, and they had been led to hope that the appearance of Mahone on the scene meant a division of the white vote and "new issues." Some Republicans even persuaded themselves that the Readjuster issue, although the most demoralizing that could have been brought forward, was a good thing on account of its novelty, and the apparent probability that a new chance of cheating their creditors would rally blacks and whites enthusiastically to the same ballot-box, who otherwise would have watched each other with suspicion and distrust. But it has been very hard work for them.

The support of Mahone by the Administration has been generally explained as the result of a desire to bring Virginia into "the Republican column" for 1884; and the idea that this could be done by "Mahoneism" is a curious sort of survival of Reconstruction politics, which could only have been seriously entertained by a President who, like Mr. Arthur, is a Stalwart at heart. Mahone's explanation of his defeat, in fact, sounds somewhat like the talk of a belated manager of one of the Returning Boards of the Hayes-Tilden period. The great importance of the election, he says, arises from "the impression" it will "make upon the people of the North." He mentions "fraud, intimidation, and the corrupt use of money" as the chief causes, and he declares that the Danville riot was a "preconcerted" Democratic outrage to keep the negroes away from the polls. But here, curiously enough, he stops. He does not go on as he would have done six or seven years ago, and predict that there is but one way to meet this. He has no remedy to propose. He says, somewhat darkly, that "when a man fires the grass he ought to know beforehand what will be in the way of the flames"; but he does not explain what he means by this. In other words, he and his friends are now brought face to face with the fact that, in their attempt to bring Virginia into the "Republican column," they have overlooked the most important point in the whole affair—that this sort of a campaign cannot be conducted successfully without the use of force, and the use of force is no longer possible.

The defeat of Mahone will probably convince the Administration that time spent in trying to revive the politics of the Reconstruction or Outrage period is time thrown away, and that the surest way to keep up a solid South and to prevent States from coming over to the "Republican column," is to try to build up a party there by means of Federal patronage. With Virginia in its present condition, it is difficult to imagine anything worse for Republicans than to have a national election turn upon their being able to carry it; and happily it now seems probable that the end of Mahoneism there means that they must carry New York or lose the country. Now, New York politics have a bad name throughout the country, owing to the condition of the city government and the great influence of the city politicians in the councils of the Democratic party. But the truth is, as has been frequently proved during the last thirty years, that no State in the Union possesses so large a body of independent voters, who can be relied on to check party excesses or punish party scandals with swiftness and vigor. Whenever the time seems to have come in this State to bring demagogues or tricksters to their senses, they are not left in any doubt as to the popular feeling about them by being beaten, if beaten at all, by small majorities after a hard struggle, as Butler has been in Massachusetts. They are literally, as the prize-fighters say, "knocked out" by a blow so tremendous that they are saved the trouble of all subsequent discussion as to what it means. No party, in fact, in this State is allowed to think itself secure in the possession of power, except from year to year. Nobody can figure out the result of next year's election from last year's returns, or flatter himself that the devices of one campaign will do equally good service in the next.

For instance, General Grant had a majority in this State over Greeley of 53,456 in 1872, which looked as if, with economy, it ought to last the party for ten years at least. But, as a matter of fact, four years of "Grantism" so disenchanted the independent voters that in 1876 Tilden had a majority over Hayes of 32,742. The Gubernatorial vote illustrates the matter still more strikingly. Dix (Rep.) had in 1872 almost the same majority over Kernan as Grant over Greeley—or, 53,451. But this was so frittered away by Republican excesses that in 1874 Tilden (Dem.) had 50,317 majority over Dix, showing a shifting of about 50,000 votes. In 1876, Robinson (Dem.) had nearly the same majority over Morgan (Rep.) as Tilden over Hayes. But three years later, in 1879, Cornell (Rep.) had 46,777 majority over Robinson. The illustration is less good, however, in this case, owing to the fact that Kelly ran as an independent Democrat, and carried off more than 60,000 votes.

Of what happened last year it is hardly necessary to speak. The Republican managers had become so blind to the signs of the times that they chose that year for a special display of contempt for everything the independents and reformers of all classes had been asking for. By way of answer to the clamor against assessments on office-holders, they collected these assessments with greater method, more publicly, and in larger amounts than perhaps ever before. By way of showing their scorn for reform talk, they spent part of the campaign funds on a scurrilous official pamphlet, filled with gross abuse of the leading persons connected with the civil-service-reform movement. The officials violated the statute against assessment with much ostentation, and the prosecution of one of them was met with a sort of mockery by a demurrer to the indictment on the ground that there was a mistake in his baptismal name. They opened an office behind the Custom-house and ordered the clerks to bring in their contributions without delay. Finally, they singled out the man of all men in the party, within this State, whom they knew to be most obnoxious to the reform sentiment and most associated with party abuses in the public eye, and made him Chairman of the State Committee. The result was that their State ticket was defeated by 192,854. The blow was so tremendous that they never said another word about the matter. The managers simply disappeared for some weeks from the public gaze. Then the Democrats began to think that their good time was coming, and that this majority of 192,000 was a sort of unexpected bequest to them from a deceased uncle, which they could do what they pleased with. It seemed this time last year inexhaustible, or, at all events, good till 1884. So they fell to denouncing the reformers in the old Republican lingo, and ridiculing the working of the Civil-Service Act, and encouraging "the boys" to get ready to come in and have "their toes warmed," or, in other words, began to promise them a great debauch in spoils after the next Presidential election. As the Republicans had started a young newspaper reporter for Congressman-at-Large last year, the Democrats determined to start a young newspaper reporter for the Mayoralty of a great city this year, by way of showing the public what sober-minded, careful, and conscientious men they would be when they got hold of the Presidency, and how needless it was to ask for any more explicit declaration of their intentions than an expression of readiness to take possession of the offices.

The Republicans, on the other hand, have shown that they have profited by last year's disaster. There have been no assessments, no notes of defiance to reformers, or of contempt for the law, no lavish expenditure at headquarters, no open parading of obnoxious workers. The result is that the Democratic majority has disappeared as in the twinkling of an eye, and all the hopes built on it about 1884 have been ruined. The lesson of it all is that neither party can count on New York, except through good behavior.

DIVORCE AND ITS INCREASE.

The State of Massachusetts has just issued a report on divorce, giving a history of the

legislation in that State and showing the present condition of the evil. The report is accompanied by some editorial remarks prepared by Dr. Frank Wells, in which he reaches the conclusion that practically little or nothing can be done by law to check the spread of divorce. He thinks that it must be left "to educators, to social scientists, to the Church, and, by no means last, to parents, to apply the relief." But even here, when he comes to details, it is evident that what he really has in view is a general improvement in the tone of the community, which, if it diminished divorces, would do so as it would diminish burglaries and murders, by operating indirectly on the causes which render them so common. Curb the "selfish individualism" which is the curse of the times, he says; cultivate the domestic affections in the young by "making home attractive"; provide amusements and instruction for the masses on all days in the week, particularly their only holiday, Sunday; check the spread of intemperance by multiplying coffee-houses and other places for cheerful recreation; encourage the promotion of "social clubs and the like" in rural communities, etc. These recommendations are evidently chiefly important as implying that, in the opinion of Dr. Wells, all direct attempts to solve the "divorce problem" may as well be given up. The sort of general social amelioration which he proposes has in fact actually been going on within the period during which the tendency to divorce has become so marked. Strenuous efforts have been made, for instance, to check the spread of intemperance, both by the force of social opinion and by law, while the multiplication of places for cheerful recreation is a marked peculiarity of our day. Music, cards, dancing, lectures, all sorts of sports, have taken the place of the hard drinking which was the chief social recreation of the New Englander in earlier times; yet as he has familiarized himself with the gospel of cheerfulness his notions about marriage have become more and more loose. So that, whichever way we look at it, the result seems to be that nothing of much importance can be done by the Legislature.

A very different view of the subject is taken by Mr. Leonard Woolsey Bacon, in an article contributed to the last number of the *Princeton Review*. He insists that the law on the subject of divorce (and the general drift of legislation has been very much alike all over the country) ought to be changed, and changed at once, very materially. In the first place, he would have a *locus penitentiæ*, or what he calls "cooling time," in all proceedings for divorce—in other words, that the divorce should not be made absolute at once. In the second place, he would have the State represented in all divorce proceedings. In the third place, he would have it obligatory upon the plaintiff, in case the application rests on a charge of crime of any kind, to have the crime punished by an ordinary prosecution. For another thing, he would have the guilty party prevented from marrying again. All these recommendations seem very good; and if they were new, we should say that they might accomplish great results. But they are not new at all. Mr. Bacon might have found them all embodied in the actual legislation of the American States in which divorce is on the increase. There is nothing in the experience of these States to show that the progress of divorce can be sensibly decreased by them, though undoubtedly they are palliatives.

But there is one thing that Mr. Bacon admits could be done. Probably "the most difficult part of divorce reform is that which relates to abuses growing out of the diverse and discordant laws of the different States." This is what makes all statistics in any one State of little value. We know from them what divorces are granted by the courts of that State, but not where the parties really came from, or how far the divorce was in fraud of obligations contracted in another State. Now, as to this, the only cure is a uniform system, and the only way to get a uniform system is through an amendment to the Constitution giving power to Congress to regulate the matter. Curiously enough, this proposal excites Mr. Bacon's utmost horror. He declares that while this would be a good thing for the family, it would be fraught with terrible results to constitutional government. He draws, in fact, from the suggestion the somewhat amusing conclusion that the existing abuses of divorce constitute at present "the most formidable danger to the perpetuity of the American Constitution." The abuses are getting so bad that unless they are reformed by the States the agitation against them will become so violent that the Constitution will be amended, and, as we understand Mr. Bacon, no amendment is practicable on this subject which does not involve the open abandonment of our system of federated national government. Mr. Bacon seems to overlook the fact that the subjects of bankruptcy, of copyright, of patents, and even (in some important respects) of contracts, have been committed to Congress already. How the power to pass a uniform divorce law would alter the nature of the Constitution we do not see; but at any rate, no one can read his article without seeing that we have got to choose between this and going on as we have been going—and, to judge by the Massachusetts statistics, this is just what we can hardly afford to do.

"COLLECTIVITY" IN ENGLAND.

POLITICS in England seem to be running in the direction of socialism with a rapidity which nobody even ten years ago appears to have in the least foreseen. The Irish Land Act is a step that way of which, even so late as 1875, probably no politician of note would have admitted the possibility. Of course there has been already in England plenty of special legislation for the protection of the landed interest. The Corn Laws were a plan for enabling the landlords to make money during hard times. There has, too, since the abolition of the Corn Laws been a great deal of state interference between employer and employed for the protection of the latter against fraud and oppression. But there has always been something sacrosanct about land in Englishmen's eyes, which has made it seem the very last thing with which the state ought to meddle to the prejudice in any degree of the owner of the fee. The proposal that the state should step in and fix rents was made many years ago with regard to Ireland, but it was regarded in the House of Commons, to say nothing of the House of Lords, as too chimerical for discussion. Its sudden embodiment in legislation, therefore, as the result of two years of Parnell's agitation, is a shock from which the laissez-faire school of economists have not yet recovered. It seems, moreover, now to have really given the Liberal party an impetus toward what the French call "collectivity," of which it is impossible to foresee the end, and which is already alarming the more timid and moderate.

"Collectivity," in the dialect of the Socialists, means the ownership of all the instruments of production by the state, and its use of them in such manner as shall seem best calculated to eradicate or diminish poverty. The English Liberals are a long way from advocating anything of this kind in terms, but they have just committed themselves to a doctrine which may bring them to it in a shorter space of time than most of them probably imagine. They have virtually proclaimed it to be the duty of the Government to see that the poor are comfortably lodged—a stupendous undertaking, as every one may see who takes the trouble to calculate how many poor there are in England, and what it costs to lodge a family decently. The London *Spectator*, which is by no means the most practical or cautious of the Liberal organs, was so alarmed by this that it warned the party solemnly against being chimerical, and probably a good many others wished after the declaration was launched that it could be recalled, and hoped that in the coming discussion over the county franchise and the redistribution of seats it might be forgotten, or put into the background.

The question has, however, been brought to the forefront with startling impressiveness by a pamphlet issued by the London Congregational Union, with the somewhat sensational title of "The Bitter Cry of the London Poor," giving an account of the appalling misery in the matter of shelter even of the wage-earning poor of the city; of the squalor, unhealthiness, and indecency of their dwellings, and this in spite of the existence of an act of Parliament of 1875 providing for a rigid official inspection of lodging-houses. It is undoubtedly a frightful picture to present to the wealthy and luxurious class at the other end of the city, who are occupying themselves with imperialism, and art, and rare editions, and old china, and the health of the grouse and deer. It has, however, apparently done its work, for it has made the responsibility of the state for the dwellings of the working classes the great question of the day. It has, it would seem, touched the conscience of a portion of the English people, whose conscience, when touched, is a tremendous force in politics. Its effect, too, has been heightened by the appearance of an article from Lord Salisbury, on "Laborers' and Artisans' Dwellings," in the *Quarterly Review*, which is generally regarded as a sort of Tory bid for working-class support, in the form of an acknowledgment that the manner in which poor men are lodged

is the concern of the state. It therefore seems at this moment as if the two parties were about to engage in a struggle, as once before about the extension of the suffrage, to see which will be first to lower the laborer's and artisan's rent, or—what amounts to the same thing—give him a better dwelling for the same money.

One does not need to be a prophet, or the son of a prophet, to see that competition of this kind, on the eve of another extension of the franchise, in fact, on the eve of what many consider the establishment of manhood suffrage, is not likely to stop short with the offer of better lodgings. It will not be possible for the Government, after providing the workingman with a good house, to refuse to do anything more, as long as he can show that he is at a disadvantage in the market compared to other classes of society. He has as much right to good food, and good clothing below the regular rates, if he cannot get them at the regular rates, as he has to good lodgings. In fact, the principle of state responsibility in this field once admitted, it is very hard to say where it ends, and whether it should not cover everything which promotes his welfare, moral and intellectual as well as material.

Lord Salisbury acknowledges that none of the attempts to furnish workingmen with good lodgings at low rates, hitherto made, including Mr. Peabody's, are of much service to those who do not earn at least $6 a week, and have more than five in a family. A vast body of the poor in London and other large towns do not earn this or anything like it. His plan, and, as far as we see, everybody's plan, is to have the Government lend money at low rates of interest to local bodies to put up lodging-houses; but in most of the discussion Government money is talked of as if it came out of some large receptacle to which the taxpayers did not contribute. It is not at all likely that such lodging-houses as would be put up by municipalities in the present temper of the public would pay even 2 per cent. The Peabody trustees only ask 3. The local taxpayers, at all events, would be pretty sure to have a deficit of some kind to meet, and to get at the full meaning of this, one has to read what Mr. Fawcett says about local expenditure in Great Britain in the last edition of his 'Manual of Political Economy.' He says that local expenditure, if it increases during the next quarter of a century as it has increased during the last, will exceed that of the Imperial Government. The local authorities now raise $200,000,000 a year for local purposes, and have an annual deficit of $100,000, which they meet by borrowing. In Liverpool, for example, rates in 1841 amounted to less than $2 per caput of the population. They now amount to more than $9 per caput. They used, in 1841, to reach about 12 per cent. on the house rent. They now reach 25 per cent. If they go on as at present they will soon reach 50 per cent. In another place near Liverpool the rates will actually amount, at the present rate of progress, in forty years, to 120 per cent.

The truth is, that neither England nor any other country in Europe can undertake any such scheme for elevating the material condition of the poor without cutting down expenses in other directions, in ways which would greatly change its relations to the rest of the world, and would involve a great modification of its political ideals. The army and navy as at present maintained, and some other highly ornamental institutions and possessions, would have to go, before any plan of collectivity could be safely entered on. He would be a wise man, too, who could tell whither, when once entered on, it would lead any modern state. Of all the tasks that fall to the lot of government or individual the task of giving people comforts which they cannot earn is the most delicate and most difficult.

A FRENCH REVIEW OF THE TONQUIN WAR.

PARIS, October 25.

As the French Government seems completely resolved to extend our Empire in Indo-China, it will not be without interest to examine the situation of French affairs in that quarter, as set forth in voluminous documents prepared for the Chambers. It is well known that our colony of Cochin China is separated by Anam from the province of Tonquin. On the 26th of May we learned in France the news of the unsuccessful sortie from Hanoi and the death of Commander Rivière. Orders were immediately sent to the Governor of Cochin China to send to Tonquin all the troops he could dispose of, and some reinforcements were despatched from France. General Bouët, the Military Commander of Cochin China, received an order to start for Tonquin and to take command of the troops. At that moment these troops occupied only three points of the great Delta, but their communications were secure. Haiphong was able to resist, with the help of a gunboat, and had become the principal centre of resistance. The Anamites occupied Namdinh, but the French Colonel Badens was still master of the citadel. On the 19th of July he made a brilliant sortie against the Anamites, took several guns, and killed 700 men. At Haiphong the French repulsed in several small affairs the Anamites and the Chinese. It was at this moment that the new Civil Commissioner, M. Harmand, arrived in Tonquin. The reinforcements sent from Toulon and New Caledonia arrived also, and on the 30th of July M. Harmand held a council of war with Admiral Courbet and General Bouët. It was decided to make the principal assault on Hanoi, the most important place in the Delta, so as to disorganize the Black Flags, which may be considered as the best Chinese troops. At Namdinh the French were to remain merely on the defensive.

A most important event had taken place: the King of Anam had died, and his successor had not been appointed without some difficulty. It had always been understood that the affair with Tonquin could not satisfactorily be settled without an insurrection in Anam, which formed the link between Tonquin and our possession of Cochin China. It was therefore necessary to establish such relations at Hué as would practically place the King in the position of a vassal. The soul of the resistance to our arms in Tonquin was at Hué; the subsidies paid to the Black Flags came from this capital. The French commanders found their opportunity in the death of the King and the confusion which followed. In a few days all was combined for a powerful action; some pieces of artillery were lent to the squadron by the land artillery, and a small landing corps was put on board the ships. The rendezvous of the squadron was Turan, where, on the 15th of August, the Tonquin squadron met the ships sent from Saigon. On the 18th the fleet approached the entrance of the river of Hué and began the bombardment of the forts, which were well manned—one of them had been constructed long ago by a European engineer. It was impossible, however, for the Anamites to resist long the powerful fire of the French fleet, and on the 21st of August the forts of Tuan-an were all in the hands of the French. The Commissioner-General Harmand went immediately to Hué, during a truce, and from the French legation sent to the Anamite Government an ultimatum, with offers of peace. On the 25th of August the treaty proposed by him was accepted and signed. This treaty had, of course, been carefully prepared in Paris: it places Anam in a new situation, under the absolute protectorate of France. It is almost a copy of the Bardo treaty which followed the Tunisian expedition, and which has placed Tunis under the French protectorate. The administration of Anam will remain in the hands of the natives, but all the diplomatic affairs of the kingdom will be in our hands. The Court of Anam engaged itself to recall immediately all the troops which had been sent to Tonquin, and to give orders to all the mandarins with a view to the reëstablishment of peace. These mandarins have great power, and some of them are practically independent. Several of them, however, obeying the orders sent from Hué, have already entered into relations with the French authorities in Tonquin. Two of the principal ministers of Hué have gone to this province, with full powers for disbanding the Anamite troops and arresting the generals and mandarins who refuse to lay down their arms. The treaty of Hué is a great triumph for the French expedition, paving the way for the end of the war in Tonquin, which has always been very unpopular in France. At the same time, it imposes new and great duties on the French Colonial Administration. Anam becomes, in fact, a French dependency in order that Tonquin may become another, and that its splendid river may be opened to French commerce and to the commerce of the world.

Thus far the occupation of Tunisia has been very successful, but we had in our Algerine colonies a school of soldiers and of administrators who were all prepared for this comparatively easy task. I have spoken on the subject with old generals, who spent a great part of their life in Algiers, and they have all declared, "We paid dearly for our experience in Africa, but now we are reaping the benefit of it; we understand the Arabs, and know how to deal with them." Will it be so in Anam? Will it be so in Tonquin? It may be. As yet we have had no trouble in Cochin China; but there is a vague feeling adverse to this extension, which brings us near the great unknown Empire of China. If the treaty of Hué had not been signed, the present Cabinet would almost certainly have fallen on the Tonquin question; now Jules Ferry has his treaty, and he has become less vulnerable.

After the conclusion of the treaty, the Civil Commissioner left a resident at the Court of Hué and returned immediately to Tonquin, where the military operations had begun. The French Government issued a circular, in which it recalled the interdict long before made in Anam against importing arms or materials of war. The operations in Tonquin were successful; two places, Haidzuong and Kuang-yen, fell into the power of the French on the 13th and on the 20th of August. Great quantities of arms and munitions were found in these two places. After the council of war at Haiphong, General Bouët had returned to Hanoi. On the 15th of August he attacked the Black Flags, but his first successes were interrupted by a sud-

den inundation. The enemy, however, left its position, and the French kept a fortified pagoda, which was the centre of it. Still, the difficulties were such that the General asked for new reinforcements, and these were sent during the month of September. Without waiting for them, he took the offensive as soon as the state of the river and of the Delta allowed, making a sortie on the 1st of September in the direction of Sontay, under the protection of a gunboat. A fortification was taken by storm by our troops, who charged through water up to their breasts. Operations were at that moment suspended, in order to wait for the effects of the treaty of Hué and for the expected reinforcements. During this period, General Bouët, who, it is said, did not easily tolerate the authority of the Civil Commissioner Harmand, came back to France, by permission of the Minister of War. He was replaced by Colonel Bichot, and Admiral Courbet took the supreme command of all the forces on land and on sea.

At the present moment, it cannot be denied that our position in Tonquin is far better than it was a few months ago. In the month of May the French only occupied three points in the Delta; they were everywhere surrounded by the Black Flags, the Anamites, and the Chinese, in the midst of hostile mandarins. At the present moment the large Delta is completely under French control, from the sea to the summit of the triangle which is inland. The mandarins are making their submission, and one after the other obeying the orders sent from Hué. The troops of Anam are on the point of being disbanded. The population, which has never played any active part in the war, and which is submissive, is completely resigned to a new rule. The Black Flags are in retreat, and desertions are taking place in their ranks. The health of the French troops is excellent.

This is undoubtedly a satisfactory state of things, and it only remains to be seen what progress the French Government has made with the Chinese negotiators. France would not accept any other basis of negotiation than the treaty of 1874, which gives her the right to prevent any foreign intervention in Tonquin. China had at first accepted this situation; she had recalled her own troops from Tonquin, and given full powers to Li Hung Chang to treat with M. Tricou. But her attitude changed after the unfortunate sortie of the 19th of May, when Commander Rivière was killed. All at once began one of those diplomatic comedies in which the Chinese excel, and which they can play interminably. China, encouraged by the opposition in the French Chambers, by the tone of the European press, became immediately very arrogant. She went so far as to ask that new reinforcements should not be sent to Tonquin, and intimated that no permanent arrangement could be made if France did not evacuate the places which she occupied in Tonquin. From the beginning, France, in order to show her good will, had offered a rectification of frontiers; afterward she consented to the constitution of a neutral zone—a point on which the Chinese negotiators constantly insist. The object of the Chinese is to prevent any direct contact between the Europeans and the populations of the Celestial Empire. How are we to reconcile this language with that of the Marquis Tseng, a few days ago, when he was solemnly received and greeted by the Corporation of Folkestone, and spoke, as Bright or Cobden would have done, on the rapidity of communications in modern times and the necessity of bringing all nations together? Chinese diplomats are Eastern diplomats; they are treated with the same forms as civilized diplomats, but they are in many respects very different from these. They have different modes of thinking; their ideal of honor, of patriotism, of international law is quite distinct. We must not judge them too severely, as many barbarians must pass a severe judgment on our own civilization. I once heard an English statesman make this just remark: "The nations which we call barbarous are ignorant of international law and its rules, and we constantly punish them with fire and sword for this ignorance." We cannot well judge the Chinese, and they cannot well judge us. The final issue is a question of brute force. China, for the present, thinks us weak, and it is for this reason that she now claims not only the nominal sovereignty over, but possession of, Tonquin.

The pretensions of China, in our eyes, have no basis: her sovereignty is purely honorary. It has the same character as the sovereignty over many other Asiatic provinces—over Cochin China, for instance—which the French now occupy, and which China has never disputed with them. The English occupy half of Burmah; and China, though she pretends to be the sovereign of Burmah, never made any opposition to the occupation of England. The French pretensions are founded on recent treaties, that of 1874 and the treaty of Hué. On the 18th of August, 1883, the Marquis Tseng sent a despatch to our Minister of Foreign Affairs, in which the Chinese Government offered six points for his acceptance, looking to the French evacuation of Tonquin, and to the opening of the Red River to foreign navigation as far as Sontay. The French Minister lost no time in answering, and asserted French rights in his despatch of the 27th of August; he did not hesitate to say that the six points presented by the Marquis Tseng could not, in his eyes, become the basis of a useful discussion. He refused to examine the Chinese propositions. On the 15th of September a memorandum was sent by our Foreign Office to the Marquis Tseng, and its conclusion embraced these two points: first, a delimitation of the neutral zone in Tonquin; second, the opening of Manh-hao, on the Red River, in the province of Yunnan, to foreign trade. The official answer of China was only sent on the 16th of October. China offered a different delimitation of the neutral zone, and refused to open the port of Manh-hao. China wants us to abandon Tonquin, and reserves to herself the right of occupying all the northern part of Anam. Such is the price she asks for our occupation of the provinces of the South. Such is, at the present moment, the situation of things. It is clear that China is waiting for the development of events. She perhaps expects ministerial changes in France; she expects, probably, the indirect support of some European Power in the vindication of her pretended rights. But it is doubtful if she will gain much by prolonging negotiations which France can prolong, in her turn, as long as she likes.

Correspondence.

THE MASSACHUSETTS ELECTION.

To the Editor of The Nation:

Sir: Modesty is not generally regarded as a leading virtue of the people of Massachusetts, but they may reasonably assume that their State contest has attracted more or less of attention throughout the whole country. To outsiders it may appear to be merely a struggle between an unscrupulous demagogue and the decent portion of society. The question was, however, far deeper than that. Not since the war have more profound or more sharply defined political issues been involved, though they have no doubt been much obscured by personal considerations. In trying to make this clear I must cast a glance backward. Voices have not been wanting for many years to declare that the system of politics in Massachusetts (not to speak of other States and cities) was a farce and a fraud; that a thousand delegates from all parts of the State were assembled to set up as candidate for Governor a man of whom they knew hardly anything, nominated by a committee of whom they knew nothing at all, and who represented absolutely no policy and no principles beyond general virtue and respectability; that the people were expected to devote much time and pains to the election of such a candidate; that the Governor, when elected, might just as well be represented by a wax figure, as he had no more influence in making the laws, and little more in enforcing them, than an ordinary citizen. These critics further objected that, as all the principal executive officers were elected separately, no unity, continuity, or system of administration was possible; that the Legislature had absorbed all the powers of the Executive, thus reduced to insignificance, and carried on the government by means of anonymous boards and commissions, whose work, whatever else might be said of it, was both secret and irresponsible, and subject to the caprice and jobbery of the Legislature. The critics further said that with the mass of the people, who have to attend to their farms, and their workshops, and their merchandise, personal enthusiasm was the only element available in the long run; that sooner or later some vigorous fellow would jump over conventions and committees, and, appealing directly to the people, would make short work of impersonal government based upon abstract principles; and that as the respectable part of the community resolutely refused to give the Governor, the only representative of the whole State, any legitimate power, the man who should make this appeal to the people would come from and address himself to the worst portion.

We will now come to the facts of the case. Governor Butler has held a prominent position before the public for some thirty years. Though his character and record are of the worst, the people do not forget that he led the Fifth Massachusetts Regiment through Baltimore, and that when he returned from New Orleans a large audience of respectable citizens assembled in Faneuil Hall to acknowledge the success of his administration in that city. With that fertility of ideas which is rendered fatal by want of principle, he put his finger on the sore spot in our affairs by attacking the work of the commissions, and on this basis he was elected last year. The Tewksbury investigation did not reveal much that was bad, and it was conducted in the worst possible spirit and method, but the people were delighted at the enforcing of public responsibility on those who had appeared beyond reach of it. His greatest strength lay, however, in this, that he was the first man in the United States to declare open war against the usurpation and tyranny of the Legislature, and thus to begin a contest which will some day shake the Union to its foundation. Andrew Johnson, indeed, quarrelled with Congress, but it was a personal sulk. Governor Cleveland has vetoed many bills, but only as a question of details. Butler vetoed bills right and left, on the express ground that the Executive had not his proper share of power, and was a mere tool in the hands of the Legislature and the Council.

When the campaign opened this autumn it may be said that Butler held as good cards as ever fell to a candidate. If he had played them with any sort of skill he could have swept the

State. It was a clear case of suicide. His reckless and incendiary talk, his vulgarity and even obscenity, his offensive egotism and coarse personalities, disgusted all respectable people, and roused the most determined opposition.

What, on the other hand, were the Republicans doing? The first thing was to get a candidate. After some hesitation the choice fell, somewhat against his will, upon the Hon. George D. Robinson, member of Congress from this State. It is perhaps safe to say that not 5 per cent. of the population of this State had ever heard his name. Politically he represented the *status quo* and —opposition to Butler. He adopted the only method which offered a chance of success, in manfully taking the stump himself, and made, I believe, sixty-seven speeches. His gentlemanly bearing rapidly won him favor, as against the reckless lying of his opponent. The political antagonism is not less distinct than the personal. Mr. Robinson's position is substantially: "By our Constitution and laws the Governor has no power and should have no personality. If elected, I propose to be nobody." "The Governor has no more to do with the burden of taxation than a Hottentot." "I see nothing in Massachusetts which needs reform." The efforts of his supporters have been tremendous. Money has been poured out like water, and a house-to-house canvass conducted all over the State. Appeals have been published from leading business men, leading Democrats, and leading Germans. In a vote of 313,000, the largest ever cast in the State, Robinson had a plurality of about 9,000, a very dangerous symptom indeed if we follow the general idea that it is a mere struggle of property and conservatism against the mob, but very much less so if we include the issue of political principle. The maxim of the new government will doubtless be: "Draw the veil again over the internal working of our sacred institutions. The people are well served. What need is there of vexatious inquiry?" It is not the first and probably will not be the last time that the Republicans, in their utter weakness, have been saved by the folly and depravity of their opponents. They may go on in their superstitious dread of one-man power to reduce administration to a deadlock. But they can be sure that the path pointed out by Butler will not want occupants; that such a man, supported by the people, will sooner or later sweep away their delicately-contrived checks and balances—which work all one way; that they will have the one-man power whether they like it or not; and that the only choice open to them is whether they will have him strong, but responsible to the public intelligence and conscience, or whether they will have him strong, but responsible to nobody but himself. G. B.

BOSTON, November 7.

A SOJOURNER IN ALABAMA.

TO THE EDITOR OF THE NATION:

SIR: It is said of one Ovid Bolus, in 'Flush Times,' that he romanced "from a love of adventure and a fondness for fictitious narrative." I should be disposed to class your correspondent "Sojourner," writing from North Alabama, under this type, were it not too obvious that his romancing about our State and people was the direct outgrowth of malignant ignorance. His aspersions upon Alabama and her people would have fallen still-born from his pen, had not prominence and influence been given to them by publication in the *Nation*. That the Northern public may not be misled by the misrepresentations of "Sojourner," I respectfully ask for sufficient space in your columns to correct the errors referred to.

"Sojourner" says of Alabama: "I have at times seriously questioned its being a part of the civilized globe." He continues: "Perhaps nothing has so much contributed to bring about this lamentable state of affairs as the mortgage system." How passing strange is all this when the fact is that the mortgage system is precisely the same in Alabama that it is in all the other States of the Union. He says the crop-lien law —which he confuses with "the mortgage system"—was passed by our Legislature for one year, and was extended and amended until merchants could take the wagons and teams of unfortunate croppers. This is untrue. A crop-lien law was enacted by our Legislature to give parties who advanced to farmers the same lien and remedies which landlords previously had for rent. But this law only extends to bona-fide advances, to enable the farmer to make a crop the current year; and the contract could not be enforced unless the farmer signed a written instrument, stating that the advances were obtained bona fide to enable him to make a crop, and without such advances he would be unable to make a crop the present year. Our Supreme Court has decided, and every farmer knows the fact to be, that not one dollar outside of actual plantation supplies can be enforced under the crop-lien statute.

"Sojourner" says he once saw a merchant sell to a negro for $50 the iron pillar *supporting a building*, assuring Cuffie that it would protect his cabin from lightning. This absurd statement is too preposterous to be believed, even if "Sojourner" had not forgotten to tell his readers what became of the building which the pillar was supporting. The building, when the pillar was taken from under it by the negro, must have been supported by the same material from which "Sojourner" spun his romance from North Alabama—thin air. But he says that another merchant took a $5 bill from a negro, and, pretending that it was counterfeit, tore it up, and threatened the negro with prosecution; then he straightway gathered up the pieces and put them together again, and kept the money. No supporting pillar was taken out in this "fish story," and I must permit it to stand or fall under the old maxim, "Falsus in uno, falsus in omnibus."

"Sojourner" goes on to state that the negroes are each year growing poorer and poorer, and are now "moneyless and powerless." The negro had nothing when the war ended, and how is it possible that he is yearly growing poorer? Can "Sojourner" answer? If he can, then let him explain how it happened that he saw one negro give $50 for an iron post, and another give a merchant a $5 bill to tear up.

He says a law was enacted by the Legislature of Alabama prohibiting, under heavy penalty, any trade in cotton between the hours of sunrise and sunset. Again he is in error. The law he refers to simply prohibits, in certain counties, the buying of *seed cotton* at night. He next goes for the soulless landlords, who, he says, rent poor, worn-out land to negroes for thirty-five pounds of lint-cotton per acre; and he asserts that the land is actually so poor that it will not produce more than a bale of cotton to three acres. When we consider that a bale of cotton to every three acres is a good average crop, taking plantations as they come, in any country, and that a fourth of the lint-cotton—giving the tenant all the cotton-seed—is moderate rent all over the South, we see nothing but ignorance and malice left in this charge. The rent of three acres, at thirty-five pounds of lint per acre, would be 105 pounds; and, as the tenant would make a bale of cotton (a bale being 500 pounds of lint), he would pay but about one-fourth of his cotton for rent, and have all the cotton-seed.

After berating merchants and landlords, "Sojourner" falls foul of "saloon-keepers," and accuses them of swindling the negroes out of their crops. He has the advancing merchant on one side grabbing all the poor negro makes, the soulless landlord on the other taking all too, and the wicked saloon-keeper in the middle getting the lion's share. He winds up by saying that the negroes in North Alabama have all gone to work on the Government improvements at Muscle Shoals, and that the merchants have now tackled the landlords and have them tied up with mortgages. This is all sheer nonsense. The locality "Sojourner" wrote from is the most beautiful, fertile, well-cultivated, and prosperous section in the South—the Tennessee Valley: and if "Sojourner" did not meet with intelligence, hospitality, refinement, and prosperity there, it was not the fault of the country or the people, but because he struck that low stratum of society which is found in every country on the civilized globe.

Now a word for Alabama, in conclusion. There is no war of races or of sections here, and labor and capital work harmoniously together. The increase of cotton production speaks for the output of labor, and the general prosperity of the country exhibits the utilization of capital. We have uncultivated lands, and have ever had, for that matter, because the population has never been sufficient in Alabama to occupy and cultivate one-half of our broad expanse of fertile soil. But our waste places are rapidly being filled up, and emigrants from all over the civilized globe are coming in and finding homes among us. They say that they meet with hospitality and fellowship and material aid here which were unknown in the sections from which they came; and they are all highly delighted with our cheap and productive lands, our mineral deposits of coal and iron, our manufactures and industrial works, our educational advantages, our churches, and our mild and healthful climate. They come with trunks, and not "carpet-bags." Let "Sojourner" note this.

TUSCALOOSA (Alabama).

NOVEMBER 4, 1883.

THE "SENIOR SOCIETY" EVIL AT YALE.

TO THE EDITOR OF THE NATION:

SIR: I ask for some portion of your space to describe an evil which threatens danger to Yale College. I am compelled to speak through the public press because the College press is closed to discussion of this subject. I select the *Nation* as my medium of communication because by it my letter will be brought to the attention of Yale graduates more widely than by any other paper.

There are two Senior societies here, "Skull and Bones" and "Scroll and Key." Yale stands alone among colleges, I think, in having a secret-society system which is entirely a class organization; and in this peculiar feature must be sought the cause of the evils of the system. These evils have grown so great as to be injurious to the College and to call for some action on the part of those who have its interests in charge. It is useless for undergraduates to appeal to the Faculty, for half the members are society men, and it would be hard to convince them of the evil, or to persuade them to act against their societies. Therefore, I am compelled to appeal to the press to publish the evils which I am about to mention.

First, the societies have suppressed the freedom of the College press. We have here a daily paper, two bi-weeklies, and a monthly magazine, and all are controlled by the societies. Not a sentence which reflects on the societies is permitted to be printed; not a joke, not an item of news, can appear in connection with their names,

excepting the solitary case in which once a year the list of new members is published. The *Yale News* was started in 1878 as an anti-secret society paper; the *Courant* about 1876–79 was non-secret society; but the society elections come after the election of editors, and the society men took care to select a sufficient number on all the papers to insure their control. This they have done ever since. The *News*, the *Record*, the *Courant*, the *Literary Magazine* are all in the hands of the societies so completely, that when a person remarked that he regarded a certain one of them as the exponent of Yale College opinion, one of the editors replied: "Yes, it is the exponent of Yale College opinion, but as modified by the secret societies." It is easy to see what a tyranny this is when the College is divided on the society question.

Again, the evil worms itself into our religious life, it introduces friction into our religious development; for the members form cliques. The class deacons who belong to the societies associate more with their fellow-members than with the rest of the class, whereas they should be *class* officers. The society deacons, moreover, lose much of their influence in the class. This is glaringly exemplified in the present Senior class. Again, the deacons who are left out must find it rather difficult to work cordially with those whose interest lies elsewhere; and the servility towards the societies which taints the lower classes must affect their deacons. Our literary societies have been destroyed by the concentration of interest in the secret societies. They became all-absorbing, and old "Linonia," whose walls echoed in days gone by to the voices of those who are now among our nation's great men, is dead beyond resurrection. It is not true that literary societies here have been killed by the increased spread of good and cheap literature, for why has not the same cause destroyed them at Amherst, Princeton, and elsewhere?

I come now to another class of evils—the injury to the College, as such. There are several rich Yale men who have determined not to give her a dollar so long as the societies exist. The Yale Y. M. C. A. building subscription list suffered, I am told, to the extent of $1,000 from a single individual who is opposed to the societies! The loyalty of the graduates is lessened. I know of some young graduates, and my friends tell me of more, who go hence saying, "Now I am through; no more Yale for me." Many, too, have resolved that they will not urge their friends to come here. In short, the College loses money, loyalty, and numbers, all from this same cause. It is the belief of some that "Yale's conservatism" keeps donations and students from her; but it is a question with many whether it be not true that they are kept away by the societies. But I will not elaborate further. I will not speak of the personal injury to the members from "spreads," late hours, and the drinking which at least one society permits; nor of the expense to the men; nor of the hard feelings engendered between students; nor of the ridiculous customs which permit the society men to violate every rule of good manners if a person happens to mention his society to him; nor of the diminished number of students here as compared with that at Harvard, caused, as some think, by the society system; nor of the deterioration in the quality of the students' college work which, according to a former professor of Yale, comes after the society elections every year; nor of any of the other evils. Those which I have mentioned in detail are the most important.

I do not pretend to play the rôle of reformer. I state facts, and those who can may refute them. The Yale Alumni should do the reforming. They have but to investigate the matter to be convinced of the truth of these charges. The present Senior class feels deeply on the society question, and the sentiments here expressed are those of a large number of its members. In the name of '84 I call upon the Yale Alumni, the Faculty, and the Corporation, to look into this matter and reform it. The undergraduates can do nothing except agitate, and they are shut off from many legitimate ways of doing even this by the power of the societies—a power which, so far as it goes, is an absolute tyranny. For the good of Yale this system should cease to exist, or be radically changed. YALE.

THE STUDY OF GREEK.

To the Editor of The Nation:

SIR: In Professor Cooke's address upon the "Study of Greek," reprinted in the November number of the *Popular Science Monthly* (1883), is a passage which seems to require special reply. It is, that "in the classical schools the aim should be, as it always has been, literary culture, and the end should be that power of clothing thought in words which awakens thought." Standing alone, this statement might be passed over as a truism, but, taken in connection with another utterance of the speaker, it involves, I think, a grave misconception of the purpose of education. Professor Cooke further says: "For myself, I believe that the old classical culture is the best culture yet known for the literary professions, and among the literary professions I include both law and divinity." I deny that the law is a literary profession, and I deny that it is a sound principle to shape the culture of children according to the real or fancied requirements of any special profession, when it is unknown what any individual's profession will be.

It is to be always kept in mind that the discussions concerning the value of the study of Greek, as a means of mental training, are primarily concerned with the question of methods of instructing *children*—that is, of teaching that portion of the human race who have yet to learn not only what there is to be known and to be thought about, but also how to study and to think at all. Hence, back of the questions of methods lies the equally important question, What are the nature and the mental capacities of the average uninstructed child?

The vast majority of adult men and women are naturally either incapable of doing thinking of the kind which, clothed in words, "awakens thoughts in others," or they are too indolent to do such thinking. They either have to be, or are, content to accept and repeat the thoughts of others; and they either can do, or only choose to do, the limited thinking essential to their respective vocations as humble bread-winners. In the same way, children, generally, are either of limited mental capacities or constitutionally indolent. In choosing the materials and instruments for culture, the organizers of any general system must choose such as are best adapted for the mental constitutions of the greatest number of pupils, as well as for attaining the end of that culture.

Now, it is not true that the end of any kind of culture is the "power of clothing thought in words which awakens thought in others." The object of all culture is to fit the future man or woman to rightly and successfully *direct individual conduct*, in whatever may be the special calling of each in after-life. There can be no doubt, then, that the true end of all culture is to teach the future man to *think* correctly. But thinking cannot be separated from thoughts about concrete things, and, therefore, all culture, as a condition of teaching to think, must furnish concurrently the material facts upon which the pupil may exercise his powers of thought.

The study of languages most completely fills the required conditions. No one can do original thinking in any department of science who is incapable of making original investigations therein. Original investigations cannot be made by children; the utmost they can do is to observe and to remember. Hence science instruction, in early years, is merely exercising the memory and storing up facts: it involves no exercise of the mind in analysis, synthesis, deduction, or expression. By means thereof the pupil accumulates a mass of information not only useful, but in fact indispensable nowadays to intelligent conduct in any walk in life; but he gets no real exercise in "thinking." When a child is set to learning a language, the case is far different. He has not only to charge his memory with the meaning of words, their various declensions and conjugations, but, in order to translate from the foreign language into his own, and vice-versa, he is forced to reflect, to compare, to analyze, and to put together again, in order to solve the problem of the meaning of the author he is translating. He is further required to clothe the ideas so extracted by him in appropriate language of his own. In other words, he is taught both to think and to express his thoughts.

Among science studies, that of geometry is the only one which can compare with linguistic study in the above-described respects. Next to geometry comes algebra, and, last of all, arithmetic, as developed in the ordinary school text-books. Against them is their inapplicability to many minds. No children are so constituted mentally that they cannot be taught languages. The study of languages is sufficiently concrete to be within the grasp of any of the powers of abstraction of any child removed above idiocy. But even the simpler problems of geometry and numbers demand of the pupil such powers of abstraction as to be beyond the reach of many minds of otherwise excellent capacities. There is this also against mathematical as compared with linguistic studies, that they require a very limited vocabulary and the use of very bald sentences. They are inferior as instruments in training the pupil how to express his thoughts, although they are valuable auxiliaries in inculcating conciseness of expression.

Languages ought, therefore, to be the chief subjects of study, hereafter as heretofore, in all preparatory schools, notwithstanding the modern development of science. Greek should retain its place by the side of Latin in the curriculum of studies. They form together the best introduction to the acquirement of the modern languages, among which I include our mother tongue. The Greek grammar supplies the deficiencies of the Latin grammar in this respect. Both, moreover, have a practical value for the scientist and professional man.

But in thus advocating the study of Greek and Latin in preparatory schools, it is not proposed to advocate the critical study of them as generally pursued in high schools. When a child has reached that point in his knowledge of those languages that he is expected to write Greek and Latin verses, or to be able to discuss intelligently dialect idioms and differences of style among writers of different periods, then the study should stop. Who thinks of making the writing of French and German verses a part of the method of teaching the French and German languages? One who should propose this would be hooted at. In what school is *writing* verses required as a part of the study of English language? Life is limited, as Professor Cooke observes, and there must be a limit to the number of things taught. To keep a child drilling at

verbal niceties and at manufacturing verses, in any language, while allowing him to grow up in ignorance of the facts of natural science, is a perversion of culture and a violation of its true end. That end is, as we have seen, to bring the pupil to that point in the acquirement of facts, and to that degree of development of powers of thinking, which will enable him in after life to know where to look for what it is essential for him to know in his particular vocation, and how most efficiently to use the material after he has found it.

Our colleges, therefore, should continue to insist upon a knowledge of Greek and Latin as a prerequisite to entrance, but should not require any more critical knowledge than they now do of the English or other modern languages for admission. The time thus saved in the preparatory schools the colleges should require to be devoted to natural history and the sciences. A knowledge of the latter is essential to every business and professional man, and of both is indispensable to all who would lay any just claim to possessing modern culture.

Before closing, I desire briefly to vindicate the denial that the law is a literary profession, best trained for by classical schools. Professor Cooke has fallen into the common error of laymen, in supposing that the space in front of the jury-box is the lawyer's principal arena of action. Such is not the fact. The most important causes in the courts are usually chancery causes, because the most complicated. Resort to a jury is very seldom had in chancery practice. Some States dispense with juries in civil causes by agreement, even in causes at law; and in all States the weightiest causes ultimately find their way into the appellate courts, in which there are no juries. The lawyer's principal practice is, therefore, before benches of judges, who are usually extremely impassible persons. Flowery speech and impassioned eloquence are of small use in such practice. For this the lawyer needs industry, broad and general knowledge, and the ability to reason closely and to express himself with conciseness and clearness. As was said by Mr. Clarkson Potter to the graduating class of the Albany Law School in 1873, "there is hardly any knowledge, whether of science, literature, or art, that may not become of use to the lawyer."

Law governs all transactions of civilized life. Disputes arise between men in every kind of profession or avocation, which are brought at last to the lawyer's consideration. The lawyer must be fitted to comprehend the technicalities of all other occupations besides his own, in order that he may advise intelligently and prosecute or defend successfully. A mere *classical* training would be but a poor preparation for such requirements of knowledge, and a profession which involves such requirements is not merely literary. The law, as a profession, can dispense with the classical school; it cannot dispense with a knowledge of the facts of nature. Nor, do I think, can divinity.

FREDERICK G. BROMBERG.

MOBILE, Nov. 6, 1883.

THE RESOLUTIONS OF '98.

TO THE EDITOR OF THE NATION:

SIR: In the matter of the mutilated text of the Kentucky "resolutions of '98," you say as follows in the last number of the *Nation*:

"We copied from the resolution as passed by the Legislature and as given by Elliott, attested by the proper State officers ('Debates on the Constitution,' iv., 540). Mr. Welling has given the words of the original *draft* as found in Jefferson's works (vol. ix., 464). This makes unnecessary any further answer to the statement that the resolutions have often been garbled to make them sound like secessionism."

This language leaves the impression, and I must suppose was *meant* to leave the impression, that I had mistaken the original *draft* for the resolutions *as passed*. Nothing could be more erroneous, as you will see when you recall that the original draft of Mr. Jefferson was first published in 1831, whereas, of the two authorities which I cite for the unmutilated text, one was published in 1798 and the other in 1824.

When you say that you copied from the resolution as given by Elliott ('Debates on the Constitution,' iv., 540), you do not advance very far in discovering the "truth of history," for if you had quoted from the edition of 1830 ('Debates on the Constitution,' iv., 380) you would have found the text in its integrity.

JAMES C. WELLING.

WASHINGTON, Nov. 8, 1883.

[We have endeavored to gain access to the original records in the Kentucky archives. Meantime, we print the above, while repeating that we are indifferent which of the contending texts is established, so far as its bearing on the main question is concerned.—ED. NATION.]

AUTHORS AND "READERS."

TO THE EDITOR OF THE NATION:

SIR: It is the custom among publishers to send books for review, and sometimes to submit manuscripts for inspection and criticism, to specialists in the departments of literature to which the works may belong. Is there not some danger that the reviewer or critic, engaged perhaps on the same ground as that covered by the work submitted, might be led (by reason of the frailty of human nature) to endeavor to prevent anticipation of his own work by passing an unfavorable judgment upon the book or manuscript, and so keep it from publication or wide circulation? If this suggestion has not been made before, it ought to merit some slight attention from authors and publishers.

Respectfully, EDW. INGLE.

JOHNS HOPKINS UNIVERSITY, BALTIMORE, October 30, 1883.

THE SOCIETY OF AMERICAN ARTISTS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of Thursday, November 8, an article appeared concerning the "Society of American Artists." I am asked, as Secretary of the Society, to request you to kindly correct this reference. The exhibit referred to is the exhibition of sketches, studies, and unfinished work at the American Art Galleries, No. 6 East Twenty-third Street. The Society of American Artists has held several exhibitions in this gallery, but it has no connection whatever with the one above mentioned, and, while indebted to Mr. Sutton, the proprietor of the American Art Gallery, for many courtesies, it desires so far to correct your notice.

EDWIN HOWLAND BLASHFIELD, Secretary S. A. A.

58 W. FIFTY-SEVENTH STREET, NEW YORK, November 8.

Notes.

MISS YONGE'S 'Stories of American History' will be published in this country by D. Appleton & Co.

J. B. Lippincott & Co. have in press 'Our Young Folks' Josephus,' uniform with 'Our Young Folks' Plutarch.'

J. R. Osgood & Co. publish immediately 'Guenn: a Wave on the Breton Coast,' by Miss Howard, author of 'One Summer.'

For January, Ginn, Heath & Co. announce an edition of Cædmon's 'Exodus' and 'Daniel,' by Prof. T. W. Hunt, of Princeton College.

The 'Vicar of Wakefield,' with Mulready's illustrations, is the latest addition to the "Classic Series" of Roberts Brothers, Boston.

Charles Scribner's Sons join in the Luther festival by bringing out a new edition of Prof. Geo. P. Fisher's work on 'The Reformation,' originally published ten years ago, and by issuing 'The Hymns of Martin Luther, set to their original melodies, with an English version,' the joint production of the Rev. Leonard Woolsey Bacon and Nathan H. Allen. The hymns are thirty-six in number, and four of Luther's prefaces to them are reproduced in English. The book is a comely one and should be popular.

The 'Henry Irving Birthday Book,' which George Routledge & Sons have led the season with, relies for its daily texts chiefly upon the parts which this actor has taken in upwards of forty plays. These are all enumerated in a table, together with name of author and date of Mr. Irving's first appearance in them. There are also portraits of Mr. Irving as *Hamlet*, *Richard III.*, *Romeo*, *Shylock*, *Vanderdecken*, and *Charles I.*

Miss Josephine Hodgdon has made some characteristic selections from Motley's works, in the form of 'Leaflets from Standard Authors' (Harpers). The volume will serve either for private reading or for instruction in schools.

"Standard Time," now that we are on the eve of getting it, is properly the leading topic in Mr. Foster's *Monthly Reference Lists* for October (F. Leypoldt). In the carefully and authoritatively prepared series on the several Federal administrations, Monroe's is in order in the present number.

Mr. John Edmands's "Reading Notes on Luther," mentioned last week, have been reprinted in pamphlet form (Philadelphia: Grant, Faires & Rodgers).

Works printed or published by Franklin, or intimately associated with him, are catalogued as fully as may be in the Autumn Bulletin of the Boston Public Library, where will also be found another section of the invaluable Index of Articles on American Local History, carried as far as Buffalo.

A double number (9-10) of the Johns Hopkins University Studies embraces Mr. Herbert B. Adams's papers on the "Village Communities of Cape Ann and Salem" which have already seen the light in the Essex Institute's Historical Collections. One more issue, we are told (on "Local Government in South Carolina"), will complete the first series, for which a full index will be prepared. The second series will consist of monthly monographs devoted to Institutions, Economics, and Politics, and will be begun in January, 1884.

An interesting paper on the "Glacial Phenomena over the New Haven Region," by Prof. J. D. Dana, may be found in the November number of the *American Journal of Science*. It seeks to demonstrate the existence of a contemporaneous southward-flowing Connecticut Valley ice-sheet and a transverse upper flow. Other questions will be considered hereafter.

Very readable, too, is Prof. John Le Conte's first paper of "Physical Studies of Lake Tahoe," in the *Overland Monthly* for November. This remarkable body of water is very deep and exceptionally transparent, and the bodies of those who are drowned in it do not rise to the surface, sinking (as the writer explains) into a stratum too cold to permit the generation of gases.

America receives not a little attention in the double number 106-7 of the *Journal* of the Berlin Geographical Society. The leading article, by Professor Gelcich, treats of the Gascon fish-

eries in connection with the discovery of Newfoundland; but the writer, in citing in support of his views a recent work printed in Boston, overlooks its origin, and styles Mr. Charles Levi Woodbury an Englishman. Gustav Niederlein gives some scientific results—chiefly botanical and agricultural—of a journey across the southeastern pampa of the Argentine Confederation to the Rio Salado in December and January last. The region was in the main found arable and eminently fit for cotton culture. Dr. Arthur Krause contributes a scholarly monograph on the Chilcat River region in Alaska, through which the whites probably first made their way to the Yukon. A map, of his compilation, exhibits this region and indicates the passes to the latter river. In the same number of the *Journal*, W. Strecker has some destructive criticism on a theory of the route of the Ten Thousand opposed to his own (now many years before the scientific world), which hinges upon the Kolat-Dagh being the height from which the Greeks saw the sea.

The October *Portfolio* has many literary as well as pictorial attractions, Mr. Hamerton's chapter on the parks of Paris being of course conspicuous. Americans, too, have some interest in the readable paper on the Clyde, by W. Chambers Lefroy, for Robert Owen and his Lanark experiment come in for sympathetic remembrance. And is it not an American who furnishes the sketches for Mr. Vernon Lee's "San Gimignano of the Many Towers"? Chief among the etchings is decidedly that after Holbein's portrait of Sir Richard Southwell, by a lady, Mme. Louveau Rouveyre.

The ports of France receive their full share of attention in the thirty-fourth volume of *L'Art* (J. W. Bouton). Marseilles, Bordeaux, Nantes, and Rouen furnish subjects for some very interesting full-page etchings, partly topographical, partly artistic. An artistic journey in the Basque country calls for quite a different set and kind of illustrations. Related topics are treated in François Lenormant's "Principles of Ancient Art in Coins"; in the account of the medal engraver, Bertrand Andrieu (1761–1822), whose portrait on skates is a curiosity; and in the paper on the medallionists of the Renaissance. Leave is finally taken of the Pergamon sculptures. There is a discussion of Byzantine art in its influence upon the West. Serial illustrated articles are devoted to Rubens at the Munich Museum and Della Robbia; and facsimiles of studies by Claude Lorraine show this artist in his workshop. Most to be prized among the largest etchings are Rubens's "Portrait of a Savant," by Daniel Mordant; Carolus Duran's portrait of his mother; a portrait of an old woman after Franz Hals; Van Dyck's "Prince William II. of Orange and Marie Stuart"; and Pourbus's Marie de Médicis and Anne of Austria. Nearly every number of the accompanying *Courrier de l'Art* for the third quarter of the year tells of one or more statues in process of erection, as, to Daguerre, to Lafayette, etc. Apropos of the Alexandre Dumas monument by Doré, some trenchant criticism on the latter artist by Charles Monselet is quoted. Doré seemed, says this critic, to make all his personages in flourishes (*en paraphes*); he put flourishes in the beard of Abraham, the locks of Roland, and the biceps of Job. His anatomy consisted of corkscrews and shavings. A statue of Henri Regnault, in uniform of the National Guard, which adorns the front of the new Hôtel de la Ville, shows him drawing with his left hand, some people have complained. The *Courrier* explains that this is true to life.

A large number of nautical terms happen to fall in the nineteenth part of Koolman's exhaustive 'Wörterbuch der Ostfriesischen Sprache' (Norden: H. Braams). Several of these the English have borrowed from the Dutch, as, *snau*, the 'snôw' (a two-masted ship) of our colonial period, for which no certain etymology is offered, though Lat. *navis* is suggested as possible; *spake* (*spâk*), preserved in our 'hand-spike,' to the derivation of which nearly two pages are devoted; *sprêt*, 'sprit'; *stag*, 'stay'; *stander*, flag ('standard'); and *sparre* (*spar*), 'spar,' which furnishes a "coals to Newcastle" proverb in "sparren na Norwegen stüren." An equivalent of "in vino veritas" is given under *spreken*, 'to speak'—"drunken mund sprekt hartensgrund"; while a familiar English proverb is easily recognizable in the kindred Frisian form of "stille waters hebben de dêpste grunden." The present instalment of the Dictionary ends with *stippen*.

With Part 103 is concluded the seventh volume of the new edition of 'Brehm's Thierleben' (B. Westermann & Co.). The chapter on reptiles is thus closed, while that on insects begins, offering rich opportunities for color effects in the chromo plates. Those exhibiting the lizard tribe, however, have not been deficient in this respect, and in general execution have been truly admirable.

We have received the first number of *Scandinavia*, a monthly journal published in Chicago. According to the prospectus, it "will be an organ through which men of Northern Europe can address the civilized world, . . . calling attention to the national peculiarities which have developed themselves during the last fifteen centuries in Denmark, Norway, and Sweden, and in Iceland and Finland." It will also "gather and publish facts concerning the history of the Scandinavian settlement of America." *Scandinavia* presents a very attractive appearance, and we wish it success.

The announcement of the "Correspondence University" lies before us. The headquarters of this system of home instruction is at Ithaca, N. Y., Mr. Lucien A. Wait being Secretary. As the title implies, it directs study and tests proficiency by correspondence, with pass and honor examinations. The associated instructors embrace many first-rate names, a large proportion being connected with Cornell University, though several other leading institutions are represented.

A volume which came to us from the Cleveland Educational Bureau has for some time been awaiting mention. It is the second series, 1882–83, of 'Books for the People,' edited by Charles E. Bolton. Each of the ten "books" here bound together was distributed to members of the Bureau at its entertainments in a vast "tabernacle." A membership ticket, costing $1 50, entitled the holder to "ten first-class orchestra concerts, ten lecture preludes, ten lectures, concerts, and debates, and ten condensed and common-sense" pamphlets, which we have here bound together. That the members had a good time, there can, considering the musical part of the several programmes, be little doubt. That they were greatly edified by the discourses in the "books" is less clear. Mr. Talmage's "Thoughts on Evolution" occur in this series, and we cannot rate highly a "Bureau" which regards them as educational. The half-military, half-Sunday-school drill, again, to which the audience is subjected, may be thrilling to see, but, like the rest of the proceedings, suggests a purely mechanical idea of imparting knowledge.

The Librairie des Bibliophiles, to which we owe so many series of choice books, beautiful in the careful perfection of the type, and press-work, and paper, is now about to start a series of dainty octavos, to include only modern masterpieces, and to be called the "Bibliothèque Artistique Moderne" (New York: F. W. Christern). The first volumes will be the 'King of the Mountains,' by M. Edmond About, with seven etchings by M. Mougin after M. Delort, and a selection of M. Daudet's 'Contes,' with six etchings by M. Eugène Bertrand. These will be followed by the 'Théâtre d'Alfred de Musset,' with drawings by M. Louis Leloir, and by Stendhal's 'Chartreuse de Parme,' illustrated by M. Jean Paul Laurens.

A translation of Miss Alcott's 'Eight Cousins' is now appearing in the *Magasin d'Éducation et de Récréation*.

The November Atmospheric Wave has this year been unmistakably distinct. It passed over the Lakes on Sunday last, and reached Boston on Monday about noon. It always comes to stay six months. It drove before it the last remnants of summer's moisture in the shape of a violent snow-squall—a phenomenon which never occurs except between November 6 and May 6. The Indian summer which this cold wave terminates has also been very marked; the temperature of the past month having almost equalled that of August.

The report that Professor Rudolphsen had withdrawn from the Cincinnati College of Music, upon which we commented in a recent number of the *Nation*, proves to have been erroneous. Our authority was a Cincinnati despatch to the New York *Times*, which had every appearance of being authentic, and which was, we believe, based on this musician's disposition to withdraw. We regret that we were misled by it, and very gladly state, on competent authority, that Mr. Rudolphsen retains his position, and that the "Faculty as a whole may be safely compared with what it has at any time been."

—The "Harvard Annex," having completed its fourth year, the Executive Committee have at last been enabled to grant certificates to graduates, that each "has pursued a course of study equivalent in amount and quality to that for which the degree of Bachelor of Arts is conferred in Harvard College, and has passed in a satisfactory manner examinations on that course corresponding to the College examinations." Three young ladies were entitled to and received this certificate, while one other, it was certified, had "successfully pursued, through a period of four years, a course of liberal study given, under the supervision of this Society, by instructors in Harvard College." Still a third form of certificate is now given at the close of each year's studies. All three have a market value, and students pass without difficulty from the Annex to high and well-paid positions as teachers in all parts of the country. During the fourth year, as we learn from the Secretary's report, just issued, there were forty-one students, of whom Massachusetts furnished three-fourths. Twenty-five of these succeeded in obtaining the annual certificate for satisfactory work in stated courses. Twenty-three of them pursued Greek — the largest number devoted to any one study; Latin following with 22, English with 15, German with 14, mathematics with 11, history with 9, physics with 8, etc. The fund originally subscribed for this interesting experiment has now so far dwindled as to be insufficient to carry on the instruction another year; but an endowment has been sought, with encouraging success, and already the sum pledged is $67,000. Manifestly, however, a much larger sum must be raised, and we have little doubt that it will be. The report calls attention to the fact that 87 per cent. of Massachusetts teachers and 80 per cent. of New England teachers are women, and that the colleges of this section lend them almost no assistance in preparing them to fill the upper grades of instruction. We find also this remark, which seems to bear on the present undertaking

of Columbia College: "Present them [women seeking the higher education] a course of instruction different from that offered to men, and they do not eye it askance because they think it not so good, but because it is probably just out of the line upon which progress and improvement are to be expected. This is one of the reasons why thoughtful women have less confidence in courses of instruction especially prepared for them, than they have in that one upon which the wisdom of men has for generations been working and is still working."

—The scientific results of the voyage of the *Corwin* to the Arctic seas in 1881 have been published by order of Congress in a handsomely illustrated quarto. The most important paper is that of Mr. E. W. Nelson, on the birds of Bering Sea and vicinity, with four beautiful plates by Ridgeway. Owing to the absence and severe illness of the author, many serious typographical errors disfigure the text, notwithstanding which the paper is one that will not only be a standard of reference, but will attract the general reader by its easy style and interesting details of the habits of the birds described. Mr. John Muir gives some acceptable lists of plants from various localities visited by the *Corwin*, and makes some general remarks on the flora of the region. Dr. T. H. Bean contributes a list of the Arctic fishes known from north of Bering Strait, with plates of two interesting salmonoids collected by Captain Hooper. The first paper in the book is by Dr. Rosse, of the *Corwin*, consisting of his medical and anthropological notes, well seasoned by opinions, fancies, and quotations, many of which are as unscientific as irrelevant. Moreover, the multitude of obscure phrases and allusions in this paper make it hardly likely to please even the taste of the unscientific reader. It is well illustrated, but what a costly chromolithograph of two tattooed Japanese citizens in undress can have to do with the voyage of the *Corwin* is not clear, nor does the Doctor inform us. Neither is it evident why he has favored us with top views of the crania of "an eminent mathematician who committed suicide" and of "a prominent politician during the civil war," with several others. On the whole, such a twisting of the purpose for which this report was ordered printed is emphatically to be condemned.

— In Bartlett's 'Dictionary of Familiar Quotations,' Lincoln's "government of the people, by the people, for the people" is paralleled by similar phrases from earlier speeches by Theodore Parker and Daniel Webster. No original is suggested, however, for the equally famous passage from the Second Inaugural Address—"With malice toward none, with charity for all, with firmness in the right, as God gives us to see the right"; nor are we aware that any has ever been suggested. The following expression, however, bears so close a resemblance as to be worth quoting: "In charity with all mankind, bearing no malice or ill-will to any human being, and even compassionating those who hold in bondage their fellow-men—not knowing what they do." It occurs at the close of a letter addressed by John Quincy Adams on July 30, 1838, to A. Bronson, of Fall River, Mass., in response to an invitation to attend a celebration on August 1 of the final abolition of slavery in the British West Indies.

—The latest of Mr. John Croumbie Brown's contributions to forest literature is devoted to 'Finland: its Forests and Forest Management' (Edinburgh: Oliver & Boyd). The present volume will be found of more general interest to the American reader than its predecessors, treating as it does of forests not very dissimilar in natural features to those of the extreme northern portions of the Atlantic States and Canada. The following statement, quoted by Mr. Brown from a report of Doctor Ignatius, an officer in the Statistical Bureau of the Finnish Government, might, for example, have been written with equal truth about the forests of Michigan or Wisconsin:

"Forest products constitute more than half of the total value of exports from Finland. This shows of what importance the forests are for the country. These immense resources have been wasted recklessly for centuries. That apparent dislike to forests which has been seen among all settlers in forest lands seems to be innate in the Finns. The practice of setting fire to the trees in order to clear the ground has led to the destruction of forests upon a great scale, and the conflagrations have at times swept over a great extent of country."

Great improvements have been introduced into the management of these forests during the last twenty years. Forest fires have become less numerous with the gradual substitution of more sensible methods for the ancient and barbarous custom of *Svedanje* or *Sartage*—the name applied to an operation of agriculture consisting in burning off a portion of the forest and then planting with cereals the soil enriched by the ashes of the burned trees. Two, or at most three, crops are raised in this way; the field is then abandoned and allowed to grow up to wood again. This, the most primitive method of forest management, is always attended with immense destruction of property, owing to the impossibility of preventing the spread of fire beyond the limits intended, and the effect of fire upon the soil itself—a point rarely sufficiently insisted upon by writers upon forest economy. *Sartage* prevailed at one time or another in every country of Europe; it is still common in some portions of India, and has cost the United States millions of acres of its fairest forests. Indeed, in heavily-wooded countries there is no other way by which a scanty population can rescue sufficient land for tillage from the forest. It is only when the forests of a country are reduced below a point sufficient to supply its population that methods of forest perpetuation can be successfully introduced. This point was reached long ago in Europe; it is fast approaching, if it is not already reached, in this country. Mr. Brown devotes a considerable portion of this volume to an account of the lakes and rivers of Finland, including a rather disjointed and apparently unnecessary narrative of a journey to the Saima Lake, and to chapters upon the topography, geology, flora, fauna, and climate of Finland, which we shall not touch upon here. Several additional volumes of the same series, by the same hand, and treating of the forests of different European countries, the author tells us in his preface, are ready for the press.

—A new edition of Vincent and Dickson's 'Handbook to Modern Greek' has just been called for, and Geldart's 'Conversational Grammar of Modern Greek' has recently appeared. The demand for books like these is one of the evidences of increased interest in Modern Greece on the part of Englishmen and English-speaking people. Nor do the Greeks on their side lack the correct instinct to recognize that their warmest and truest friend, in all that concerns their best aspirations, both personal and national, is England. Hence their increasing desire to become masters of the English tongue, and the demand for books like Lascarides's 'English-(Ancient) Greek Lexicon,' which has recently been published by Trübner & Co., London. This Lexicon is in two neat volumes, containing together a total of 1350 pp. The mechanical execution of the book is good, and its type, though small, is distinct. A second, or Greek-English, part is announced as in preparation. The collection of materials for the dictionary has occupied Mr. Lascarides for fifteen years; the preparation of the work for the press has been intrusted to Mr. Myriantheus. The book seems to be designed especially for educated Greeks who wish to acquire the English language. It will meet their wants very well, and although a somewhat expensive book (the price is 30 shillings), will not lack purchasers among the class for which it was intended. The industry of the editors is deserving of more unqualified praise than their judgment. It would seem that neither of them possesses a familiar colloquial acquaintance with the English language. Only on this supposition can the laborious and useless definition of many obsolete words and words of the rarest occurrence be explained. What occasion was there, for instance, for the mention of such words as *Abacot, Abaisance, Abandum, Abaptiston, Abashment*, or, on another page, *Loggats, Lok, Loment, Lomp*? One who needs to know the meaning of such words as these would surely best resort to Webster or Worcester. It will be inferred from what has been said that this lexicon is very comprehensive. In fact, few words contained in Webster seem to be omitted. The definitions are ordinarily in ancient Greek, and in some cases the modern Greek equivalent is added so that some opportunity is afforded for a comparison of the classical with the Romaic vocabulary. Though the definitions are in ancient Greek, the words or phrases defined are often so entirely modern that the words used in defining them seem to take on a half-modern quality. Instance the following: *Fair-complexioned*, λευκός. *To call upon the Lord*, ἐπικαλεῖσθαι τὸν Κύριον. *I want this badly*, λίαν ἐφίημι τούτου. *I second the motion*, συνηγορῶ τὴν πρότασιν. One who runs through the long lists of Greek equivalents, very briefly but usually very correctly given, of common English words and phrases, will be impressed anew with the transparency of the meaning of Greek derivatives and compounds, and will perhaps find that his own Greek vocabulary is larger than he anticipated. That such a book as this has been called for is an interesting illustration of the vitality of the Greek language. The classical scholar who should write an essay in simple style upon any topic of the day, using the words which this vocabulary would supply, and should send his essay to the *Clio*, the well-known Greek newspaper of Trieste, might be assured that it would be entirely intelligible to most of the readers of that journal.

— Of semi-historical legends, no other is so poetically perfect, and none has been so favored by circumstances, as the familiar tale of the Emperor Friedrich Barbarossa lying buried in the Kyffhäuser till the time should come for the restoration of the Empire and a political millennium. Not only has it been for centuries the symbolic representation of the yearning for national order and unity in Germany, but its intrinsic beauty has made it popular in other lands, so that, in the shape of Rip van Winkle, it is as familiar to the American schoolboy as to the German peasant. Latterly, also, it has become one of the most popular illustrations of the theory of comparative mythology, and the legend has obtained additional charm from its apparent identification with the proscribed worship of Odin. This version has, we think, through the popularizations of Bayard Taylor and Karl Blind, acquired a firm foothold in English. The myths of a dead religion are known to linger for centuries after the definite faith is not only abandoned but forgotten, so that in the unusual interest which may well have been felt in Bar-

barossa, coupled with the wonderful fact that he never returned from a crusade, the transfer to him of the indestructible pagan myths is as plausible as it is interesting. But this theory was never universally accepted—Professor Hartwig, of Halle, tells us that he published a thesis against it as early as 1860—and it is probable that it will now be relegated to the limbo of other interesting but untenable theories advanced by some mythologists. In a late number of *Westermanns Monatshefte*, Professor Hartwig reviews the works on the subject published since his thesis, and maintains that they corroborate the views there expressed. These are (1) that the story, in its popular form and political significance, is not a survival from the Middle Age, but is as much a production of Uhland's genius, as, say, Rip van Winkle is of Irving's. Of the power of melody to make an allusion universally current we have an example in Tennyson's

> "... In the golden prime
> Of good Haroun-al-Raschid."

which could not have been more familiar had it come from the Bible or Shakspere. And Uhland's verses had more than the power of melody to recommend them—they struck and soothed a quivering chord in the heart of the German people. (2) That the story first appears in its crudest shape after the death of the Emperor Friedrich II., to whom it specially applies. The proof that the legend originated in Italy about 1300, and consequently has no connection with Scandinavian heathendom, we have not space even to summarize. It shows conclusively that Friedrich I. was not the hero, but does not, to our mind, disprove the intertwining of the actual legend with the unwritten tradition of Odin. So that, after all, Uhland may first have discovered a bit of real folklore, as well as given poetic expression to the unuttered sentiment of centuries.

—Of course nobody supposes that the good old times were entirely good, or that in the ages of faith every one was obedient to the heavenly voice There could have been no martyrs if there had been no persecutors; the very saints needed the misdeeds of their contemporaries to give them the occasion for the exercise of their virtues, and the background against which their excellence was shown. Still, if any one should have a romantic belief in mediæval perfection and be disposed to forget the reverse of the picture, it would be well for him to read 'Le registre de l'officialité de l'abbaye de Cerisy,' published by M. G. Dupont in the 'Mémoires de la Société des Antiquaires de Normandie.' The record extends, with breaks, from 1314 to 1458; it is the police gazette of three or four unimportant parishes in Normandy for a century and a half, with the addition of some ecclesiastical cases. The parish churches were continually out of repair, and the treasurers were ordered to get a lock and key to the fonts, to put the vessels in good condition, to see to the bells, to repair the roof which deluged the priest during service, to bind the service-books, to take the silver chalice out of pawn. From the frequent recurrence of such orders it seems that they were only perfunctorily attended to. Another serious evil was the immorality of the priests. The relations of the priest of Littry with a certain Thommassia were objected to at eight different times. Another priest is reported as having said one day, at the fireside: "'Pulcra neptis, oscula me,' et osculavit eam," and so forth. Then there are scenes of violence in the church, for such priests were not likely to be respected. People are fined for working on holydays and for eating meat on fast days, and for swearing—Jean Collet, for example, who gave his daughter "to the devil; not to one, but to all the devils." Cases of usury and sorcery and leprosy are investigated. Cases of assault and battery are numerous, some aggravated, and there are half-a-dozen cases of rape. As for all the infelicities which may accompany marriage, or the substitutes for marriage, they fill many pages. The impression left by the whole is that the turbulent population of these villages resembled very much the lower classes in a small manufacturing or a small seaport town of the present day.

—Bach is the corner-stone on which modern music rests, and it was therefore appropriate that the first Philharmonic concert should commence with one of his toccatas, arranged for orchestra by Esser. There seems to be a contradiction in the expression "orchestral toccata," because toccata means a piece for a keyed instrument; but the contradiction is only verbal, not æsthetic. A modern orchestral version of one of Bach's shorter compositions is always full of charm, because the variety of instrumental colors makes it easier to follow the course of each of the melodies that are combined into a polyphonic totality than when one instrument only is used. The toccata was followed by Beethoven's Fourth Symphony, concerning which nothing new is to be said. The performance was as near perfection as it could be in an acoustically defective hall; and the audience was so attentive and quiet that one could almost hear the ticking of his neighbor's watch. The third orchestral piece was Mr. A. C. Mackenzie's ballad, "La Belle Dame sans Merci," and the fourth, Berlioz's "Lear" overture. Mr. Mackenzie's ballad is a composition of more enduring value than his Scotch Rhapsody, which was played in Brooklyn a week ago. Even those who did not know that Mr. Mackenzie received his musical education in Germany, and who had not heard his rhapsody, must have anticipated that his ballad would present a thoroughly modern aspect, for his name came into great prominence last season when Carl Rosa successfully produced in London his opera "Colomba," the poem of which was prepared by Mr. Hueffer, author of 'The Music of the Future,' and Wagner's chief apostle in England. The broad, sensuous, and pathetic melody of the ballad rests on a rich harmonic basis, and moves on in that quiet, steady flow which characterizes the best modern music, and distinguishes it so favorably from the classical dance-forms, with their ever-recurring, useless cadences. The composition, as a piece of absolute music, would have been of sufficient charm to be able to dispense with a "programme." But when that programme takes the shape of a weird and beautiful poem by Keats, there is a distinct gain in having both of them, and allowing the auditor's imagination to be filled with the same images that stimulated the composer while at his work. Berlioz's "Lear" overture is not one of his best compositions. The instrumental combinations are often bizarre rather than beautiful, and there is too much of the peculiar unisono and unaccompanied doleful melody which seems to have so often haunted Berlioz. As a work of art it is totally inadequate to its grand subject. Miss Agnes Huntington, who sang pieces by Mozart, Brahms, and Rubinstein, would have made a better impression in a smaller hall and under less trying circumstances. Her voice lacks resonance, and is not under full control. Her conception, however, of the emotional and intellectual contents of her songs was correct and praiseworthy.

STEVENS'S GALLATIN.

Albert Gallatin. By John Austin Stevens. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1884.

THIS is the second Life of Albert Gallatin that has lately appeared. It is a more personal biography than that by Mr. Adams, published four years ago, written with equal impartiality of party views, while following more closely in detail the public life of its subject, and only incidentally dwelling on the political changes of his time. It is more the story of Gallatin as he influenced public affairs, and less that of public affairs as they affected him. In discarding a strict chronological treatment, and preferring to present in separate sketches the aspects of Gallatin's career as a politician, a cabinet officer, and a diplomatist, Mr. Stevens falls into some repetition, to the neglect of symmetry in narrative; but the process results in an original and highly individual portrait.

Of all the great men of our first age no one enjoys so little general fame as Albert Gallatin. Students of our history trace everywhere in it the marks of his various and vigorous services; diplomatists confess him a model negotiator, and financiers walk to-day by the light he shed over the intricacies of their science. But where is the *aura popularis* that bears up weaker and less worthy names? There are few of our public men who have touched and influenced the fortunes of the republic at so many points. None of them except Gallatin was its contemporary from the day when he aided the birth of the Union out of the wreck of the Confederation, to the day when he resisted the annexation of Texas, prescient that it was "to shake the Union to its centre." He saw Washington take the first Presidency, and Scott enter Mexico, and all the wars and treaties and territorial gains between. His official services began in 1790, and ended in 1828. They were varied in range and permanent in effect beyond those of most of the men who worked with or against him. He was a sounder financier than Hamilton, though less brilliant, preferring the basis of principle to plausible theory. In negotiations with foreign Powers he was more successful than Jay—circumstances, it is true, being more in his favor—and carried through the Treaty of Ghent by the aid of patience and shrewdness that none of his colleagues displayed. In party leadership he combined such capacities, carried to such excellence, as to place him above comparison with any rival. As a member of the great Republican triumvirate, he surpassed Jefferson in practical sense and Madison in courage.

All this of course does not entitle Gallatin to the fame or rewards that followed the great organizers of the Government who had been in arms for independence. Yet the part that Gallatin took in the second era of American State history, when the idea of progress overcame tradition and republicanism gained the ascendant, was an equal part with that of any other leader. It deserved a better recognition than the nomination in 1824 to the Vice-Presidency, converted by a party intrigue into a recommendation to withdraw. But it was always objected to Gallatin that he was a foreigner, and though the fact gave force to his larger allegiance to the Union, it lost him the special attachment of a State or a section. He was not an orator, being slow and laborious in his mental habit. His bent was essentially a scientific, not a political one. He was too honest for party intrigue, perhaps too self-contained to make sufficient allowance for human passions and interests, and their play in politics. These qualities were fatal to personal popularity. Had he reached a more conspicuous place in his own day his merits and services would have won for him the wide reputation among the general public in ours which this volume is devoted to proving that he deserved.

If he was a foreigner, Gallatin was not at all the kind of foreigner that a new and free coun-

try has any reason to be afraid of. The teachings he brought from Geneva were the very ones he could make most serviceable in the land of his adoption. Geneva was then a sort of intellectual outpost of France, sharing its tastes and activities, ultra-Protestant to the degree of liberalism, expert to acuteness in money-getting and money-saving—four Jews, the French proverb says, go to make a Genevan—complete and careful in its educational system, and ruled traditionally rather than constitutionally by a bourgeois oligarchy. In spite of his cool head and aristocratic connection, Gallatin, yielding to the fermenting spirit of the time, became disgusted with the Genevese régime, and, with a few young visionaries, secretly left his home to migrate to some new region, there to embody a Rousseau's dream of perfected humanity. After three years of wild experiment in trading speculations in Maine, teaching at Cambridge, and agency business in Richmond, he at last made a settlement and a purchase of land in West Pennsylvania. His land speculations kept him poor, and "plagued him all his life," and his freak of burying himself in the woods and throwing away his advantages of education and social position hampered and retarded his career.

His first public service was in 1789 as a member of the Convention to revise the Constitution of Pennsylvania, which was followed by his election for three successive years to the State Legislature. In 1791 a report on the fiscal affairs of the State laid the foundation of his peculiar reputation. Two years later he was chosen to represent the State in the Federal Senate, and began his term by proposing inquiry into the management of the Treasury. His official existence was therefore cut short after a few weeks by a party vote, deciding, upon the letter of the Constitution, in contradiction to its spirit, that his foreign birth disqualified him for the Senatorship. During the interval of retirement occurred the Whiskey Rebellion in Western Pennsylvania against the imposition of an excise tax, which is described in interesting detail, and Gallatin's discreet and energetic action in aiding to repress it clearly brought out. "Because he represented order" he was chosen from the district which had been the scene of trouble as Representative in Congress, and, taking his seat the following session, occupied it until he became Secretary of the Treasury in 1801. In opposition during all that period, the principal questions on which he was engaged related to constitutional construction or to the finances. The debate on the British treaty of 1796 gave full scope for powerful attacks on Federal doctrines and exposition of Republican views as to the first, and he at once took unchallenged leadership as to the last, his initial step being the creation of a standing Committee of Ways and Means, and his first object the enforcement of economy by insisting on specific appropriations. He had also the credit of embodying, in an act of great national importance, the land system of the Government, which he designed to make the foundation for a magnificent plan of internal improvements.

The occasion soon came for assuming his peculiar and permanent task. Hamilton, who left public life as Gallatin entered it in Congress, had organized the financial system of the Government upon the traditions of English experience, preserving a considerable national debt as its foundation. This amounted in 1796 to about $78,000,000, the expenditure of about $7,000,000 being nearly balanced by receipts, while taxation on a population a little over 4,000,000 was already so high as to forbid any increase. Under this necessity for careful management signs of foreign aggression arose, war with either France or England seemed imminent, and the country was driven to choose between increasing its debt and neglecting its defences. The Federalists demanded an army and navy, with an indefinite increase of debt. Gallatin and his party demanded postponement of both army and navy, till they could be had without new debt. One party was charged with neglect of national dignity and authority, safe only under a strong government; and the other with seeking the control of a force to be used in crushing democracy. When Gallatin had the power, he carried out his theory thoroughly, till the war of 1812 overthrew it and his party together. Yet the country naturally returned to his system after the war, and has consistently followed it since, repeatedly discharging its debts, and protecting its commerce, not by arms, but by the interests commerce creates. Gallatin also distinguished himself in the session of 1798 by an attack, in perhaps the best of his speeches, on the system of diplomatic intercourse and commercial treaties. The purpose was, of course, to diminish the power and patronage of the Executive, which, from the adoption of the Constitution, he had jealously opposed.

The advent of the Republican party to power brought Gallatin into the Treasury Department, and gave full scope for the display of his preeminent abilities. His cardinal principles in the management of finance were the reduction of debt, the reduction of taxation, and, as indispensable for both, the maintenance of peace. He came at once into a conflict of economies with the secretaries of the military offices of Government. His plans here met with a serious and persistent check, being first thwarted by the cost of the Algerine war. The arrangement of the details of the land system employed much of his time and care. The purchase of Louisiana also required delicate management and financial skill in providing the means. Of the constitutional authority to make this acquisition of territory Gallatin had no doubt, and when the question again came up in the case of Florida the precedent he had established was readily followed. Nor was he at all less clear as to the legality and usefulness of the United States Bank, which he quietly persisted in supporting against Jefferson's unintelligent attacks. In 1807 the Coast Survey was organized, and the plan of the Cumberland Road completed. And, to crown the whole, a grand general scheme of internal improvements was resolved on, comprising systems of canals and turnpikes reaching from Maine to Georgia, and from the seaboard to the Mississippi and the lakes. An Erie canal and a Champlain canal, with a navigable waterway around Niagara Falls, were among the projected details. The whole cost was estimated at $20,000,000—enough to build one short railroad nowadays.

For seven years success and prosperity attended the administration of his office. The Government flattered itself that a political system, purely American in all its branches, was securely established, and the national debt reduced until its extinction was in full view. Politically and financially, the theories of the Secretary and his chief seemed to have triumphed in a comprehensive permanent provision for the moral and economical development of the people. Then suddenly came a change. The last years of Jefferson's rule were as disastrous as the first had been brilliant. Domestic peace and prosperity once more depended on the will and suffered from the contests of European Powers. In quick succession came the humiliation of the capture of the *Chesapeake* by the *Leopard*, the Milan decrees, the retaliatory orders in council, the Embargo and Enforcement Acts, and the Non-Intercourse Act, with all their violent and ruinous consequences, ending in the crash of Jefferson's administration, and his retirement from all but the formal duties of his office, before its term and obligations had expired. So long as peace was preserved, Gallatin so managed affairs that the revenue sufficed to pay interest on the debt and meet the ordinary expenses of government. But the hostility of his enemies in the Senate rose and strengthened with his difficulties. The struggle on the renewal of the Bank charter became the test question between them, and when in 1811 the Senate, by the casting vote of Vice-President Clinton, denied it, Gallatin recognized that he was defeated. He retained his place during the first year of the war, vainly endeavoring to bring Congress to his views as to the methods of raising money for its expenses.

Despite his protests in council, his party in Congress deliberately abandoned every principle formerly asserted, and pressed legislation that undermined the basis of national credit. "The national bank, and the system of internal taxation, which had been scorned by Jefferson and Madison as unconstitutional, were accepted actually under Madison's administration. Gallatin's success, owing to the development and application of Hamilton's plans, was a complete vindication of the theory and practice of the Federalists, which they abhorred. Jefferson's plan of a Government issue of paper money was a higher flight into the upper atmosphere of implied powers than Hamilton ever dreamed of." This statement of our author—sweeping, but not too strong—proves how rapidly the whirligig of time had brought in its revenges.

In March, 1813, an offer of mediation having been made by the Emperor of Russia, Gallatin obtained from the President the appointment of Commissioner to St. Petersburg to conduct the negotiations, retaining his post in the Treasury however, for a year longer. The Commission, consisting of James A. Bayard, Gallatin, and John Quincy Adams, then Minister at St. Petersburg, brought the two last into an association destined, by a curious combination of circumstances, to continue during the rest of Gallatin's public life. Under the embarrassments of intrigues at court, reluctance on the part of England to accept mediation, and the Emperor's absence with his army, the summer was wasted, Gallatin receiving in October the news that the Senate had refused to confirm his appointment. After much delay and perplexity, all parties seeming to act at cross purposes, an offer of direct negotiation led to the formation of a new Commission, in which Henry Clay and Jonathan Russell were added to the original members. The place of meeting was fixed at Ghent, and Gallatin superintended the preliminaries. Discussion began in August, 1814, and was protracted until December, the English envoys, far inferior in capacity to their opponents, setting out with high demands, which they moderated from month to month, as their Government grew more eager for peace. At one time the Cabinet proposed to send Wellington to America, with power of peace or war. The Duke's answer warned them that the military situation did not authorize the exaction of concessions, and the failure of the attack on Plattsburgh coming soon after gave force to the warning, and led the Cabinet to lower its tone. The peace as concluded was Gallatin's special work and peculiar triumph. Further negotiations upon subjects left unsettled by it were carried on in England almost entirely by him.

In 1816 Gallatin accepted the mission to France, which he held for seven years, conducting important negotiations on commercial affairs with that country and the Netherlands, and with England. Again in 1826 he resumed similar duties, though of a more complicated and arduous kind, as Minister at London, em-

ploying his usual tact and patience to gain substantial advantages and to establish more friendly relations. The last act of his diplomatic life was the preparation of the argument for submission to the King of the Netherlands, arbitrating on the northeastern boundary dispute. In 1828 the long sway of the Republican party came to an end, and he then withdrew from public life, recognizing in the failure of the people to elect a President the collapse of that party. For many years after he was a political power, deeply interested in public affairs, especially in questions of finance and constitutional interpretation, and consulted as an oracle in his retirement.

Gallatin lived with and outlived so many political parties, that an outline of their rise and changes is necessarily involved in the story of his public course. As seen through the perspective of almost a century, the biographer treats them clearly, frankly, with philosophic insight and fairly impartial candor. The lesson taught, as in all free states, is that our parties, beginning with principle, have borrowed bias as well as force from their strong men; have bent to circumstances, and often ended by mutual exchange of the ground first occupied. Modern situations and seemingly new conflicts find their counterparts in the early days, and always the figures move against the cloudy background of slavery, fated from the first to spread and darken into the storm of war. The succession of these changes is richly illustrated, and the personality of those who wrought them set in strong light by the letters and other documents contained in the volumes of Gallatin's writings previously published, from which much of the material for the present biography is drawn. These records fill an important place in the series of political classics, now nearly complete, formed by the correspondence of our early statesmen.

RECENT NOVELS.

The Diothas; or, A Far Look Ahead. By Ismar Thiusen. G. P. Putnam's Sons.

A Great Treason. By Mary A. M. Hoppus. Macmillan & Co.

A Woman of Honor. By H. C. Bunner. Boston: James R. Osgood & Co.

A Struggle for Fame. By Mrs. J. H. Riddell. Harper's Franklin Square Library.

Inchbracken. By Robert Cleland. Glasgow: Wilson & McCormick.

Banned and Blessed. From the German of E. Werner, by Mrs. A. L. Wister. Philadelphia: J. B. Lippincott & Co.

The Executor. By Mrs. Alexander. [Leisure Hour Series.] Henry Holt & Co.

Belinda. By Rhoda Broughton. D. Appleton & Co.

A Castle in Spain. By James De Mille. Harper & Bros.

June. By Mrs. Forrester. Philadelphia: J. B. Lippincott & Co.

Felicitas. By Felix Dahn. Translated from the German by Mary J. Safford. Wm. S. Gottsberger.

A Woman's Reason: a Novel. By W. D. Howells. Boston: J. R. Osgood & Co.

Fortune's Fool: a Novel. By Julian Hawthorne. Boston: J. R. Osgood & Co.

Godfrey Morgan: a Californian Mystery. By Jules Verne. Translated by W. J. Gordon. Charles Scribner's Sons.

Vingt Contes Nouveaux. Par François Coppée. Paris: Lemerre; New York: F. W. Christern.

UTOPIA, in one shape or another, is a constantly recurring theme in fiction. 'The Diothas' has none of the moral interest of such a book as 'Realmah' or 'The Coming Race,' but it throws a curious light upon the conceptions of the average mind as to the future of the human race. Of moral and intellectual gain there is little said, ostensibly for the reason that it is too difficult to give distinct ideas on subjects upon which there are such wide differences of opinion. But material good, solid fleshly comforts, are the only things vividly imagined. In the world inhabited by the Diothas in the ninety-sixth century, automatic machinery will have done away with almost all work. Malleable glass, electric motors, and telephones that bring the roar of Niagara to the dinner tables of New York, are the chief blessings. There is universal cremation. The Palisades have been reduced to fertilizers, strawberries are ripe from May to October, and there are no Canada thistles. Yet it is a world not so much happier than ours, as we gather from the love-story interwoven. The "proprieties" must be more vexing than ours to ingenuous youth, for they are only whimsical. The lover is as sadly torn by jealousy as to-day, and not all the latest skill in electric motors prevents the at last united lovers from being carried over the falls of Niagara in full sight of their distracted families. Yet even this startling conclusion cannot prevent the book from being dull.

An American novel with such a title as 'A Great Treason' could only mean one thing, but the reader will find that the story of Benedict Arnold is, after all, but an episode in a long history extending from the eve of the Boston Tea Party to the end of the war. For an historical novel, it is written with unusual grace and spirit, the fortunes of a young English officer and his sister forming the thread by which the various incidents are bound together. The book may well be added to the short list we have for school-room use, of good illustrations of the Revolutionary war. Arnold is but one of many figures, though the most thrilling pages of the book could not but be the capture and death of André. The writer has a power of conception beyond her execution. She realizes the opportunity for strong and graphic painting in the portrayal of such a character as Arnold's. She can see the most critical moments of his life—"Benedict Arnold, alone and unattended, landing from the *Vulture*, and going up to the Beekman House, to tell Sir Henry Clinton that the plot had failed, and that his favorite officer was a prisoner in the hands of the enemy." But to embody in fiction such ambition, such treachery, is beyond her power. The novelists who could make of Arnold a living figure, like Scott's Claverhouse, have in our day, fortunately or unfortunately, devoted themselves to the study of their contemporaries.

'A Woman of Honor' was written from a play, or with it, in such a manner that everything leads up to two or three telling situations. Study of character, or the development of it through circumstances and incidents, is, in the nature of things, impossible, but we question if truth and even probability also have not been sacrificed to the necessities of making strong scenes. The plot turns on the old device of a lady in the wrong place. Nothing is more sure to produce a sensation upon the stage than the shutting of two utterly wrong people into the same closet. But in this story the reader has time to realize, if the audience has not, that two ladies behind the curtain, besides the old servant (whom the author apparently forgets), would make all the difference in the world when the irate husband dashes up the stairway. Hence the after-distress while the lady rests under unjust suspicion seems very useless. It is much more likely that the two ladies would have had the wit to save themselves by appearing together than that one should have kept such a dishonorable silence. Still, in that case, we admit, there would have been no part for the disinterested friend to play. The old servant, a model who gets himself up mentally as well as physically for his parts, is the only original figure in the book, which is a light affair, and, as may be inferred, very unevenly done.

Mrs. Riddell, like her own young Dawtons, "possesses the art of turning out a readable tale." Two stories, in fact, there are in 'A Struggle for Fame,' which have nothing to do with each other unless it be to serve as mutual foils. We suspect this is due to the requirements of the three-volume novel, and a pity it is, for each story suffers by the frequent interruptions. One story has a hero, the other a heroine, the corresponding figures in either case being of minor concern. Both struggle for fame in the world of literature, "that land that has no itinerary—no finger-posts—no guides. It is a lone, hapless country." Mrs. Riddell is not wont to freight her stories with an obvious moral, so that it can hardly be supposed she meant to maintain that it is harder for a woman to succeed than a man. And indeed Kelly's success is such a dubious one that women like her heroine would prefer perpetual failure. If the book is to teach any lesson, it is that no success comes speedily. The heroine's would seem to most people only one long disappointment. There is another possible phase of the matter that is worth the novelist's consideration. The women who are fortunate in their chosen pursuits are represented (we had almost said, invariably) overweighted, as in this novel, with care and sorrow; or else they give up all their personal ambitions and marry happily. We are not saying that this last is not the best of all fates, but we should like to see portrayed, what certainly sometimes exists, a woman able and successful, who is, moreover, rich in all the blessings that prosperity and love can give. Misfortune, doubtless, is a fitter subject for prose fiction, as for poetry; but we insist that the position of a woman of genius has not been fully studied till the brighter possibilities of it are shown. The story offers more than the usual number of entertaining figures. In contrast to the heroine is the lady of quality, who publishes at her own expense, or her husband's: "She can't write a bit—but she sells." And in contrast to each other are the publishers, Vassett of the old school, cautious, honest to the last fibre; and Felton, the "Cheap Jack," without a scruple: "I don't care what the — I go in for, so long as it pays."

Inchbracken itself was an estate lying near Kilrundle, a little Scotch village so far away from the world that they knew the time only from the watch of the mail-coach guard. The lady of Inchbracken, the Laird of Auchlippie, and the minister of the Free Church of Kilrundle, are all people who might have stepped out of one of Mrs. Oliphant's novels. The story is quite of her kind, not so graceful indeed, and without her power of compelling us to her illusions, but vivid in its delineations of the hard-headed, self-opinionated Scotchmen. The reader is likely to turn a second time to some of the chapters.

'Banned and Blessed' can be heartily recommended to the lovers of the old-fashioned romantic story, if any such survive. It has all the requisites, from the hereditary feud between priest and baron to the doting fidelity of the old retainer.

It is sad to see that in 'The Executor' Mrs. Alexander's hand has lost its cunning. Let us hope it is but for the moment. Her place may be only in the second rank, but she has hitherto worthily filled it. Her last book gave us the

ward as the central figure. She now reverses the situation and presents the executor. He is the blackest kind of rascal, out of that far East from which the mysterious is now drawn. It used to be Poland, then Russia. We may yet have to accept a Chinaman as the fascinating mystery of a novel. Failing to marry his ward, he proposes to dispose of her by slow poison, since he is himself the next heir. Of course she is saved by a keen-eyed and adventurous lover, for whose success the reader is not so thankful as he ought to be, simply because no amount of credulity could accept the first part of the story.

'Belinda' is an uncommonly silly story. The heroine herself is a young woman of extreme beauty, acute sensitiveness, deep emotions, and seething passions, who is nevertheless presented to the world as a monument of insensibility, with a temperature stationary at zero, and a tongue that snubs society at large, more especially ardent and charming young lovers. The difficulties which beset the path of a person so unfortunately constituted form the burden of the tale, and, though the author is guiltless of such intention, the incomparable folly of Belinda and everybody else in handling these difficulties diverts the reader amazingly. It is much more entertaining than the contemplation of Professor Forth, in whom scholarship is held up to ridicule, not with "satire keen and critical," but with an elaboration of flat pedantry and constant allusion to unpleasant personal habits. But Miss Broughton's effects are not all burlesques of her designs. She can be refreshingly funny, and the sprightly sallies of the shrewd, good-natured, coarsely-ironical Sarah almost always excite spontaneous laughter. In the range of current light literature, it would be hard to find truer sketches from nature than Sarah, her grandmother, and her dogs. Here Miss Broughton forgets to try to be wise and deep, and is genuinely trivial, genuinely worldly, almost as genuinely vulgar. And, on comparing 'Belinda' with the author's earlier productions, it will be seen that she has reached that stage of growth which recognizes self-limitations, and has confined her attempts at wisdom and profundity to occasional abstract reflections, for originating which the most spiteful of us all will not hold her responsible. She has cultivated a fine feeling for nature, too, and sets her scenes effectively. Her literary style is smoother—neither so exaggerated nor so bald as of old. Since the language offers such facilities for adverb-making, she is perhaps not to blame for seizing them, more especially as without some extraordinary specimens she would hardly recognize her work as her own.

Professor De Mille's posthumous work will neither detract from whatever reputation he may have achieved as a novelist nor add to it. It leaves him just where he has been since the publication of 'The Cryptogram,' in the position of a successful manufacturer of sensational fiction. Having chosen a division of literature which knows no law, he has escaped the unpleasant chance of being caught in the violation of the first principles of story-telling, or convicted of incapacity to follow them. The attractive title excites hopes of a delicate, fantastic romance, or of a drama of human pain and passion; but the first chapter shatters the hopes. Should the reader decide to go on, he will meet within thirty pages two extremely beautiful young women, and one perfectly so, with their charms fully catalogued. He will also make the acquaintance of their respective fiancés, and will notice that these gentlemen are prone to strong language which no false delicacy prompts them to restrain in the presence of the perfectly lovely ladies. Crowding incident upon incident, with scant ingenuity and feeble invention, the author gathers together these people with several others, in a castle, somewhere between Burgos and the French frontier. Here a grand and complete transfer of affections is accomplished, and in the end each man is married to a woman to whom, when he took the northern train from Burgos, he was not engaged. The fickleness of young love is a theme of creditable antiquity, and objection to a moderate use of it would be captious; but there is an irritating prodigality about six illustrations of faithlessness in a single novel. In the capture of a train by Carlists, the detention of foreign passengers and their final release by Don Carlos himself, Professor De Mille had the materials for a good novel. Had he given one thought to sustained plot, to development of character, or even to a desirable congruity between people and their surroundings, we might at least have had something readable.

To the literary appetite which craves strength or spice Mrs. Forrester offers as little that is palatable as Mr. De Mille. She leads the army of Englishwomen who, for money or fame, or perhaps out of pure philanthropy, depict in fiction the daily life of "society." The first half of her story narrates estrangements between June and Tom, her lover; the last half is devoted to estrangements between June and Tom, her husband. The most trivial of lovers' quarrels has a certain romantic interest, and, while we appreciate the pathos with which such episodes may be invested, we protest against almost two hundred pages of misunderstandings between a man and his wife—misunderstandings which never rise in dignity above a matrimonial squabble. In 'June,' as in most books of its class, there is a crowd of women, all pretty and all weak. There is, as usual, one man—in this instance Tom—who combines uncompromising virtue with a mental dulness amounting to intolerable stupidity. The rest of the men have a liberal desire to be wicked without the persistent will to accomplish any difficult deviltry. It is natural to suppose that some positive immorality would result from the constant association of such people in the teas and tennis, the dances and dinners, which are their only occupations in life. But the author carefully insists that this is not the case, and, to make her moral purpose clear, sows little didactic homilies plentifully throughout her narrative. The value of her very proper reflections is somewhat diminished by their isolation; the unprincipled reader soon finds out that he can skip them without losing even the thread of the dialogue. The dialogue itself is a curious exhibition of "society's" conversational talent. The scrupulous avoidance of brilliancy or depth will solace the misery of the man who has hitherto believed himself the dullest fellow in the world.

Strolling one summer evening about the suburbs of Salzburg, a student finds in a lonely wood traces of a Roman villa, and a piece of marble with the inscription,

"Hic habitat Felicit . . .
Nihil mali intret."

The stone is broken, but it is easy to make the unfinished word "Felicitas." He falls to wondering who this woman may have been whose home all evil was forbidden to enter, centuries ago, when Salzburg was the Roman city, Juvavum. Wondering, he falls asleep and dreams the story of Felicitas. She lives in the last sad days of Roman imperialism, when the chief of barbarians, Odoacer, tore the bedraggled purple from the child-emperor, Romulus Augustulus, and struck a death-blow at the Western Empire. She is the happy wife of Fulvius, the stonecutter, a young Roman colonist, who has chiselled the motto over their threshold. Her loveliness has excited the desire of a dissolute Roman tribune, Leo, whose boast is that *he* is Emperor at Juvavum. He has matured a plan for getting possession of Felicitas, and the events by which this plan is frustrated lead up to an admirably dramatic crisis. From this crisis the construction of the story is seriously defective. Almost before we have grasped the idyllic figure of Felicitas, we lose her, and not till the last chapters are we certain that the author, in his enthusiasm over the capture of Juvavum, has not forgotten her. The nature of the episodes which break the continuity of the romance shows a lapse, natural enough in this author, into the familiar field of history. Sometimes, too, he fails to sustain the delusion of the present existence of his characters—the most desirable faculty in an historical novelist, as it is the rarest. But his dramatic instinct and power are unquestionable, and his presentation of detail accurate. These qualities are certainly sufficient to command for his novels and plays more consideration than they have so far received in America. Mrs. Safford has caught Dahn's vigorous spirit, and has reproduced his simple style very fairly. Her work is, on the whole, so well done that only in occasional clumsy sentences and expressions is the foreign origin of 'Felicitas' apparent.

Mr. Howells has such a well-established reputation that every new novel of his which is published is measured by standards previously furnished by himself. Looked at in this way, 'A Woman's Reason' (the significance of the title we confess we do not understand) would fall below some of its immediate predecessors in interest and importance. It is not so striking a tale as 'A Modern Instance,' though it is in many respects pleasanter reading. It suggests the Woman question, and, like many other novels which have dealt with this knotty problem, leaves it unsolved. We say unsolved, because the matrimonial solution reached in Mr. Howells's pages is the very one barred by the question itself at the outset. An unfortunate misunderstanding, many leagues of ocean, shipwreck, and disaster effect an untoward separation of the hero and heroine; and pending the hero's return (of which the reader has throughout a comfortable prevision) the heroine, thrown upon her own resources, which soon give out, has to face the disagreeable alternative of starvation or self-support. One after another occupation she tries, beginning with art of the decorative sort, and winding up in a milliner's shop, where she earns a really feminine, if scanty, livelihood for a time. But in the end the inevitable marriage bells ring out a merry peal, and the heroine's troubles terminate in the arms of her miraculously preserved and returned lover. What new light does this throw on the Woman question? None at all, we unhesitatingly reply; and the book suffers in a certain way from appearing in the beginning to suggest a profundity of social motive which is really not to be found between its covers. The heroine is very prettily drawn, with all Mr. Howells's delicacy of appreciation. The editor is also a clever sketch, and the book is full of nice touches.

Mr. Hawthorne has shouldered his way into notice and repute as a novelist by sheer force of persistence, and may be said to constitute almost a school by himself, unless, indeed, we give "Ouida" a place in it. They resemble one another in at least one respect—they have a profound contempt for what is miscalled "realism," and a lofty enthusiasm for Romance. In fact, they hold that Romance is the only true realism, or, as Ouida neatly puts it, that the Passion-flower is not less real than the Potato. In this comparison, of course, the Potato must be taken as typifying Howells, James, Trollope, and other grovellers in and lovers of the actual, while the

blooming Passion-flower stands for the world-renowned Ouida herself. Mr. Hawthorne lately gave public notice that he, too, held to the same general views, and consequently his novels should properly be called Romances. If the secret of successful Romance writing was the concoction of improbable tales, then Mr. Hawthorne would be the greatest Romance-writer living; for his stories are improbable to a degree which baffles description. In 'Fortune's Fool' the scene is laid in England and America some forty years ago, but the characters have adventures which make the Arabian Nights seem tame. We will not spoil the reader's pleasure by describing what they are, but will merely mention the fact that for unredeemed wickedness the villain in 'Fortune's Fool' could give odds to almost any one in modern fiction, and "knock him out" in two chapters. Mr. Hawthorne has really a great deal of cleverness, but he does not write good novels, for while his aim is Romance, and while he has a good deal of ingenuity in contriving his plots, what he actually achieves is the improbable, the fantastic, the queer, and the disagreeable.

Jules Verne, in his latest story, which is rather a tale for boys than a novel, introduces his reader to strange doings on the Pacific slope and to island life on the Pacific ocean. It is hardly necessary to say that he is here thoroughly at home, for where is he not at home? He is the only living writer who describes without danger of correction the manners, customs, appearance, and peculiarities of all races and varieties of men, furnishes full descriptions of countries in which he has never been, and gains his reader's confidence by giving the impossible adventures of his heroes a theoretic basis of science, which is scientific in the sense that alchemy or astrology might be called so. When he first made his name known as a writer of fiction it was announced with a great flourish of trumpets that the singular thing about his books was that the author had never been out of France. But it would have been a much more singular thing for them to have been written if M. Verne had ever been out of France. Of his science, some Gradgrind of a critic, after a careful analysis, announced that he had discovered it not to be science at all, but an impudent farrago of mock-science, which he was palming off upon the public as facts—an exposure not in the least calculated to put M. Verne out of countenance. M. Verne's position in literature may be a doubtful one, but there can be no question that the success of his romances—consisting as they do, not merely of improbabilities, but of the impossible, the untrue, the notoriously unreal—furnishes a strong indication of the strength of the imperishable appetite of the novel-reading public for something more exciting and idealistic than the dull photography of life which, according to the cant of the day, is all the future of fiction has in store for us. Jules Verne is writing too much at present, but a great deal may be forgiven him in gratitude for the amusing extravaganzas he has turned out. He has really unusual powers as a story-teller.

The French novel does not differ more in subject and in structure from the English or American novel than the French *conte* differs from the English or American short story. There is, indeed, a far greater difference between the American short story and the English short story than there is between the American novel and the English novel. The American short story—Mr. Hale's, Mr. Cable's, Mr. Stockton's, or Mr. Bret Harte's—has at its best a certain flavor of individuality and a certain symmetry of design wholly lacking in the English short story—say Mr. James Payn's or Miss M. E. Braddon's—which more often than not impresses the reader as only a fragment or an episode of a novel. The American short story is like the French *conte* in that it is complete and perfect in itself, and in that it is difficult to imagine it as a chip from a larger work. Edgar Poe's influence is largely responsible for this, and it has been as potent in France as in this country. Of the score of *contes* which M. François Coppée has recently gathered together into a volume, perhaps half are elaborate enough in construction to be called short stories, and half are slighter, and must pass rather as sketches. But all are simple, direct, and written in a rich and noble prose, beautiful in its precision and its color. Some are touched with humor, more are tinctured with satire, many are sad and pathetic, and all are honest, healthy, manly in conception and in execution. A selection from this volume and from M. Coppée's earlier 'Contes en Prose' would make an admirable reading-book for schools.

PHILOSOPHY AND THEOLOGY.

Man as a Creative First Cause. By Rowland G. Hazard. Boston: Houghton, Mifflin & Co. 1883. Pp. 112.

The Alternative: A Study in Psychology. London and New York: Macmillan & Co. 1882. Pp. 387.

Conflict in Nature and Life: A Study of Antagonism in the Constitution of Things for the Elucidation of the Problem of Good and Evil, and the Reconciliation of Optimism and Pessimism. D. Appleton & Co. 1883. Pp. 488.

On Mr. Spencer's Unification of Knowledge. By Malcolm Guthrie. London: Trübner & Co. 1882. Pp. 476.

Natural Law in the Spiritual World. By Henry Drummond, F.K.S.E., F.G.S. James Pott. Pp. 414.

Philosophy and Christianity. Eight Lectures on the Ely Foundation of Union Theological Seminary. By Geo. S. Morris, Ph.D., Professor in Michigan University, and Lecturer in the Johns Hopkins University.

The Philosophical Basis of Theism. By Samuel Harris, D.D., LL.D., Professor of Theology at Yale College. Scribners. Pp. 564.

The Grounds of Theistic and Christian Belief. By Geo. P. Fisher, D.D., LL.D., Professor of Church History in Yale College. Scribners. 1883. Pp. 483.

THE first of these volumes contains two discourses, which are devoted to showing that within his own consciousness every man has a wide chaotic sphere of sensations, desires, feelings, etc., which it is the business of his life to reduce to order and beauty. The will is the only *real* faculty, and its every act is simply an effort, and its freedom is nothing more nor less than self-control. Our conception or imagination of things is an incipient creation of them, differing from the divine creation of matter only in degree. Ages of successful effort in the material world have prepared man for systematic ideal constructions, which are to counteract selfishness and materialism, and to be set in operation in the moral sphere of life, where man is a supreme and sole creative first cause. The creative construction, or the education in ideality, which Mr. Hazard commends especially for the young, though beset with dangers, may be so directed as to result not merely in mental gratification, for the sake of which all sciences are first pursued, but in increasing the efficiency of the intellect in its every sphere. Thus there is opened to the metaphysician a wide field of both material and ideal utility. To this end it is demonstrated that the poetic or intuitive method of seeking truth is superior, even in the lowest sphere of thought, to the prosaic, logical, or discursive. But in the former field man is not, according to our author's conception, a creative first cause, for he can be so only by conscious, volitional effort.

The alternative which gives title to the second book on our list is that man is "either a puppet, dupe, or victim of unconscious forces" (*i. e.*, instincts of the mind), which are purely corporeal—the encephalon, etc.—or else he must begin a long and rigid course of self-denying conduct to mortify the reign of instinct (or the unconscious), which now transacts nearly the whole business of life, and inaugurate the rule of will and wisdom, substituting a new man for the old, and, by adopting an ideal of character opposed to his automatic nature, becoming a true free agent. The greater part of the work which leads up to the exposure of this alternative, is an attempted reconstruction of psychology, wherein "error is sapped and truth is put in its place by a noiseless process of definition which tends to exclude an appearance of addition to knowledge," but which really eliminates inconsistencies, and clears up vast areas of experience ignored by those who reduce all mental operations to judgments. In choosing between rival hypotheses or principles we must prefer that which would cause least change in our beliefs, and should often will and act resolutely upon beliefs we theoretically doubt—as, *e. g.*, the belief in freedom of the soul, loss of faith in which would probably cause a degeneration of the race. Vigorous and suggestive as the volume is throughout, its terminology is nothing less than revolutionary—and rarely for the better. "Irabditive self-insufficients," "non-certive knowledge," "thesic affection," "quesits," "non-vacant entities," "vice sensations," "anti-paradoxic experience," "non-unitive," "inapparitional," "impluritive," "impero- and pulchro-moralness," are some of the terms which stand out more prominently in a style so quaint and individual that even commonplaces are hard to understand and must have been hard to state. The author has made a dashing and interesting tour up and down a very wide domain of thought, but it would be too much to say that—aside from the individual grouping and shading of his mental impression of the universe—he has really told us anything whatever that is at the same time new and important.

The author of 'Conflict in Nature and Life' has grouped the results of wide reading about the conception of a "necessary antagonism in the constitution of things, in consequence of which the notion of universal harmony, attainable perfection, and unmixed happiness is Utopian and illusory." During twenty years of meditation upon this theme new books have made sad havoc with his originalities, till he admits that originality can be claimed only of the *ensemble* of his work. History, religion, law, science, hygiene, are each made to deposit a goodly number of facts and opinions, and contrast and even difference are often mistaken for conflict. The author's mind moves with smoothness and decency through the wide field of popular science, often constructing a perfect mosaic of well-chosen quotations. The grouping of his impressions and facts must have been an admirable discipline for him, but it seems to us in several ways a good illustration of what philosophy is not, or at least should not be.

Mr. Guthrie tells us that his present work must be taken in connection with a former book, 'On Mr. Spencer's Formula of Evolution,' as a criticism of the general logical construction of the latter's system. The writer is, for the most part, in sympathy with Mr. Spencer's methods and results, but holds that there are such gaps

and inconsistencies in his thought as to make it anything but a true unitary system. Results of studies not yet made are wrongly anticipated, words are used in place of ideas, mysticism is made to complete explanation, the "double-aspect theory" is unintelligible—these are some of the negative, purely critical theses of our author, who confessedly does not aspire to the higher claim of positive achievement. As a whole, his two books contain the most thorough and searching revision which Mr. Spencer's writings have yet undergone, and must convince any but a blind disciple that these writings are only suggestive and stimulating and in no sense final.

Mr. Drummond surmises that "many of the laws of the spiritual world hitherto regarded as occupying an entirely separate province are simply the laws of the natural world." Lecturing week-days on natural science, and Sundays on moral and religious topics, the author found the partition wall between them gradually breaking away, and the form (though not the content) of Sunday work greatly changed thereby, till "spiritual law was enunciated in the exact terms of biology and physics," and the one region where chaos reigned became a sphere of law. Accordingly, biogenesis, degeneration, growth, death, mortification, eternal life, environment, conformity to type, and parasitism, are treated briefly, first in a natural and then in a spiritual sense, and in a way which rehabilitates many theological notions in a rather interesting and surprising way, quite at the expense, however, of the old boundary line between the natural and supernatural.

Professor Morris treats of religion and intelligence, the philosophical theory of knowledge, the absolute object of intelligence, the Biblical theory of knowledge, the absolute, the world, man, and the comparative philosophic content of Christianity. The author's standpoint is an austere Hegelism, and his volume is a somewhat loosely-woven but very readable statement of the great Master's philosophy of Christianity. It is greatly to be hoped that such a book will find a wide circle of readers among the clergy.

The last two books on our list are attempts to construe the universe, not from a personal, but from a venerable traditional standpoint, and are characterized by wide reading, of which a systematic account has been kept, a constant tendency to resolve every question into a psychological form, and (especially in the volume of Doctor Harris) almost exclusive reference, not to other theological writers or to Scripture, but to the current literature of science and philosophy. Pantheism is formally refuted, and yet nature is admitted to be "imbued with intelligible thought"; Feuerbach would be and indirectly is loudly disavowed, yet it is granted that "descent into our inmost being is ascent to God." Ultimates, absolutes, finalities are constantly assumed or vindicated, and yet it is admitted that the soul posits God somewhat as it does the external world. Both volumes, and especially the former, are the result of years of reading, meditation, and lecturing, and cannot fail to interest all concerned with the subjects they treat of; but they can satisfy no one, for opposing theories have manifestly made a far deeper impression on their authors than they are conscious of, while they quite fail to do justice to the deep and quickening new insights into the meaning of the religious and Christian life already stirring in fresher minds within their own and other churches, which will no doubt soon lift them far above the eclectic, apologetic standpoints, into a region of more positive religious thought and feeling.

It would be hard to illustrate better the utter chaos which now pervades all those studies that are directly concerned with the facts of conduct, feeling, and thought than by these fortuitously-gathered volumes. There is not only no consensus, but no very closely-meshed, well and widely reasoned unity in any of them. The facts are common to all; not one of them fails to give more or less prominence to the discussion of many of the more recently formulated psychic phenomena: but the chief difference is in fundamental and first principles. They all, however, illustrate the tendency, which a decade or two hence will be seen to be the chief characteristic of the present period of intellectual life, viz., the tendency to take a new and fresher look at the most common facts of soul-life, to come into closer quarters with the thoughts men oftenest think, the acts they oftenest do, and the emotions they oftenest feel; to study objectively the actual growth of our faculties from childhood to age, and to analyze down to their neural basis those instinctive automatic elements whose activity makes up so much of life, and which are somehow so closely bound up with the nature of our highest intuitions. This is the common postulate or desideratum, more or less consciously, of each one of these books, and such work takes us back of the current definitions of mental faculties and functions so commonly assumed as data.

Nights with Uncle Remus: Myths and Legends of the Old Plantation. By Joel Chandler Harris. Boston: J. R. Osgood & Co. 1883.

Mr. Harris's reputation was made at a single stroke by his 'Uncle Remus: His Songs and his Sayings,' which appeared just three years ago in book form. It was then seen that, in spite of his disclaimer that he was simply a chronicler of negro folk-lore, he was an exquisite humorist, whose mastery of the negro dialect and skill as a story-teller placed him in the front rank of American writers. He now comes forward with a second volume, no longer a medley, but wholly given up to the "creetur" tales which made the first so enjoyable and so valuable, and thus proves the sincerity of his protest that he was a man with a mission. The mine of which he first fairly revealed the richness has, meantime, been still further opened up by his own explorations and the help of friends, until in addition to the thirty-four of the former series we have seventy-one new tales placed before us. It cannot be supposed that the vein is worked out, even if it should seem that the best ore lay on the surface. Opinions will differ as to whether there is anything in the present collection to be preferred, say, to the "Tar Baby," the explanation of Brer Possum's love of peace, or the trial of strength in which Brer Tarrypin surpasses Brer B'ar. But in all other respects, unquestionably, this work more than holds its own, and indeed, regard being had to the literary skill displayed in setting so large a number of stories, must be thought an extraordinary *tour de force*.

The ease and confidence with which Mr. Harris handles his materials are shown in various ways. There is a certain development in the two leading characters "The little boy" is felt to be getting older and more mature; Uncle Remus grows more mellow, and his finer traits are brought out by contrast with an aged "Affiky" man, Daddy Jack, from the rice plantations, and with two of the women house servants. These three new-comers all relieve Uncle Remus in telling stories, and Mr. Harris's crowning art lies in maintaining the peculiar speech and psychic quality of each. In other words, he drives a dialectic four-in-hand with unrivalled dexterity. Nothing could be better here than the way in which Daddy Jack takes a tale away from Uncle Remus and proceeds to tell it himself, but the former will not father it, and quietly resumes (p. 207): "Now, den, we er got ter go 'way back behime dish yer yallergater doin's w'at Brer Jack bin mixin' us up wid. Ef I makes no mistakes wid my 'membrence, de place wharbouts I lef' off wuz whar Brer Rabbit had so many p'intments fer ter keep out der way er de t'er creeturs dat he 'gun ter feel monst'ous humblyfied." Another striking example is a succession of three variants of one theme, told by Uncle Remus, Daddy Jack, and Aunt Tempy respectively. Space fails us, however, to quote freely from these laughable pages. How many delicate touches there are like this (p. 99): "Brer Wolf he keep on, he did, twel he done stop up de hole good, *en den he bresh de trash off'n his cloze*, en put out fer home." Or take this consummate piece of deception and anti-climax (p. 71): "Brer Rabbit say he a good frien' to Brer Fox, en he aint got no room ter talk 'bout 'im, but yit w'en he see 'im 'stroyin' King Deer goats, en chunkin' at his chickens, *en rattlin' on de palin's fer ter make de dog bark*, he bleedz ter come lay de case 'fo' de fambly."

Our author has had compassion on his Northern readers, and adds many helpful foot-notes in explanation of the obscurer terms, besides furnishing a special Daddy Jack vocabulary. His introduction gives an interesting account of the difficulties of gathering his later stories, which are still current, and he makes the acute criticism on Theal's 'Kaffir Folk-Lore' that the fact of these tales having all "undergone a thorough revision by a circle of natives" raises a fair presumption that they were more or less cooked, and that the body of Kaffir folk-lore corresponding to that of the Southern States has still to be extracted from reluctant informants. However, Theal supplies some curious parallels with the stories related by Mr. Harris; and so does Bleek, but the Kaffir hare (*hlakanyana*) has already given way to the Hottentot fox. It is also made nearly certain that the Amazonian tortoise-myths recorded by the late Professor Hartt were derived by the Indians from contact with the blacks. The same thing has happened to our American Indians. The introduction concludes with a rhymed Creole animal story lately published by Prof. James A. Harrison, of Washington and Lee University.

We cannot dismiss this work without noticing its confirmation of Mr. Harris's capacity for higher and more sustained efforts, as already evidenced in 'At Teague Poteet's.' His accurate and sympathetic observation, his poetic imagination, his strength and tenderness in character drawing, a certain dramatic instinct, moreover, show that he may yet make a name in fiction as in folk-lore. His publishers, we are glad to see, announce as in preparation 'Mingo, and Other Sketches.'

Italy. By Ugo Balzani. [Early Chroniclers of Europe.] London: Society for Promoting Christian Knowledge; New York: E. & J. B. Young & Co. 1 vol. 8vo.

From the title one may suppose this to be a dry book, giving an account of the Italian chroniclers of the Middle Ages; but Signor Balzani has made of it a most learned, interesting, and at times picturesque narrative of the early chroniclers of Italian history from Cassiodorus and Gregory the Great to Albertus Mussatus, Dino Compagni, and Giovanni Villani. Beginning with the fall of the Roman Empire he passes them all in review, giving, when possible, their lives and works, with translations of remarkable passages in their books, and succinct comments on their style and trustworthiness; the whole seeming an epitome of the history of that long, dark period,

yet so condensed in form as to occupy only 340 pages. The book begins with the Gothic invasion chronicled by Cassiodorus, and still more by his compiler, the Goth Jordanes, whose 'Compendium of the History of the Goths by Cassiodorus'—the original of which is lost—is the best account we have of that warlike nation. The other writers follow till the fifteenth century, when Italian history began, superficial still, but destined soon to shine in the pages of Macchiavelli and Guicciardini.

The most important chronicler to whom we are indebted for what we know about the Lombards is a Lombard himself, Paulus Warnefridus, commonly styled Paulus Diaconus, who wrote the 'Historia Longobardorum,' and of whom Signor Balzani speaks at length. After him there are only monastic books from which to make incidental historical extracts—such as the 'Liber Pontificalis,' the 'Acts' of the Neapolitan bishops, the 'Constructio' and 'Destructio' of Farfa and of Montecassino, and the polemical religious writings of the eighth and ninth centuries—till we reach Liutprand, Bishop of Cremona, in the tenth. His life and works are fully described, for he was an actor as well as a chronicler of that eventful period of the Saxon Othos, of King Berengarius and Queen Walla, of the Alberics and the famous Marozia in Rome. Among the quotations from his chronicles there is an excellent description of the deposition of Pope John XII., in which Liutprand took part as Bishop of Cremona.

In the intellectual movement of the eleventh and twelfth centuries and the revival of ecclesiastical and historical culture which succeed this period, Montecassino and its monastic students and chroniclers take a prominent place. There figure such men as Gregory of Catino, Leo Ostiensis, Petrus Diaconus, Bruno of Segni, Petrus Pisanus, Pandulph, and the Englishman Cardinal Boso, who was chamberlain to the only English Pope who ever filled the Roman See, Adrian IV. (Nicholas Breakspear), and many others. Remarkable among these are Peter Damiani, whom Dante immortalized ('Par.,' xxi., v. 106), and Bonizo, appointed by Gregory VII. Bishop of Sutri. The latter was most prominent in the political strife between the Papacy and the Empire, and a trusty counsellor both of the Pope and the famous Countess Matilda of Tuscany. He was very intimate with the principal personages in the renowned episode of Canossa (A. D. 1077), of which he was not an eyewitness, but which he chronicles just as he must have heard of it from them. Signor Balzani has translated this passage, and Bismarck's famous saying, "We will not go to Canossa," so often repeated in the late controversy between Germany and the Pope, will perhaps justify our giving a portion of the narrative:

". . . In the meantime the venerable Gregory, for the sake of peace, was journeying toward Augsburg under great difficulties, for there was then raging a most severe winter. But the King, little heeding the sacrament, entered Italy. And some say that he desired to seize on the Pope unexpectedly, which seems probable enough; for Gregory, the Bishop of Vercelli, his chancellor, who was commanded by the princes to conduct the Pope over the Alps, when he had crossed the Apennines, heard that he (Henry) had secretly entered the city of Vercelli, and told the Pope of this, who then went to Canossa, a strong fortress of the most excellent Matilda.

"Meanwhile, the King, seeing his machinations discovered, laying aside, as it seemed, all fierceness and putting on a dove-like simplicity, goes to Canossa, and for some days remaining barefoot on the snow and ice, deceives all the less cautious, and receives from the venerable Gregory the absolution which he craved in the sacrament during the celebration of the Mass, in the following manner: For he made him partake of the holy table in the presence of the bishops, abbots, monks, priests, and laity in this manner, that if he humiliated himself in spirit as in body, and believed that the Pope was the rightful one, and that he had been excommunicated on account of his imitating Photius and Dioscorus, and believed that he could be absolved by this sacrament, then might it be given him for his salvation; but if otherwise, might Satan enter into him, as into Judas, by his mouth. What else? During the celebration of the Mass they took the communion together. Then it is commanded to all who are absolved from excommunication that they should keep aloof from the society of the excommunicated. But there are some who say that he swore to the Pope by his life and limbs and honor; I, however, will affirm nothing of which I am quite ignorant.

"Then the King, after he had been absolved from the ban, seemed in appearance sufficiently devoted and obedient to the Pope; for he separated himself from the society of all those bishops, considering them to be excommunicated [those bishops who had elected the anti-pope Guibert], agreeing, however, at night in all their wicked plans, and resolving that in his mind which afterward was made clear by the result of the matter. And so he acted all the time that he remained at Piacenza, fearing especially the presence of his mother, the most religious Empress, who happened to be there.

"At the same time that Cencius, hateful to God, whom we have mentioned above, came to him, whom in the daytime he refused to see as being excommunicated, but at night gave himself wholly up to his pestilent counsels; and when he saw that the Pope could in no way be torn from the fortress of Canossa, he went to Pavia."

The book is neatly printed, and worthy of a place in all libraries.

Recollections of a Drummer-Boy. By Harry M. Kieffer, late of the 150th Regiment Pennsylvania Volunteers. Illustrated. Boston: J. R. Osgood & Co. 1883.

It needs some genius to convey an adequate idea of a mode of life to one unaccustomed to it. Familiarity with army life seemed to take away from most actors in it the power of judging what of its features were distinctive and would be of interest to the men of peace at home. In the book before us ample space is given to the hunting of a squirrel, in no essential differing from the frolic of a boy nutting in October, and a terrier is described at length as an interesting member of the regiment. The practical jokes of the camp, and witticisms equally obsolete, are rather flat when rehearsed without their original setting of occasion and scene. When physical comforts were so few their importance was great; and among the most interesting chapters are those giving the different ingenious shifts of which necessity was the mother. The various rude kinds of huts for winter quarters which grew to be so comfortable and homelike are fully described, and recipes are given for disguising hard tack which seem equally simple and unattractive. Only a short list appears of the many tortures, more or less mild, invented for the discipline of offenders, and perhaps it is as well that it is no longer, unless some idea could be given at the same time of the danger other men were placed in by the offences, and of the irritation produced by stubbornness and insolence. Still, too little is said of the minor details of a life where a man's hope for a luxurious night's sleep lay in coming to an understanding with some comrade, and clubbing and sharing blankets with him; and where one of the perils of the night was having the camp-fire run through the grass and burn your bed and yourself. Due honor is paid to the savoriness of raw pork, which was gladly eaten with the sauce of hunger and with serene disregard of trichinæ. Words would probably fail to describe the condition when water was unbesitatingly drunk from the ruts in the road, or the luxury of fresh meat or green food after long want of them.

The book does not deal at all with strategy, and in the description of battles presents mostly the scenes at the rear, and what might naturally fall under the observation of a drummer-boy. There is little idea conveyed of a soldier's familiar experience of the eager intentness with which an advance of skirmishers is watched, the thrill that follows the first shot, the bustle and hurry of guns coming into battery, the double-quick of supports, the rapid formation of line, and the sudden breaking out of heavy musketry announcing the beginning of serious work. Some of the challenges of sentinels and answers incorporated in the text would indicate that the 150th Pennsylvania Volunteers were not over-punctilious in conforming to the army regulations on such points, but the regiment is represented as everywhere bearing itself bravely, and doing credit to the service to which it belonged.

Many memories will be revived by this narrative. The long, weary waiting to be reviewed by the President, relieved, in the instance selected, by the welcome, dashing arrival of Master Tad on a pony, calling out, "Make way, men! Make way, men! Father's a-coming! father's a-coming!"—the senseless double-quick for the tired men at the close, with the regular flop-flop of cartridge-boxes and bayonet-scabbards; picket duty when the feeling was angry, and sharpshooting constant and determined; and also when the reverse was true, and an informal truce was negotiated under the protection of a piece of white paper, and boasts of prowess were good-naturedly exchanged, and tobacco and coffee bartered, till some command or disagreement led to a tame resumption of hostilities—are all referred to. One of the latter occasions furnishes an admirably true sketch from the pencil of a Confederate soldier, the appearance of which in such a book is in itself an agreeable illustration of how thoroughly the war is over. The story of the raising of nine-months' men in a quiet town, and the war fever running through all the young men, seems taken from the life, and will probably in all its essentials be enacted over again, with little change, in the next war we may be unlucky enough to engage in.

Handbook of Dates. Arranged Alphabetically and Chronologically. Compiled by Henry Clinton Brown. A. Lovell & Co. 1883.

An "Introduction," so called, by W. W. Newton, of Pittsfield, Mass., tells us that this compilation is the work of a "young friend," engaged on it "during his college vacation." The student undertook the labor for himself, and as the fruit of a vacation (or two) it is creditable enough; but at Mr. Newton's "urgent request," he "concluded to have his labors published"—without having made the necessary studies, and probably without the necessary time for a careful revision. Haste in execution marks the whole, from beginning to end, though the author seems to have been inspired by an earnest desire to do a good piece of literary work. We read in the chronological part: "145 Antonius [*sic* for Antoninus] defeats the Moors. . . . 146. . . . Artemidorus. 147 Apuleius. 148 Justin the historian. 149 Aulus Gellius the grammarian. 151 Maximus Tirius [*sic* for Tyrius]. . . . 153 Pausanias. . . . 158 Lucian." We ask, who were Antonius, Artemidorus, Apuleius, Maximus, Pausanias, Lucian? What did Artemidorus and the rest do, or what happened to them, in the years stated? The alphabetical part totally forgets Artemidorus, Justin, Gellius, and Maximus, repeats the sentence about "Antonius," and tells us that Apuleius "lived, 147," Pausanias "lived, 153," and Lucian was "born, about 135"—that is all. We are told in what years Cain and Seth were

born; what ages Methuselah and Noah reached; when Memnon the Egyptian invented letters, and when Ogyges began to reign; but we look in vain in the whole book for such names as Spinoza, Franklin, Kant, Kossuth, or Bismarck. The chronology of the American civil war is rich in names of battles, but there is nowhere a mention of such commanders in it as Beauregard, McClellan, Jackson, Meade, Sheridan, or Farragut. Grant is not mentioned before 1864, and Lee not before 1865. We find the "battles" of Dug Spring (1861) and Nachod (1866; twice misprinted Nachos), and also a "battle of Engen, May 3, 1880" (in the alphabetical part), which we are unfortunately unable to locate; but the names Ostrolenka, Buda, Metz, Plevna, and Shipka are as little discoverable as Bem, Görgei, Bazaine, Osman Pasha, or Skobeleff. The Polish struggle of 1830-31 is told in this one sentence: "Insurrection in Poland suppressed"—under "1830," when it broke out; the Hungarian revolution in these words: "1848 . . . Revolution in Hungary," and "1849 . . . Revolution in Hungary put down"; the Franco-German war of 1870-71 in a few blundering sentences; and the late Russo-Turkish conflict in the two following: "1877 . . . Russia declares war against Turkey," and "1878 . . . Negotiations between Russia and Turkey for peace begun," the conclusion of peace in the latter year being ignored. The alphabetical part knows no Mazzini, Garibaldi, Pius IX., or Victor Emanuel; leaves Louis Napoleon unelected, uncrowned, and uncaptured, and knows William I. only as King of Prussia. The chronological order within each year is not observed, as in the following: "1871 . . . An armistice February 28; meeting of the Assembly at Bordeaux"—a meeting which took place before the armistice. All these inaccuracies and omissions are only samples, and yet the book is not beneath criticism, and the author may be expected to do much better work in future.

Examples for Elementary Practice in Delineation. Designed for the use of schools and isolated beginners. By Charles H. Moore, Instructor in Drawing and Principles of Design in Harvard University. Boston: Houghton, Mifflin & Co.

LAST year we had the pleasure of praising Mr. Moore's 'Facsimiles of Examples in Delineation,' for pupils somewhat advanced in drawing, and we then expressed the hope that he would publish a primary work, which is now before us. Taken together, these two volumes furnish the best course of instruction now available in the conditions which the author had in mind, namely, those of solitary students, and of classes in which it is more convenient to copy from line drawings than from natural objects. For these conditions Mr. Moore's method is as judicious as can be imagined, and his latest examples cannot fail, if mastered, to lead to that precise command of simple lines which is the prerequisite of taking up the higher work. They consist, after some preliminary geometric training, largely of leaf forms, which any competent teacher can multiply if needful; then come some architectural outlines, Grecian, Egyptian, Italian; Egyptian and Assyrian designs; ornamental letters; finally, a head after Botticelli—in all, twenty plates. The text calls attention to the notable points of beauty, character, or difficulty in them, and for the rest is well calculated to imbue the teacher with Mr. Moore's high ideal. We shall expect the best results from the wide introduction of these drawing-books. If their function were simple exclusion of the prevailing ones, it would be useful enough.

Modern French Readings. Edited by William I. Knapp, Street Professor of Modern Languages in Yale College. Boston: Ginn, Heath & Co. 1883.

THIS neatly-printed volume of 457 pages contains only eleven selections, taken from the works of but seven authors. Mr. Knapp's reasons for giving a few long pieces in preference to a large number of short ones—to wit, that "only in that case can the full range of the writer's mind be discerned and enjoyed," and that "time and space are allowed him to overcome the awkwardness of the début, to settle comfortably in his theme, and exhibit the power he may have to draw us with him"—are certainly good, if the object of the reader be to gauge the depth of the author's mind; and in that case care should be taken that the selections be made from his best compositions, else we do him injustice. But Mr. Knapp also informs us that, his object being to furnish the student with "progressive materials for becoming acquainted with the current language of France under the influences that are giving it a new phase of development," the selections have been made principally "with reference to style and vocabulary." Would it not, then, have been more to the purpose if the 152 pages occupied by Victor Hugo's "Ruy Blas" had been filled with half-a-dozen complete short stories by prose writers such as Edmond About, Cherbuliez, Monselet, Claretie, and other living authors, whose style of writing is as modern as may be desired—withal polished, elegant, natural, and free from the taint of the "realistic" vocabulary with which Zola and his consorts have tried to give the French language "a new phase of development"? "Ruy Blas" is a very fine drama in verse—one of the *chefs-d'œuvre* of the Romantic school of 1830-40; but it is scarcely a fair specimen of the "current language" of the present time. The first piece—a touching story by that ancient "friend of childhood," Berquin—although a very good model of simplicity in style, is a singular choice, so soon followed as it is by selections from such vigorous modern writers as Guizot, Dumas, Gautier, Daudet, and Hugo. Moral tales by modern authors are not wanting from which a selection might have been made. The elder Dumas's 'Beefsteak d'Ours' is a lively story in the author's earlier manner. The "Grand Amœur," to whom the French are just now erecting a statue, has written many a better story, but the embarrassment of choosing is only the greater for this abundance.

Although we may find fault with Mr. Knapp's selections as a model of "progressive" reading, for the reasons set forth, yet we hasten to add that the pieces, in themselves, are unobjectionable, and form an entertaining course of reading, very suitable for an advanced class of students. The clear and full definitions of the French idioms and difficult constructions, which are to be found in the notes at the end of the volume, give additional value to the book.

BOOKS OF THE WEEK.

Arius the Libyan: An Idyl of the Primitive Church. D. Appleton & Co.
Art, L'. Vol. 34. J. W. Bouton.
Ayres, A. The English Grammar of William Cobbett. D. Appleton & Co. $1.
Belot, Adolphe. The Stranglers of Paris. Philadelphia: T. B. Peterson & Bros. 75 cents.
Berthelot, M. P. E. Lectures on Explosive Materials. D. Van Nostrand. 50 cents.
Boot, W. H. J. Trees, and How to Paint Them in Water Colors. Cassell & Co. $2 50.
Brine, Mary D. Jingles and Joys for Wee Boys and Girls. Cassell & Co. $1 50.
Champney, Lizzie W. Three Vassar Girls in England. Boston: Estes & Lauriat. $1 50.
Coan, T. M. Art and Literature. G. P. Putnam's Sons. 60 cents.
Green, Anna Katherine. Hand and Ring. G. P. Putnam's Sons. $1 50.
Harland, Marion. Judith: a Chronicle of Old Virginia. Fords, Howard & Hulbert. $1 50.
Harper's Young People. 1883.
Harris, J. C. Nights with Uncle Remus: Myths and Legends of the Old Plantation. Boston: J. R. Osgood & Co. $2.
Hart, M. C. The Amateur Printer; or, Type-setting at Home. Dick & Fitzgerald.
Hays, Mrs. W. J. A Loving Sister: a Story for Big Girls. Thomas Whittaker. $1.
Herrick, Sophie Bledsoe. The Wonders of Plant Life under the Microscope. G. P. Putnam's Sons. $1 50.
Hoyt, Rev. W. Gleams from Paul's Prison; or, Studies for the Daily Life in the Epistle to the Philippians. Ward & Drummond. $1.
Hubbard, L. L. Woods and Lakes of Maine: a Trip from Moosehead Lake to New Brunswick in a Birch-Bark Canoe. Illustrated. Boston: J. R. Osgood & Co.
Hudson, Rev. H. N. Shakespeare's Merchant of Venice. For Use in Schools and Classes. Boston: Ginn, Heath & Co. 25 cents.
Janet, P. The Theory of Morals. Charles Scribner's Sons. $2 50.
Lee, Margaret. The Story of a Story. Ward & Drummond. $1 25.
Little Folks: a Magazine for the Young. New and enlarged Series. Cassell & Co. $1 25.
Locker, F. Poems. White, Stokes & Allen. $1.
McCosh, Rev. J. Certitude, Providence, and Prayer. Charles Scribner's Sons.
Mitchell, Lucy M. A History of Ancient Sculpture. With numerous Illustrations. Dodd, Mead & Co.
Molinos, M. Thoughts from his Spiritual Guide. Chas. Scribner's Sons. $1 25.
Moore, C. H. Examples for Elementary Practice in Delineation. Boston: Houghton, Mifflin & Co. $2.
Moulton, Louise Chandler. Firelight Stories. With Illustrations. Boston: Roberts Bros.
Nordhoff, C. God and the Future Life: The Reasonableness of Christianity. Harper & Bros.
Pancoast, S. The Kabbala; or, The True Science of Light. With a Chapter on Light in the Vegetable Kingdom. R. Worthington.
Perkins, C. C. Historical Handbook of Italian Sculpture. Charles Scribner's Sons. $4.
Poe, E. A. The Raven. Illustrated. E. P. Dutton & Co. $1 50.
Proctor, R. A. Draw Poker. Principles and Chance Laws. Dick & Fitzgerald.
Pulpit Prayers by Eminent Preachers. A. C. Armstrong & Son. $1 50.
Rein, Dr. W. The Life of Martin Luther. Funk & Wagnalls. 25 cents.
Ridley, M. L. The Three Chums. Thomas Whittaker. $1.
Ruenzler, F. German Manual: a New Method for Acquiring a Theoretical and Practical Knowledge of the German Language. 2 vols. Henry Holt & Co.
Ruskin, J. The Art of England. Oxford Lectures. John Wiley & Sons. $1.
Saunders, J. A Noble Life: a Novel. Harper's Franklin Square Library. 20 cents.
Schaff, Prof. P. A Popular Commentary on the New Testament. Illustrations and maps. In 4 vols. Vol. iv. Charles Scribner's Sons. $5.
Schaff, Prof. P. History of the Christian Church. New edition, revised and enlarged. Vol. ii. Ante-Nicene Christianity. A. D. 1-325. Charles Scribner's Sons. $4.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 22, 1883.

The Week.

***For the first time in eighteen years the *Nation* is compelled to offer its subscribers a paper of less than the stipulated size and the customary variety. A sudden and unreasonable strike in the newspaper offices of this city has temporarily involved our own journal in its crippling effects. We feel assured of the forbearance of our readers.

NOTHING has shown the "power" of the press more clearly than the success of the Washington correspondents in working up a canvass of the Speakership several weeks in advance of the meeting of Congress. With only twenty Congressmen in Washington, the correspondents have been able to publish every day for a week exhaustive canvasses of the field, giving the exact strength of each candidate and the probabilities of his success or failure. They have succeeded also in inducing the leading candidates to define their "views" and set forth their claims for election. This was skilfully brought about by first interviewing the single candidate who was in Washington, and then hunting down the other candidates in their turn to see what they had to say about the first candidate's assertions. The greatest success has been scored with Mr. Randall. He talked several columns with reporters who visited him at his Pennsylvania home on Thursday; defined his attitude on nearly all public questions, and closed with the interesting intelligence that he proposed to dine that day on a turkey that was born on his place, and to fortify the repast with vegetables which he grew himself. Mr. Cox is less talkative on the question of principles, being in fact too much annoyed by the general refusal to take his candidacy seriously, to speak calmly on few other subjects. His predicament is precisely that to which all habitual humorists are liable. Their most serious efforts are always in danger of being interpreted as their very best jokes.

The controlling issue in the speakership contest is the very simple one: "Shall the tariff question be discussed or dodged?" If a majority of the Democratic members conclude that it will be the best policy to suppress all debate on the subject, Mr. Randall will be elected. If a majority conclude that the party can take the risk of reopening the question, Mr. Carlisle or Mr. Cox will probably be chosen. Other issues are discussed by the various candidates at great length, but it is evident that they will have only an indirect influence in deciding the result. Mr. Randall's strength lies almost wholly in his attitude as an opponent of all tariff agitation. He has been from the first the one candidate who, both by disposition and experience, is best qualified to suppress impolitic debate. It is understood that if elected he will construct the committees in the interest of the no-agitation policy, and will use all the power of his position to prevent anything like a free-trade demonstration. He has taken pains to define his views at great length recently, and has advanced the grotesque idea of disposing of the tariff trouble by referring it to another commission. He has also reasserted his devotion to "tariff for revenue with incidental protection," and has taken the trouble to fortify his position with an elaborate array of citations from dead Democratic statesmen, in order to give the formula the aspect of a "time-honored" Democratic principle. He adheres to his plan, advocated by him in the Ohio campaign, of cutting down the surplus by abolishing the taxes on whiskey and tobacco. On this point he stands almost alone among Democratic statesmen.

Of the other candidates, Mr. Carlisle represents the most direct antagonism to Mr Randall. He is in favor of an unrestricted tariff discussion, with the ultimate object of reducing existing duties and preparing the way for free trade. His advocates make more or less effective efforts to disguise the purposes of his candidacy, but its real aim is undoubtedly as we have stated it. He is opposed to abolishing the whiskey and tobacco taxes, as all the Southern members are, declaring that what the country wants is not "cheaper whiskey and dearer blankets," but "cheaper blankets." Mr. Cox stands between Mr. Randall and Mr. Carlisle, and favors a judicious admixture of the policies represented by both. He says the country demands a reduction of the surplus, and that the only proper way to secure that reduction is to cut down the heavy duties. He opposes the abolition of the whiskey and tobacco taxes, which he favored in the last Congress, and opposes the policy of trying to save the party by suppressing debate. He thinks the Speaker "should be simply the modest organ of the House—to execute the rules," and that it is high time that the great commercial city of New York had a representative in the Speaker's chair. "I have not," he says modestly, "the wily reserve of the Pennsylvanian, or the wary prudence of the Kentuckian, but I have a record of a quarter of a century of parliamentary practice, of undisputed probity and democracy." For some inscrutable reason, he failed to add that he enjoyed also the devoted friendship of John Kelly. There appears to be no doubt that Mr. Randall's prospects are much the best of the three candidates.

The stories set afloat from time to time about "Arthur's chances" for 1884 do not seem to be based on any special effort yet made by the President to secure his own nomination, but to come almost altogether from a belief that he might get it if he chose to exert himself, and that there is no other candidate now before the country who seems to be "developing strength." It is contrary to all the traditions of American politics that a Vice-President who gets the Presidency by an accident should afterward become President; but then this case is a peculiar one, different from any which has occurred before. Arthur has got all the benefit from the political interregnum which has lasted ever since Garfield's death—the sort of political apathy which has made it impossible to go back to the politics of the Grant, Blaine, and Conkling period, and which has failed to raise any new issues in such a way that parties can divide upon them, and can either hate or love and admire politicians for raising them or making them plain. Nobody hates the Administration, or feels like denouncing it, so that negatively it may almost be said to be a strong Administration. But what puts it in a different position from any accidental administration that has preceded it is the curious condition of the South. There is not a single Southern State which the Republicans have any reasonable chance of carrying next year, yet there is in every one of them a Republican organization which will send a full delegation to the National Convention, whose votes would, if combined with a few Northern votes, be sufficient to control the nomination.

Those who regard Mr. Arthur as the most formidable Republican candidate for the succession, apparently count on a Republican solid South in the Convention, just as the Democrats count on a Democratic solid South in the election. Their idea is that if the President were to let it be known that he was a candidate, the instinct of self-preservation would "rally" all these rotten Southern organizations round him, because to them the preservation of the *status quo* in politics is at least far better than anything else that is likely to happen. A real reform President is probably what they most dread. That such a forecast of the future should take the fancy of Northern politicians shows strongly what a hold the rotten-borough idea has taken of their minds. Twice the President has "let it be known" who his candidate was, once in New York, once in Virginia, and with what a result! The nominations went right enough in both cases, and both were rotten-borough nominations. But it ended with the nominations. No wonder that it should be a favorite idea with the Democrats that in a little while the President will put himself forward as the Administration candidate for 1884. The difficulty is that the very notion of an Administration candidate implies the perpetuation of every abuse to the reform of which the Administration is pledged.

Mahone has issued a long explanation of his defeat. He gives a very good account of the Readjuster position with regard to the public debt, but the best point in it is that whatever the Readjuster position may be the Funder, posi

tion is no better. In fact, on this point he has the Bourbons on the hip, owing to their recent acceptance of his financial programme. Indeed, as matters now stand, it makes little difference to the public credit which of them is in power. People of the North are not interested by any means in having the Bourbons triumph. What they are interested in is having the Readjusters defeated, because their defeat means the failure to set up the boss system in the Southern States. His story of the occurrence at Danville, which he calls "a massacre," and the Bourbons call "a riot," recalls very strikingly the state of things some ten years ago in some other Southern States. There is a quarrel between a negro and a white; then a panic, real or sham, among the whites; then an armed gathering of whites; then an attack on the blacks or a panic among the blacks, who of course always get the worst of it. But nobody who remembers the outrage stories of ten years ago will take Mahone's picture of the Danville trouble at all literally. His peroration is somewhat comic; he says the Readjuster party "has enlarged with its age and growth. It originated in an issue local and to some extent unpopular. With time and the changing issues which time brings, it has widened its sphere." What this means is, that its original object was the simple one of cheating the public creditor. The plan of adding on to this work the support of "human rights, liberty, peace and manhood," is a curious attempt to embellish dishonesty.

The testimony before the *Proteus* Court of Inquiry grows worse instead of better for all persons in any way responsible for the last arctic expedition. A more wretchedly mismanaged enterprise it would be difficult to imagine. In his testimony on Monday, Commander Wildes, of the *Yantic*, brought this out more clearly than ever. Of the two ships which comprised the expedition, the *Proteus* was the only one which was at all fitted for navigating arctic seas. But the *Proteus* was a foreign ship, officered and manned by foreigners, and furnished with a crew who not only knew nothing of arctic navigation, but were not even seamen. They were made up of "longshoremen", "beach-combers" and anybody who was willing to go. The second ship, the *Yantic*, was in every way unfit for the cruise, was taken on three days' notice from the West Indies and sent to Greenland, with a supply of provisions inadequate for a crew which was unnecessarily large, and with boilers in such a condition that they had to be patched on the way. Commander Wildes says it was an "expedition of landsmen sent upon a service which required a knowledge of how to live either upon land or water, or upon the ice as well"; that it was sent without any careful consideration of the experiences of previous arctic expeditions; that, in fact, a "great and important enterprise had been undertaken with insufficent and scanty means." The inqury may result in ahowing that the Secretary of the Navy and the head of the Signal Service were not primarily responsible for all this, but the drift of all the testimony thus far has been directly against them.

The rural pulpit of Connecticut is assuming an outspoken vigor against individual shortcomings which is having a stirring influence upon the congregations. A Hebron minister preached a tremendous sermon, a few weeks ago, on the general subject of "Mormonism," but really aimed at a prominent member of the Church who had been divorced from three wives and was at that moment sitting under the droppings of the sanctuary beside the fourth. To add to the embarrassment of the situation, wife number three was also present, and was seated where she could fix a stony eye upon her former husband and see him writhe under the "rebuke." He was so incensed by the sermon that he brought suit against the minister for defamation of character, placing the damages at $5,000. He called a meeting of the church and denounced his pastor as a liar and a hypocrite, but the sentiment of the church and the community ran so strongly against him that he sold his house and land, abandoned his suit for damages, and left the town. Emboldened by this success, the pastor of another church in the same town, who had long suffered from the somnolent propensities of his congregation, denounced them roundly as "blockheads," and said they had no more expression in their faces while in church than so many wooden images. He has also had a great success, for there is an amount of animation in his church now which is far greater than he had expected or desired

---

The Chippewa Indians threaten to make war upon the United States, and have presented an "ultimatum." The trouble is caused by the erection of dams at the headwaters of the Mississippi, which the Indians say will ruin their principal source of livelihood—by driving the whitefish from their usual spawning grounds. A commission has awarded them $15,000 as damages, but the Indians want $250,000 every six months, or $500,000 a year, a sum representing a capital of $10,000,000—which looks as if the Indians had been studying up the *Alabama* case and the Halifax fisheries award. They have, it is said, retained the services of a half-breed lawyer, and threaten to pull down the dams if their demand is not complied with. Captain Blakeley, who was sent to treat with them, inquired of the Indians how much rice and hay they gathered annually—treating the white-fish question as irrelevant; but they refused to go into this, and declared that they had "estimated their damages," and that was enough. The case shows an interesting progress among the Chippewas in the power to grasp legal ideas, and to get the white man's notions about property and "claims." A legal consultation among red men with their "counsel" over the probable loss of tribal income through the whitefish having to change their spawning ground, and the proper rule of damages to apply to such a case, shows that they have reached a stage of development beyond anything noticed among Indians since the days of the Six Nations.

The Supreme Court has rendered a salutary and wholesome insurance decision, which all who are fond of indulging a taste for assault and battery should study with care. The policy in the case was to be void if the insured should die "in or in consequence of the violation of the laws." The insured and his brother attacked one Berdell, and the assault seems to have been a very unfair one, for the brother held Berdell while the insured beat him on the head and face with a rawhide. In the course of the struggle which ensued Berdell drew a pistol, and, as so often happens in such cases, it "went off," the ball striking the insured in the head. He died afterward, and in the suit on his policy it was urged that under such circumstances the company was liable. Berdell, of course, swore that the discharge of the pistol was accidental, and the theory of the lawyers seems to have been that this made the death merely the result of a deplorable accident, which might happen to any gentleman. The jury below and the court above, however, took a different view of the matter.

The Nolls and Arnolds, neighbors in Clay County, Mo., had some trouble two or three days ago about a pathway through a field on Arnold's farm. Noll liked to use the pathway, and old Arnold objected, which finally made it necessary for Noll to shoot him dead. The affair would have ended here for the moment had not Noll perceived young Arnold approaching with a double-barrelled shot-gun. This made it necessary to kill him too, which he did with a well-aimed shot. The gloom in Clay County over this sad event is, however, so deep that there is talk of lynching Noll, who now lies in jail, which shows that it is much more effective than such gloom usually is.

Mayor's Edson's nominations for the police justices are not as bad as they might be, but they are pretty bad. There were, we believe, scores of men of high character and standing, members of the bar, available for the office, which in this city, as in any great city, can hardly be surpassed for importance. Instead of choosing any of them, he has taken two of the regular Tammany politicians, one a Fire Commissioner, and the other the Water Purveyor in the Department of Public Works. The testimonials which these men have received as to their fitness for the police justiceship simply affirm the goodness of their character. Nobody pretends that they have any special qualification, either moral or intellectual, for a judicial office. The sole reason for taking them out of the places they now fill, and for which their experience, if nothing else, fits them, is that Kelly wishes it. So that the Mayor has inflicted damage on the city in three several ways—first, by making his nominations for a judicial office under the dictation of a corrupt demagogue; secondly, by putting men in places for which they have neither natural nor acquired fitness, and thirdly, by taking men out of places of which they have had experience, and which they fill in a competent

manner. A mayor who had to face the public on his own responsibility would not venture to do these things, if he were a man of any character at all. Mayor Edson does them because he is able to shelter himself behind what is humorously called "the legislative branch" of the City Government—the Aldermen. He can always say, when he makes a bad nomination that it is the best he can get the Aldermen to accept.

The public indignation over the matter has been undoubtedly moderated by the prevailing general expectation that he would do something far worse, by filling one of the vacancies with the notorious Croker, commonly called "Dick" Croker, now a Coroner, one of the most disreputable of the Tammany "heelers," who was tried for an election murder in 1874, but escaped through an equal division of the jury. This plan of putting a good face on something outrageous by threatening beforehand something much more outrageous, is generally very successful, and in city politics may fairly be considered invaluable, and we advise Mayor Edson to stick to it. It must be said, in excuse for him, however, that Croker was strongly urged upon him by many reputable citizens. Among Croker's backers, in fact, to our amazement, as well as that of the community generally, we have no doubt, appears Mr. Abram S. Hewitt. A letter of his to the Mayor, written last year, which he has confirmed this year, has been published, recommending Croker for a police justiceship, mainly, if not wholly, on the ground that he (Croker) did not commit a murder in 1874, but did "confront a band of ruffians" at the polls. But then it is very odd that "coolness and courage and love of justice" displayed in a street fight should lead Mr. Hewitt to suppose that a man of Croker's antecedents would fill a judicial office "to the satisfaction of the public."

The moral influence of the special Grand Jury, which has not yet really begun its work, was felt again last week, when Judge Cowing carried consternation among the liquor dealers by announcing that he was tired of punishing violators of the excise laws with light fines, and that hereafter he should impose such penalties as would secure the enforcement of the laws. He began at once by sentencing several offenders to from 30 to 60 days' imprisonment. "Billy" McGlory's case was called, but was postponed on request of his counsel, who said he desired to prove through the testimony of a could not prove it then, because the ex-scientific expert, that the liquors which "Billy" has been selling are not intoxicating, but he pert was out of town. This testimony will be awaited with interest. How the quality of liquors which have been consumed, can be tested weeks after they have disappeared, is something of a mystery, but the court will probably be asked to take "Billy's" word for it that the liquors he has on hand are of the same brands as those which he has been selling.

The Democratic contest over the United States Senatorship in Ohio is likely to be an extremely bitter one. There are many candidates in the field now, but the divisions are likely to be mainly into "old" and "new" Democrats. The new Democrats are said to be favoring Henry B. Payne, of Cleveland, who is suspected of being Mr. Tilden's choice. The old Democrats favor Durbin Ward, and some of them, curiously enough, favor Pendleton's re-election, although his civil service reform record is directly antagonistic to their theories of government. One of these old Democrats says he and his companions distrust Mr. Payne, because when the war came on he turned a cold shoulder "to those who kept the Democratic house open." He thinks that the better men of the party are those "who endured the taunts and flings of Republicans when it took nerve to be a Democrat." This is probably as accurate a description as could be given of a genuine old Democrat.

The refusal of the Lord Mayor to let Doctor Stoecker lecture in the Mansion House appears to be a great mistake. Stoecker's performances in Germany as a Jew-baiter were undoubtedly very discreditable, but, after all, nothing helps even a disreputable agitator in our time more than refusing him the use of a "hall." One of the peculiarities of popular feeling in this democratic age is a tendency either to sympathize with a man who is compelled to "shut up," or to suspect that he has something very valuable to say. So that by merely seeming to wish to stop the mouth of the most pestilent fellow, it is easy to convert him into a martyr. Stoecker is said to have no charms whatever as a lecturer, and the lecture he has delivered in England appears to have been a failure, so that refusing him the Mansion House was really simply an advertisement. The Lord Mayor's disapproval nowadays hurts nobody.

The *Boston Advertiser* has a contributor, the author, we believe, of the curious rigmarole, in the shape of a criticism of Matthew Arnold's views of American society, which it published a year ago, and to whom Mr. Arnold is an object of special and national dislike. It allowed him some days ago to publish another very brutal attack on Mr. Arnold, which charged him with having made an engagement with Mr. D'Oyly Carte, rather than with any lecture bureaus of this country; with having followed his manager (Mr. Carte's) advice as to the subject of his lectures; with having come to this country simply to make money by exhibiting himself, and without having made any proper preparation of what he is going to say — hinting that the lecture on "Numbers" was written on the way out, and that Mr. Arnold had "managed" to write a new introduction to his lecture on "Science and Literature" since his arrival, and was now at work on a lecture of Emerson. The object of this sloppy malignity was, of course, to present Mr. Arnold to the American public in a light of a mercenary adventurer, exhibiting his contempt for his audiences by offering them hastily and carelessly produced wares. It now appears, as a matter of fact, that all these charges are false; that Mr. Arnold's lecturing is under the charge of the Redpath Lyceum Bureau; that in the arrangement between Mr. Carte and Mr. Arnold everything connected with the subjects of the lectures, and their number, is left to the discretion of Mr. Arnold; that the lecture on "Numbers" and that on "Science and Literature," were finished and in type before Mr. Arnold left England, and that the lecture on Emerson was completed some time ago.

O'Donnell's trial for the murder of Carey, the informer, begins next week, and the arrangements for getting him clear of the capital charge are said to be very good. A large amount, more, it is said, than is necessary, has been raised for the defence, among the Irish here and at home—a fact which is the most curious part of the whole affair. If O'Donnell did not kill Carey wilfully, or knowing him to be Carey, it is difficult to see why he should be an object of interest to the Irish people, any more than any other man who commits manslaughter in a quarrel on shipboard, or why a national or racial subscription should be raised for his defence. If, however, he did kill Carey wilfully, knowing him to be Carey, he is guilty of the offence with which he is charged. In fact, it is the belief that he is guilty that makes him so interesting; so that the defence is a very muddled affair. A similar muddle appears in the case of the families of the Phœnix Park murderers. Large sums have been raised for the families of those who pleaded not guilty, and it is said they are now living in greater comfort than ever before, but nothing has been done for the families of those who pleaded guilty, although they were just as good murderers as the others. This seems rather hard. It is the murder which gave all of them their claim to popular gratitude, and to punish the families of some because they acknowledged the exploit, seems the height of irrationality. Surely, on any sound principle of distributing honors or rewards, the memory of a murderer who confesses, is to be held in greater reverence than that of a murderer who is ashamed of his work, and tries to hide it.

The German Crown Prince is going to Spain to return the King's visit to Berlin, and it is reported that the French Radicals are busily making arrangements to have him insulted in Madrid and elsewhere by the Spanish Republicans, or else to get up an *émeute* of some kind, so as to show that the Spaniards can be as ill-behaved as the French, and that the cordial feeling between Germany and Spain is in reality only a court affair. They are not unlikely to succeed in bringing about something unpleasant, but the Crown Prince will take it probably much more phlegmatically than Alfonso took his insults in Paris. The worst feature in the affair now probably is the continued cultivation by the French of small spitefulness toward the Germans as a mode of expressing national hostility. Germans are again exposed to insult or violence in the streets, and have to be very unobtrusive to escape unpleasantness.

TRADE-UNION MORALITY.

THE experience of the working of the Trade Unions through which the *Evening Post* is just now passing has considerable public interest, because it furnishes, we fear, a striking illustration of the thoroughly anti-social principles on which many of these organizations are managed. Against trade unions as means of enabling labor to measure its strength fairly with capital, and protect itself against capital in case of difference of opinion either about wages or methods, we should be the last to say a word. We have always held that to talk of the laborer as a free agent in his negotiations with the capitalist, unless he had a labor organization at his back, was a mockery. In all contests between labor and capital the capitalist can bide his time; the laborer, unless in combination with other laborers, cannot do so. So that we consider the existence of well-managed trade unions as really a good sign of the times, as regards the future of the working classes. But in saying all this we assume that the management of them will be sober, rational, and business-like, that is, will respect the rules of morality which constitute the social bond in a civilized industrial community. In other words, we assume that the conscience of the best members of the Union will be the conscience of the Union itself, and that the members will not cause or permit to be done, by the organization, things which they, as individuals, would shrink from, or be ashamed of, and which, if done by men in general in the ordinary transactions of life, would reduce us to barbarism.

Now, as an illustration of our meaning, let us tell the story of our own dealings with a Trade Union during the past week, and we commend it to the attention of everybody, in whatever walk of life, who is interested in the solution of what is called the labor problem. The compositors of the *Evening Post* have been for many years a picked body of men. Some of them have been in its employment more than twenty years; one or two retired lately who had served it for a still longer period. When the *Nation* was consolidated with it, it carried to it some compositors who were not only picked men, but who would stand high in any body of carefully picked men. The whole company was one with whom, in short, it was a pleasure to deal, owing to the skill, intelligence, fidelity, and self-respect of its members, and there was every reason for believing that they were well satisfied with their position. Within a few weeks they asked for an advance of wages. The managers of the paper denied that this demand was, in the present state of the market, justifiable. The discussion which followed was everything that could be desired. It was both friendly and temperate in tone, and was conducted, on behalf of the compositors, by a committee who would be a credit to any deliberative body. When, finally, the point of irreconcilable difference of opinion was reached, the controversy was brought to an end with expressions of mutual respect and good will. A strike, the compositors said, would take place, but the managers of the paper would have seasonable notice of it, and it would be simply a friendly trial of strength.

At this point, the strikers apparently lost the control of the conflict and it passed into the hands of the Union. Now, observe what followed. The compositors did not give the employers the notice which they had promised, and which every honorable man, standing by himself, feels bound to give of any act of his which will disappoint the reasonable expectations of a fellow-man, or is likely to cause him loss or trouble, and which every employer, who is not utterly heartless and unscrupulous, feels bound to give to any one who has served him long, and has been guilty of no misconduct. On the contrary, they came to the office on Friday morning as usual, apparently prepared to do the work of the day. At half-past eight, when but four hours remained for the printing of the paper, they marched out of the composing-room without a word of warning—the best of them, as well as the worst. This hour was, of course, chosen in the expectation that the proprietors would be so much shaken by the prospect of having to suspend publication for that day that they would at once surrender without further struggle. The conduct of the operations was now in the hands of the chief of the Union—a lawyer, we believe, and not a printer at all—and his first trick had failed. The *Evening Post* strikers had vanished, and a new variety of labor-champions appeared on the scene as the agents of the Union. The *Evening Post* advertised for fresh hands, and a number appeared on Saturday and were employed. But, along with them, these agents of the Union worked their way in, on false pretences, and proceeded not only to discourage or seduce the new comers, but to intimidate them by threats of violence when they left the building in the evening. They, moreover, wasted the morning hour by sham composition, by making "pi" of the type, and creating disorder in the office. Some of them had to be expelled; others went of their own accord, but not before they had accomplished their object by seriously hindering the work of producing the paper.

On Monday the same tactics on a greater scale were resorted to. Knowing that there would probably be a large number of bona-fide applications for employment in answer to our advertisements, a band of Unionists appeared at an early hour and literally lied their way into the composing-room. They were asked many questions by way of testing their good faith, and every answer was an unblushing falsehood. By taking possession of the cases and making a display of sham diligence, they caused other applicants to be sent away. In two hours, when the morning was well advanced, on receiving a signal from a confederate who had likewise lied his way in, fourteen of them pocketed, or, strictly speaking, stole their composing-sticks and left the office, feeling sure, doubtless, that their fraud had made the issue of the paper that day impossible. In the meantime, a picket stationed on the sidewalk passed the day intimidating or trying to cajole all persons whom they saw approaching the office in search of employment, thus calling for constant watchfulness on the part of the police. We have no space for the repulsive task of describing the other devices by which they have sought to bring the *Evening Post* to terms. Suffice it to say that they were those with which the burglar or sneak-thief pursues his calling. In other words, the friendly trial of strength in the market with respectable, intelligent, and self-respecting men, which we were promised, had resolved itself into a series of tricks usually resorted to only by criminals, and for the perpetration of which a class of men was chosen by this highly skilled and unusually well educated trade, but little superior, apparently, to the roughs who make the strikes of long-shoremen or hod-carriers often so dangerous to public peace.

We have been assured that the decent men who left the service of the *Evening Post* are not responsible for these things, and are ashamed of them. Ashamed of them they may well be, but responsible for them they certainly are. Any one who voluntarily surrenders his liberty to a man or organization, and permits such man or organization to control his conduct in the ordinary business of life, is answerable, in the forum of morals, at all events, for the use his master makes of his power. The disgrace of it and guilt of it are his, as well as the master's. No majority vote can save him, or whitewash him. And workingmen may rest assured that as long as the methods of Trade Unions are criminal and anti-social they will not permanently or considerably improve their condition. These methods may now and then extort a temporary and small rise in wages, but more than this they cannot do. They cannot raise the laborer in the social scale. There is, in this world, no future for either force or fraud. If they had nothing else to fight against, they would be foiled by the social instinct of the race, which, in the long run and on the whole, reserves the good things of this life for those who tell the truth, respect their contracts, and do as they would be done by.

PARTY PROSPECTS FOR 1884.

UNLESS there is a great change of some sort during the next six months the two great parties of the country will enter upon the next presidential contest with very evenly balanced chances of success. The elections of this year, as we have had occasion to say, resulted in giving neither party any decided advantage for next year. This fact is made clearly apparent by an examination of the States in reference to their votes in the Electoral College. Under the new apportionment there will be 401 electoral votes in 1884, against 369 in 1880, and 201 will be necessary for an election. If the States were to vote next year as they did in 1880 the Republican candidate would receive 228 votes and the Democratic 173. But it is extremely doubtful if they will vote in that way. The total of 228 includes the votes of New York, Indiana and Connecticut, all of which have been carried by the Democrats since 1880, and all of which are doubtful States in every election. Indiana is more likely to go Democratic in a presidential election than Republican, and New York is as likely to go

one way as the other. Taking out the 57 electoral votes of these three States, the "sure" Republican States remaining have an aggregate of 171 votes. The Democrats, on the other hand can reckon surely upon the solid South with 153 votes, and upon New Jersey with nine, giving them as a starting force 162 votes. The division of "sure" States will stand as follows:

Republican.	*Votes.*	*Democratic.*	*Votes.*
Colorado	3	Alabama	10
Illinois	22	Arkansas	7
Iowa	13	Delaware	3
Kansas	9	Florida	4
Maine	6	Georgia	12
Massachusetts	14	Kentucky	13
Michigan	13	Louisiana	8
Minnesota	7	Maryland	8
Nebraska	5	Mississippi	9
New Hampshire	4	Missouri	16
Ohio	23	New Jersey	9
Oregon	3	North Carolina	11
Pennsylvania	30	South Carolina	9
Rhode Island	4	Tennessee	12
Vermont	4	Texas	13
Wisconsin	11	Virginia	12
		West Virginia	6
Total	171	Total	162

This leaves the Republicans 30 votes short of a majority and the Democrats 39 votes short, with the following doubtful States to fight for:

California	8	Nevada	3
Connecticut	6	New York	36
Indiana	15		
		Total	68

The important part which New York's 36 votes will play in the problem is brought out clearly by this showing. With New York the Republicans can elect their candidate and have six votes to spare. Without New York they must carry Indiana, Connecticut, California and Nevada or be defeated. The Democrats can win by carrying New York and Nevada, or New York and any one of the other doubtful States; but all the doubtful States except New York combined would leave them seven votes short of a majority. Indiana and California are more likely to go Democratic than Republican, while Connecticut and Nevada are more likely to go Republican than Democratic. The chief object of both parties will therefore be to carry New York, as the candidate who loses it will stand extremely small chance of election.

There are many obvious advantages in having this State as the deciding factor in a Presidential election. Its voters are more intelligent and fearless in their independence than those of any other State, and can be trusted more implicitly to decide a national contest on its merits than those of any other. Neither party, as we have repeatedly pointed out, can hope to carry New York unless it has a candidate and represents principles which will command the support of the independent voters. The knowledge of this fact will have an important influence upon the deliberations of both national conventions, and make them more careful in their work than they would otherwise be. Mahone's overthrow has had one good effect, at least, in removing all possibility of a contest in any Southern State next year. Nobody wants to see another Presidential election end in that way; and few of us care to see a "money campaign" in Indiana made the turning point again.

With New York as the battle-ground there would be a chance for a rational campaign in which important public questions would be discussed in a sane way. It would not need to be a campaign of money. The recent election demonstrated that money is of little real influence here. For the first time in many years no assessments were made, and only a small fund, raised by voluntary contributions, was expended. The old "workers" were very sarcastic before election about the feeble contributions, and spoke contemptuously of the "gilt-edged reformers," who were unwilling the office-holders should pay anything, and equally unwilling to pay anything themselves. Since the election, nothing of this kind has been heard. The politicians themselves have discovered that a good cause is a far more powerful influence than a big campaign fund.

STOCKHOLDERS' RIGHTS IN "CAPTURED" RAILROADS.

THE New Hampshire Supreme Court recently decided a case (Pearson v. Concord Railroad Company) of much interest to railroad directors and stockholders, and nowhere of more interest (in connection with the pending Elevated Railroad litigation) than in this city. The facts of the case, stated very briefly, were that the directors of two railroads connecting with the Concord Railroad Company purchased a majority of the stock of the latter, and made themselves directors of it, for the purpose of making contracts with the Concord company more favorable to their companies than existing contracts. They accomplished this object. There was not actual fraud in the transaction, but it was an instance of what was no doubt regarded among railroad men as a fair and lawful capture of the Concord road by roads which needed it as an outlet for the business of their own roads. However, it was effected in a very obvious way through the purchase of several thousand shares of Concord stock, at a price far in excess of its market value. By this means the directors of the connecting roads obtained control, and then made themselves directors of the Concord road, and made with themselves very favorable terms as to through-business. A stockholder of the Concord company, who had not sold out his interest, and who was not satisfied with this operation, brought a suit in equity against all the corporations and parties concerned, to have these contracts declared null and void. The court of last resort has now decided that this must be done, and, more than this, has applied a remedy which, if not novel in principle, is new and important in its relation to the protection of the minority stockholders of "captured" roads.

The judges held first, as has so often been held before, that the directors were trustees or agents for the whole body of the Concord stockholders; then, that as such they were wholly incapacitated from making contracts with themselves; that it made no difference whether such contracts were fair or unfair, fraudulent or *bona fide*, beneficial to the corporation or the reverse; that being in a position in which their duty to others and their interest had a tendency to conflict, they were absolutely debarred and incapacitated from acting. Other courts, they admitted, had reached a different conclusion. Some had permitted inquiry to be made into the good faith of such transactions; but the best authorities had laid down the simple principles as stated by the Court of Appeals of this State (Duncomb v. R. R. Co., 814, N. Y. 190.) The rule is founded in the known weakness of human nature, and the peril of permitting any sort of collision between the personal interests of the individual and his duties as trustee in his fiduciary character, or, as expressed by the Supreme Court of the United States, in a recent decision: "The two positions impose different obligations, and their union would at once raise a conflict between interest and duty, and, constituted as humanity is, in the majority of cases duty would be overborne in the struggle" (Crandle v. R. R. Co., 103, U. S., 651.)

The Court declares that the relation of the two connecting roads with the "captured" company was practically that of buyer and seller. They wanted to purchase of the Concord company the transportation of freight and passengers over that road. The latter wanted to sell the transportation over its own line of the traffic of the Connecticut roads. It was for the interest of those to procure the lowest rates, "and their directors were bound to use the knowledge they had derived from the confidence reposed in them as directors to attain that result, and the intent of the Concord road was to procure the highest rates, and its directors were bound to use their special knowledge for the advantage of that road. Their interests being conflicting, it was impossible for common directors to procure the lowest rates for one party and highest rates for the other."

In other words, the directors had placed themselves in a position in which they could not make transportation contracts between these companies. For the performance of their other duties as directors they were not incapacitated, but in this respect they were legally and morally paralyzed. The Court, therefore, announced that to protect the stockholders of the captured road, they could appoint a trustee to manage all those affairs of the Concord road which the directors had made themselves legally incapable of managing.

The capture of connecting roads by the purchase of the majority of their stock, for the purpose of benefiting concerns in which the purchasers have an interest, is a process known in other parts of the country besides New Hampshire. The process is said to be sometimes made cheaper by device of a "bear" movement leading up to the purchase. Indeed, the New Hampshire case presents what many railroad men would regard as rather an antiquated and expensive form of capture. Going into the market to buy up stock forces it up, when the very object of capture is to gain the control with the least possible expenditure. If the road can be first embarrassed by legal proceedings, causing a depression in the stock, it will be possible to get the control for less than it is worth, and, by afterwards calling the lawyers off, to restore to its original value the property thus acquired, the purchaser thus enjoying the whole

benefit of the purchase, instead of the seller, as in the New Hampshire way, by putting himself by means of his fraud into a position in which he can perpetrate as many more as he likes, through contracts with himself.

But not, it appears, with entire impunity. There is a redress for the defrauded stockholder, even against capture by such means. The New Hampshire case shows the only way in which he can be efficiently protected. Any enquiry into the good faith of such transactions would be interminable; it would amount in many cases to an inquiry into the whole business of managing the roads—an inquiry for which courts of justice are ill fitted. It is to meet a difficulty very like this that in England a statute has been passed declaring that no person interested in any contract with a corporation shall be capable of being a director in it; in all such cases, the office, by virtue of the statute, becomes vacant. The New Hampshire case, and the numerous authorities on which it rests, show that, without any statute at all, our courts have it still in their power to protect the rights of stockholders in captured, "merged," or "gobbled" roads.

THE "INVASION OF ULSTER."

DUBLIN, November 3, 1883.

WHEN, on the suppression of the Land League two years ago, there was stone-throwing in Dublin, and the streets were cleared by the police and military in a rather summary fashion, with little regard to the liberty and convenience of citizens, a cynical member of the Irish Parliamentary party remarked to me that he supposed the Government now thought it was their turn to break the law. So it is perhaps at present with the Orangemen. The Land League, for many years, and of late the National League, having carried all before them in the South and Centre of Ireland, the Orangemen may consider it is only fair they should have their turn. Sir Stafford Northcote's visit led them to take heart of grace, as a schoolboy does when he is visited by a rich relation. Then came a host of letters and pronouncements against the continued "invasion of Ulster," issued by gentlemen of position and standing in the North. Lord Rossmore declares that but for his exertions a Nationalist meeting at Rosslea "would have been carried at a run, in spite of the presence of the military and police, and the consequence would have been simply frightful." He asks "how long the Government will allow this terrible state of things to continue." He calls upon Englishmen "to put a stop to a state of affairs which is a scandal to a civilized country," and says, "I have now cleared my own conscience in the matter, and the onus of what is certain to occur—unless immediate steps be taken to obviate it—must fall upon the shoulders of those who are responsible for the peace of the country." Mr. Cavendish Butler, a Deputy Lieutenant and Magistrate, asks:

"Why are our loyal Protestants to be insulted by the authorities allowing them [National League meetings] to be held in the county of Fermanagh? The Protestant Orangemen of the North have proved themselves to be a long-suffering people; but there is a limit to all things, and it will be well if our present rulers take warning in time, and by a wise and determined interposition of authority, put a stop to gatherings that can only end in strife and possible bloodshed."

Mr. Murray Kerr, Lord Crichton, and others follow suit, crowding the columns of the *Daily Express*, the great organ of Irish landlordism and Irish Protestantism, and those of other Protestant papers through Ireland. The *Express*, commenting upon an Orange manifesto, writes:

"Let them call it a threat if they choose. There it is to be read and pondered. It is no time to quibble about words. The meaning is clear, and the men to whom it is addressed do not shrink from the avowal of their fixed determination. They plainly tell the disturbers of the peace who trade upon the credulity of the populace, and fill their pockets with the profits of a disreputable calling, that their patience is exhausted, and that they are determined to take effectual measures to put a stop to every attempt to disseminate pernicious doctrines in their midst, and to bring confusion, turmoil, and crime into their peaceful, industrious, and law-abiding province. . . . It is for the Government to say whether they will allow the North to drift rapidly into civil war, as it seems likely to do if the disturbers of its peace, the emissaries of the National League, be allowed to pursue their reckless course."

This attitude has been approved by the Recorder of Dublin, one of our judges who might any day be called upon to hold the scales of justice in a cause arising from a dispute between Orange and Green. In the Protestant Synod he spoke with approval of "the stalworth young men of the North of Ireland who recently attempted to resist the invasion of Ulster in Monaghan and elsewhere."

The meaning of all this is that no more meetings of the National League are to be permitted in Ulster. If the Government will not proclaim and disperse them, the Orangemen will. Accordingly, when a meeting is announced, proclamations are issued, and the telegrams of Orange leaders arranging for the concentration at the same place of bodies of their followers read like the despatches between chiefs of army corps in war time. A National League meeting was arranged the other day at Garrison, a purely Catholic district, whereupon a placard appears addressed to "the Loyalists of Fermanagh," headed "1688-90"—the dates between which Ireland was reconquered by William III. and the Catholics practically enslaved for a century:

"The place selected for the preaching of their seditious doctrines is Garrison, one of the most out-of-the-way places in your county. Assemble in your thousands, and show these teachers of murder, assassination, and outrage that no distance will prevent your personally protesting against such a policy. . . . Let your actions at Garrison be placed on the same roll of fame as those of your forefathers at Bundrouse and Belleek [where the Catholics were defeated in the war of 1688-90.]"

This Garrison meeting was wisely abandoned by the Catholics of the district.

"A leading Orangeman of Fermanagh" regrets that a meeting at which he and his adherents appeared was permitted to proceed:

"Several of our men were seen to steal down and sound the river between them and the Nationalists with their sticks. On the return we passed within a quarter of a mile and in full view of the rebels. Several men rushed back to me and begged leave to charge them, disperse the meeting, and seize the arch and platform . . . The one all-absorbing and overmastering idea was to disperse the Nationalist meeting. Nothing else seemed worthy of a thought. The one regret is that it was not done."

Some months ago it was arranged that the Lord Mayor of Dublin (Mr. Dawson)—a by no means violent Nationalist, who has uniformly opened his banquets with the Queen's health to the tune of "God save the Queen"—should last Thursday deliver a lecture on the "Irish Franchise" in Londonderry. The Town Hall had been granted for the occasion by the Corporation. Under the influence of the prevailing excitement, an opposition gathering of Orangemen led by Lord Ernest Hamilton, son of the Duke of Abercorn, late Lord Lieutenant of Ireland, met the same day upon the walls of Londonderry. The corporation was hastily summoned, the resolution to grant the Town Hall rescinded, and the building thereupon occupied by an armed body with banners flying, sworn at any cost to "prevent the National League entering the North through the gates of Derry." Mr. Dawson, had accordingly, to deliver his lecture in a society room. There was considerable rioting, and several persons were wounded.

The "invasion" theory is a strange one. There are nine Catholics to every ten Protestants, in Ulster. The Protestant majority is centred in four counties—Antrim, Armagh, Down, and Londonderry—where they are as two to one. In the other five Ulster counties the Catholics are more than two to one. In the remaining twenty-three counties of Ireland together they are thirty to one. Whenever a National League demonstration has been held it has been composed of the inhabitants of the district. The "invasion" has consisted of two or three Parnellite M. P.'s from Dublin or across from London. To summon opposition meetings at the same place and hour, to bring together such inflammable materials, is strange conduct on the part of men who rave about civil and religious liberty—many of them deputy-lieutenants and magistrates who profess a reverence for law and order, and a desire to preserve the peace. Their language is certainly more inflammatory and seditious than much which has within the past year sent men to pick oakum and empty slop cans, in prison dress, in company with pickpockets. It would, however, be too much to expect the Irish Government to mete out the same justice or injustice to both parties. The Lord-Lieutenant and judges, the county inspectors and crown officials, have probably often dined at the same table as these Orange leaders; they attend the same churches, and read the same newspapers; while no treatment of the Nationalists—down to hanging and quartering without judge or jury—would meet with aught but approval in the daily atmosphere which they breathe, 'at least in Ireland,' the tone of which influences all but the strongest minds, and which has the power of making our lives pleasant, or the contrary. It may be said for the Government that it is more difficult to oppose men pursuing unjust courses under loyal and constitutional banners and watchwords, than to sustain those who seek constitutional changes too often in an unwise and refractory manner. The Orangemen are striving to uphold an old system of hateful ascendancy and injustice, under the guise of legality, while the Nationalists are seeking common rights and common opportunities for advancement. But none more than the Nationalists themselves help to confuse the issue. Too often do they give occasion for the charge of the *Express* that they are "foul-mouthed spouters." What did a National M. P. mean when he said the other day, at a National gathering in the North, that such meetings were "the beginning of the reconquest of the North by the Irish people and by Irish principles"?—or another, who is reported to have declared that "when Home Rule for Ireland was carried they [the Orangemen of the North] would submit as a lot of slaves"? Perhaps the speaker no more really intends the subjection of Orangemen than the Orangemen who cheer for "Bundrouse and Belleek" intend the re-enactment of the Penal laws.

It is difficult to withhold a certain admiration for the pluckiness of the Orangemen. If the Nationalists had their determination and spirit

they would long ago have won all they claim. We can never forget how, some years ago, a speaker at an Orange meeting ostentatiously tore in pieces an obnoxious Act of Parliament against party processions, how the Act after that remained a dead letter and was shortly repealed, and the gentleman himself was appointed to a lucrative post under Government.

Much of this dissension in Ireland is due to the fact that, since the arrangement of 1800, both parties have been obliged to seek their strongest allies in external force, opinion, or prejudice, and that they are never forced together in that personal consultation from which arise toleration, concession, and mutual respect. Where is now the Protestant spirit in Ireland which caused the Protestant Volunteers at Dungannon, in Ulster, in 1782, to declare, "that as men and as Irishmen, as Christians and as Protestants, we rejoice in the relaxation of the Penal laws," or which led the Irish Protestant Parliament ten years later to enfranchise their Catholic fellow-countrymen? The present state of things is disheartening. There is, however, encouragement in the entire abandonment of late, by the Orangemen, of any profession of opposition to or hatred of the religious tenets of their opponents. Only those who recollect their former spirit in this respect can measure the advance. Further progress in toleration is certain.

The abuse so freely exchanged between Nationalists and Orangemen is a matter of passing moment, and will soon be forgotten. Irish Nationalists must show by their language and policy that the best of their adherents represent the public opinion of Ireland, when they declare their desire for Home Rule to be based upon a conviction that it would be beneficial to Protestant and Catholic alike, to land-owner and tenant; and that it would strengthen rather than weaken the Empire. D. B.

Correspondence.

THE SENIOR SOCIETIES AT YALE.

To the Editor of The Nation:

Sir: The "Senior Society" evil at Yale may not be a question of general interest, but it is a question of vital interest to every lover of Yale, in which category are a great many of the readers of the *Nation*. I ask for space, therefore, as a graduate, to supplement and reinforce a recent undergraduate's communication appearing in your columns.

That the Senior Society system, as at present existing at Yale, is an evil, is scarcely denied by any one. Even those who have become members have often said as much in the time intervening between their election and initiation. The specific evils mentioned by your correspondent are well authenticated, and they are of such a nature as to threaten the future usefulness and retard the growth of this great college. Many graduates will testify that Yale is constantly deprived of donations from this cause alone. One case within the writer's personal knowledge is that of a comparatively recent graduate, who, in making his will, gave his property to Amherst, rather than give it to Yale, with this system in existence in the latter college.

If, in a class of 180, the affections of 150 are thus more or less estranged from their Alma Mater, it is obvious that unless in future years the thirty Senior Society men have more wealth than, perhaps, by the training of the societies they are likely to have, (and even then, unless they are very benevolent,) the material interests of the college are likely to suffer. Why is it to-day that Yale cries in vain for a gymnasium and dormitories? Perhaps it is because non-society graduates *won't*, and society graduates *can't*, foot the bills.

It may be said that the above is evidence of a mean and sour spirit. Ethically that may be so, but it is believed that it is only in this way that those in authority can be driven to a sense of the necessity of some reform which shall again reunite the scattered graduates of Yale into a band of men, full of college patriotism, devotion and enthusiasm. What wonder that the proverbial enthusiasm of the Yale undergradua te becomes converted into the indifference of the Yale graduate, when, from the time of elections in senior year, the class is divided into two factions, of which the non-society men, like the Butler party in Massachusetts, are said to represent the scum and leavings (with here and there an exception)? Nor is his enthusiasm for the college increased when, on his return to class reunions, he feels a certain something in the air that tells him he is out of place. The Senior Society graduate returns again and again to the college, and at the stated society reunions (such for instance as the "mid-winter bum") meets and fraternizes with distinguished society graduates and professors, and drinks to the greatness of Yale, while the non-society graduate, if he returns once, declares that he never will again. He feels out of place and glad to get away from his old college haunts! The above is doubtless an extreme case, but it represents in excess a feeling that exists in a less degree in a majority of Yale non-society graduates.

As suggested by your correspondent, the Yale Alumni can do much to reform the evil. So can the Faculty and the Corporation. But it seems to me that whatever is done, the initiative should come from the societies themselves; and I doubt not that many of the members of these societies are ready to do all they can to bring about a change in the existing state of affairs. It does not seem best or practicable to abolish these societies. Secret societies of some sort are a necessary and perhaps a desirable feature of our American college life. Let the societies increase their size at the same time that they increase the size of their buildings. Let them elect their members on grounds of good fellowship, and so form clubs, and not mongrel collections embracing in one body the wealthiest man, the most religious man, the best athlete, the best scholar, the most popular man in the class, &c., &c. Let them do away with their senseless mummeries and parade of secrecy, even if they have to go in swimming without a "Bones" pin in their mouths, or retire to rest without a "Skull and Key" pin fastened to their nightgowns; or even if they should lose opportunities of insulting ladies who speak to them about these societies. They would find that in the eyes of most people their manliness would not have suffered much by the metamorphosis. Let them try not to emphasize their superiority by word or deed. Very many are careful in this respect; and perhaps the wearing of these pins conspicuously is pardonable, though to see graduates 35 or 40 years old wearing them is discouraging, unless perhaps they are necessary as "passports into our best society." Let these or any new societies be less exclusive and less grasping, more open, liberal and fraternal. The societies themselves must move, and until they do so, we shall all note, with regret, the "conservatism" of Yale.

Graduate.

Notes.

Dodd, Mead & Co. will issue next month a three-volume edition of the "Letters and Poems of John Keats"; the poems occupying two volumes. The editor is a grand-nephew of the poet, John Gilmer Speed, who is able to furnish hitherto unpublished letters to Keats's brother George, a resident of the United States. Mr. Speed contributes also an introduction. The text of the poems is Lord Houghton's, and his notes have been retained. A novelty will be the reproduction by Bien, in color, of oil portraits by Severn of the three brothers Keats; and there will be several other illustrations. The edition will be printed from type, and limited.

Cupples, Upham & Co, Boston, will issue this month a Memoir of the Rev. Charles Lowe, by his wife, Mrs. Martha Perry Lowe.

'The World's Christmas Hymn,' by Wm. Hayes Ward and Susan Hayes Ward—described as "a chain of ancient and modern verses. . . deftly linked together"—will be published immediately, with twelve artotype illustrations, by A. D. F. Randolph & Co.

A very ornate edition of the New Testament —"Longman's," as it is called—bears for the American market the imprint of Houghton, Mifflin & Co. It is printed in brown ink, and its peculiarity, in other respects, consists in the free use of marginal and other decorations, and especially in the copies on wood of designs by a great number of old masters, representing scenes in the four gospels. These are all duly indexed, and offer some very interesting comparisons. The mechanical execution of the whole work is admirable.

Messrs. Scribner have published a popular edition of Mr. Cable's 'Grandissimes' in which we are gratified to find that the revision of the dialect has not gone so far as we had feared from the announcement.

A new edition of the 'Classified and Descriptive Directory to the Charitable and Beneficent Societies and Institutions of the City of New York' (Putnams) contains some six pages of additions, changes, and corrections to September last.

The same publishers venture a second extract from the 'New Guide to the Conversation'—'English as She is Spoken: Her Seconds Part,'—with an introduction by James Millington. But the plan of reproduction entire seems much the best for a joke whose effectiveness depends so largely upon its *size*.

The third volume of the revised edition of Bancroft's 'History of the United States' has appeared in due time (D. Appleton & Co.), coming down to "The Crisis," May, 1774. This volume contains some of Mr. Bancroft's best work, in showing the workings of the English colonial system as one of the principal causes of the Revolution, and tracing the history of the successive British administrations in their relation to the colonies. This volume has, probably, a more distinct unity and character of its own than any of the others. Except for the Writs of Assistance, which came in the previous volume, it contains the entire series of English acts which led to the Revolution; and the successive phases of the controversy are so fully illustrated by extracts from speeches and other documents, that it is possible to follow the history of the argument very satisfactorily. We are sorry that Mr. Bancroft has dropped even the few references which the first edition contained. In some cases the reader is really in justice entitled to

one. For example, at the end of Chap. xv. (p. 197) it is said that James Otis, in 1766, "enforced, in a pamphlet printed in London, a scheme for a general Parliament, in which every part of the British dominions should be equitably represented." In the earlier editions this pamphlet is not attributed to James Otis, but to "the press of London." The reader — whose memory perhaps may be weak—would be glad to know what is the evidence which assigns this pamphlet to Otis.

The complacency of the editor and publisher of the 'Real-Encyclopädie,' in sanctioning the proceedings of the compilers of 'Schaff's Religious Encyclopædia' in the reproduction of its articles, is not, judging from an article in the *Theologische Litteraturzeitung*, relished by some, at least, of the 'Real-Encyclopädie's' collaborators. Prof. Harnack there denounces the American work as an offensive specimen of American enterprise, saying that, in the cutting down and revision, the treatises have lost their essential characteristics, and declares his unwillingness to subscribe to the statements for which he is there made to appear as authority.

The Proceedings of the American Association for the Advancement of Science, at the Montreal meeting in August, 1882, are distributed in two paper-covered parts of about 300 pages each. This bulkiness might have been considerably reduced by omitting abstracts as worthless as that on the "Future of the Balloon" (p. 318), which does not contain a single idea. Mr. Horace C. Hovey's paper on "Subterranean Map-making" (p. 345) is accompanied by a tolerably accurate plotting of the Wyandot Cave, a still better one of the Luray Cavern, and a partial but trustworthy one of the Mammoth Cave.

A conspectus of Luther portraits is given in the December number of Cassell's *Magazine of Art*.

The Catalogue of Amherst College for 1883-1884 contains the names of thirty-one members of the Faculty, of whom seventeen are professors, four associate professors, and ten instructors. A noteworthy change has been the appointment by the trustees of Mr. William I. Fletcher, well known from his labors in connection with Poole's Index, and late of the Watkinson Library of Hartford, as librarian to the College. A smaller number of students appear in the catalogue this year: eighty-one seniors, eighty-six juniors, eighty-three sophomores, and seventy-one freshmen—a total of 321. The course of instruction is substantially unchanged. The "administrative rules" contain the kernel of the "new system," and state the conditions of grade which have been adopted in the award of diplomas at graduation. The recent action of the Faculty in regard to the recommendation of college graduates for the degree of Doctor of Philosophy, specifies a two years' course of study in two subjects of science or literature, or one subject of each, under the direction and to the approval of the professors in the appropriate departments; likewise a satisfactory examination upon those subjects, and a thesis upon one of them, together with the customary diploma and tuition-fees. The holiday intermission is of three weeks' duration, beginning December 18.

Those who desire to know the characteristics of the German civil service will find much help in the recently published first part of Professor Georg Meyer's 'Lehrbuch des deutschen Verwaltungsrechtes.' Ever since the appearance of this author's 'Lehrbuch des deutschen Staatsrechts' he has been regarded as an authority of the first importance. The portion just published deals with general theories, and with administrative law in the individual states of Germany. The part still to be completed will have to do with the administrative methods of the Empire. The author's point of view is purely objective. He insists upon an absolute exclusion of all political considerations from the methods of administration. Attention is called to the fact that, ever since the time of Stein, political sympathies have had more or less weight in determining purely administrative questions; but, in the author's opinion, the time has come to insist that local affairs shall be administered with something like what Hegel called "the Godlike indifference of science." We doubt if any thoughtful person can read this volume without an increasing conviction that, whatever is to be thought of German imperialism, in matters of administration Germany is far in advance of all other nations.

The combined publishers' catalogues which make the 'Publishers' Trade List Annual,' have just been bound together for the eleventh time, for 1883 (F. Leypoldt). This portion forms of course the great bulk of the indispensable volume bearing the above title; but 200 pages are devoted to the Weekly Record of New Books, July 1882-3, and its index, and to the Educational Catalogue, recourse to which will often be convenient and useful to the book purchaser as well as dealer. The Record is studded with explanatory notes on the books whose form, size, and cost are so scrupulously set down.

—The biennial session of the Astronomische Gesellschaft was held this year on September 14-16, in the Academy of Sciences, Vienna. German astronomy was represented by Auwers, Foerster, Vogel, and Schoenfeld. Wagner and Hasselberg were present from Russia, Prof. G. Forbes from England, Janssen and Loewy from Paris, Gyldén from Stockholm, Thiele from Copenhagen; and America was represented by Gould, of Cordova, and Pickering, of Cambridge. The President of the Gesellschaft, Doctor Auwers, reported upon the condition of the work upon the zones of stars, showing that the observations at all the observatories in connection therewith might be deemed completed, so that next year the printing of the official catalogue might be entered upon. It also appeared that the preparations for extending this great enterprise as far into the southern heavens as the parallel 23° south of the equator—an object for several years in contemplation—had so far advanced that the scheme might now be considered as secured. Professor Bruhns read a paper on the formulæ of astronomical refractions. Gyldén referred to investigations he had made on the theory of the perturbations of the planets, and to the labors at the Stockholm Observatory toward constructing tables of the planetary motions in accordance with his theory. Professor Weiss presented the first sheets of his new edition of 'The Wonders of the Heavens,' by Littrow, and showed drawings of Jupiter and Saturn made with the great twenty-seven-inch refracting telescope of the Vienna Observatory. He also laid before the meeting photographs of the solar corona taken in full daylight by Doctor Huggins. Doctor Elkin reported parallax determinations of southern stars executed by himself and Gill at the Cape of Good Hope. Pickering called attention to photometric investigations completed at the observatory of Harvard College. Janssen discussed the observations of the solar eclipse of last May, obtained on the Caroline Islands. Foerster gave an account of observations at Berlin, which appeared to prove that the ground pillar of the observatory, on which investigations had hitherto been conducted, had for the last twenty-five years been subjected to angular movements which were connected with the eleven-year period of solar spots. Doctor Gould reported quite similar observations on the sea-coast. Oppolzer alluded to his determination of the length of the seconds pendulum at Vienna. Foli gave an account of his new researches on precession and nutation. Steinheil, of Munich, referred to new constructions of telescopes calculated by him. The next meeting of the Gesellschaft will be held in Geneva in 1885.

—A work of much more than common interest has recently been issued by the Commission appointed to superintend the publications from the State Archives of Prussia. There are certain questions connected with the relations of Prussia and Russia at the time of the treaty of Tilsit that are now for the first time made reasonably clear. Herr Hassel, in his 'Geschichte der preussischen Politik,' 1807-1815, shows that the key to a knowledge of the relations of Alexander and Frederick William lies in the despatches sent from the Czar to the Prussian King by Major von Schöler. These despatches appear never to have been examined either by Häusser or Pertz. Their importance consists in the fact that Schöler went to the Court of the Czar not as the accredited envoy of Prussia, but as the private personal representative of the King. It is easy to understand, therefore, that his letters are of the highest value for the interpretation of the relations of the monarchs between whom he was the confidential messenger. Alexander opened his heart freely to the agent of the unfortunate King, and the letters of Schöler clear up many questions that have hitherto been involved in complete obscurity. Of still greater importance, perhaps, is the new light that Hassel throws upon the circumstances attending the dismissal of Stein. The papers of Count Götzen, many of them written in cipher, and all taken to Silesia in 1808, are found, with the help of a newly-discovered key, to contain important writings by Stein himself. With this discovery the present volume of Hassel closes, but not without informing us that many of the previous opinions of the historians are seriously at fault. For example, it is held by Pertz, Seeley, and others that the dismissal of Stein, after the decree of outlawry by Napoleon, was brought about by Goltz. Hassel shows, on the contrary, that Goltz had nothing whatever to do with the matter. The moving spirits are proved to have been Von Altenstein and Nagler; and the motive of these men is pointed out to have been their belief that in the future negotiations with Napoleon it would be essential to have no one in authority who would be personally offensive to the Emperor. Hardenberg was of the same opinion, and it was in consequence of this general belief that Stein was sacrificed. The volume, made up very largely of documents, is edited with the greatest care by one who for many years has devoted himself to a study of the archives.

GREAT BRITAIN AND HER COLONIES.

Bonds of Disunion; or, English Misrule in the Colonies. By C. T. Rowe, M.A., Author of 'Questions of the Day in Victoria.' London: Longmans, Green & Co. 1883.

An involved style and an inability to marshal acts and state conclusions in a striking and attractive manner will, we fear, prevent Mr. Rowe's little book from obtaining the attention which it deserves. It deals with a subject—the relations between Great Britain and her colonies—which the occurrences of the last eight or nine years have ripened to a sudden and unforeseen maturity. Before that time, although Englishmen were willing to admit that, ultimately, the British colonies must become independent communities, the admission contained no sense of

actuality. An Englishman admitted it precisely as he would allow the possibility of the sun burning itself out in some unconjecturable period of time. Not that one Englishman in a thousand knew anything whatever about these colonies or ever intended to learn. The interests of the average Englishman, so far as they extend beyond his own personal concerns, are strictly circumscribed by the island he inhabits. Even of the interior of Ireland he knows little more than of the interior of Timbuctoo. But instead of knowledge he possesses an abundance of faith. He believes *a priori*, and independently of all evidence, that wherever the authority of the British Crown and Parliament is acknowledged, there, by way of natural consequence, a larger amount of justice, order, contentment, progress, and well-being is to be found than could, in the nature of things, exist under any other arrangement. And, although not prepared to resist the demand for independence, supposing such to be made by any particular colony, he would have felt, while conceding it, that the colony was taking a step which it would never cease to regret.

The events of the last few years have greatly disturbed this placid and comfortable state of mind. The wars in Afghanistan, South Africa, and Egypt not only offended the moral sense of a large proportion of the nation, but, even to those who were not so offended, they forced home the fact that a nation which possesses a huge and widely-scattered empire is no longer the master of its own destinies. The peculiarity of these wars was that one and all were sprung upon an unsuspecting nation; in other words, that the policy of the nation, in its most important aspects, those of peace and war, had slipped out of Parliamentary and popular control, and was regulated by secret and irresponsible departments—a Foreign Office, an India Office, a Colonial Office, and the like.

As the secret history of their recent wars has slowly become known to Englishmen, they have discovered that they have been at once the dupes and tools of their own administrative agents. This new-born sense of a menace to their own liberties has constrained them to consider their distant dependencies from a novel standpoint, and it is, perhaps, allowable to look upon Mr. Rowe's 'Bonds of Disunion' as one product of this altered state of the national sentiment. At any rate, the facts which he sets forth and the conclusions he deduces are entirely in accord with it. Mr. Rowe takes the early history of Canada and the Australian colonies, and thus describes the manner in which an irresponsible, unscrupulous, and profoundly incapable Colonial Office actually managed these dependencies:

"The fact was, that the business of the Colonial Office was conducted entirely by permanent clerks responsible to no one. It was quite beyond the power of any Secretary of State for the Colonies to make himself acquainted, even in the most perfunctory way, with the real requirements of the colonies, or to decide satisfactorily upon the conflicting statements and claims brought before him. In his dilemma he sought the aid of his personal staff—men of great 'tact' in dealing with their superiors, and owing their elevation to that desirable social accomplishment, coupled with length of routine service. Frequent changes of government might bring as many changes of Colonial Ministers, . . . but the best of them could do little against the tact and *vis inertiæ* of the permanent clerks under whose dominion they rapidly but surely fell. . . . For these the colonies existed only on paper. They represented nothing more than the opportunity for some gracefully-turned composition, in which the reciprocal duties of Colonial Governors and peoples were pointed out in unexceptionable language, and quite in accordance with the most ancient office forms. The characteristics of this system of 'paper government,' as it was called by Burke, were vacillatory measures varied by tyrannical edicts. Caprice in everything, consistency in nothing, was the rule of conduct in Downing Street. The chief object of the permanent clerk, the ruler of a domain beside whose vastness the Empire of Imperial Rome dwindles down to a provincial empire, was to save himself trouble. If some obscure intriguer at home appeared likely to make himself troublesome in his efforts to procure for himself some exclusive privilege or piece of patronage in the permanent gentleman's territories, it was given to him as a tribute to his skill in bringing backstairs influence to work. But a deaf ear was turned to the colonist who could train no heavier metal to bear than the history of private wrongs or public misadventure, due to the ignorant rule of the Colonial Office.

"But with all his desire to save himself trouble, the permanent gentleman had contracted an inveterately bad habit of writing despatches and instructions the effect of which was, often enough, to deprive Colonial Assemblies of their just functions, and so to irritate them and force them into violent proceedings, such as political impeachments, the stoppage of supplies, and personal attacks on the local representatives of the Crown. But where the permanent gentleman did save himself a world of bother was in his treatment of important colonial bills sent home for the royal assent. On these he bestowed but scant notice, except when impelled by some burst of virtuous indignation to recommend their disallowance. 'The number of colonial laws which have been disallowed . . . would,' says Wakefield, who wrote with an intimate knowledge of the subject, 'form the subject of an incredibly curious return to the House of Commons.' But often enough the permanent official omitted altogether to present the bill for royal assent, as in one very characteristic case, where, through his delay, the royal assent was so long postponed that when the bill was sent out to the colony as an act, the question was raised, whether the assent had been delayed beyond the two years allowed for it by law; whether, having been so delayed, it was valid; and whether all the proceedings already taken under it were not thereby invalidated."

The evidence to substantiate the accuracy of this description Mr. Rowe produces in abundance from the history up to a recent date of Canada and Australia. He points out that the London Colonial Office was almost the one British institution which escaped scot-free from the wide reforming movement which followed upon the passing of the Parliamentary Reform Bill of 1832. Consequently, in this office the ancient traditional methods of governing colonies which had driven the United States into revolt were practised with unabated vigor till within the last forty years. The "permanent gentlemen" learned no wisdom from experience. Their primary proposition was this, that a colony had no *ratio essendi* except the benefit of the mother country. But if this proposition had been allowed to stand alone, it might have been argued that the mother country benefited in proportion to the wealth and greatness of a colony. Consequently it was balanced by another, that a colony must not be allowed to become too rich and powerful, lest it should shake off its dependence upon the mother country. Practically, the working of these two propositions caused the British colonies to be treated by the Home Government as a kind of sink for receiving the refuse population of the mother country. The government was made over to adventurers of all kinds, whose position in society enabled them to exert pressure upon the Colonial Office. The populations were recruited by criminals and paupers, the scum and dregs of the population of the great cities. These were crowded into ships without any regard for decency or health, and subsequently shot out upon the shores of Canada or Australia as so much rubbish with which the home authorities had no further concern. The results of this humane and enlightened conduct are described by Lord Durham in his famous "Report," where he contrasts the scene on the Canadian side of the border with that which could be witnessed upon the American side. This was as late as 1840:

"On the American side all was activity and bustle. The forest had been widely cleared; every year numerous settlements were formed, and thousands of farms were created out of the waste. The country was intersected by roads; canals and railroads were finished, or in the course of formation; the ways of communication and transport were crowded with people and enlivened by numerous carriages and large steamboats. Bridges, artificial landing-places, and commodious wharves were formed on the lake frontages as soon as required. Townships were growing apace, and the stability and magnificence of their buildings might have done credit to populated centres of the Old World. On the British side, with the exception of a few favored spots, where some approach to American prosperity was apparent, all was waste and desolate. There was but one railroad in all British America, and that one was only fifteen miles in length. The ancient city of Montreal could not bear comparison with some of the most recent American cities. The difference was, however, most manifest in the country districts. On the Canadian side was a widely-scattered population, poor and apparently unenterprising, though hardy and industrious, separated from each other by tracts of intervening forest, without towns or markets, almost without roads, living in mean houses, drawing little more than a rude subsistence from ill-cultivated land, and seemingly incapable of improving their condition. In the eastern townships of Lower Canada, upon the border line, it was a common practice for settlers, when they wished to meet, to enter the State of Vermont, and make use of the roads there for the purpose of reaching their destination in the British province."

The story of the early history of New South Wales and Australia is even more dismal to read than that of Canada. Here the sagacity of the London Colonial Office devoted all its energies to the creation of a flourishing colony through the almost exclusive agency of convicts and what Carlyle used to describe as "unmentionable women." The reader who learns for the first time of these projects, equally insane and immoral, is apt to wonder how a single colony still maintains its connection with the mother country—why they did not, one and all, rise in revolt as the American colonies had done before them. Mr. Rowe explains this. The impulse which, primarily, built up the latter colonies was not the desire for worldly gain, but for religious freedom. Hence among the early settlers of this country there always existed a higher morality, a greater amount of public spirit, than was possible in Canada or Australia, recruited as the population there was from the offscourings of the British population. Add the possession of charters which mightily fostered the desire and the capacity for self-government, and the readiness to resist oppression. No such process of education was possible in Australia or in Canada. In the former colony, especially, the entire population consisted of "squatters" holding "runs" of land from the state for the pasturage of their sheep and cattle, and convicts who had been "assigned" to them—in plain English, sold into slavery—to act as laborers upon their estates. In such a community there could be no joint action, no corporate life. As free emigrants, in the course of time, entered in sufficient numbers to reduce the squatter and convict population to numerical insignificance, the stupid despotism of the Colonial Office necessarily came to an end. The colonies obtained representative institutions, and the Governor, appointed from England, remained the solitary political link connecting it with the mother country. This link cannot, in the nature of things, hold for long. Sooner or later there must arise in each of these distant dependencies some burning question, in which the representatives who embody the desires of the people, and the single functionary who represents the London Colonial Office, will find themselves in irreconcilable antagonism, and then a separation will be inevitable. It is natural that Englishmen should look forward reluctant-

ly and with apprehension to the breaking up of an empire the vastest that the world has ever seen. But that dissolution will not come until imperial rule has, so to speak, fulfilled its mission, and Great Britain, as the mother of free nations, will have achieved a far higher glory than as the ruler of unwilling dependencies.

CHILDREN'S BOOKS.—III.

THE globe has become a squeezed orange for Colonel Knox, and his "Boy Travellers" series ends with a fifth volume, on Central Africa (Harpers). To this region our world-tourist frankly confesses he has never yet gone in person, and that more than heretofore he has had to fall back on the books of the explorers. The route to which he confines his own adventurers is a not impossible one even for boys: it lies up the Nile to the Albert and Victoria Lakes, thence across country to Tabora, and thence, turning their backs on Ujiji and Tanganyika, to the east coast and to Zanzibar. But, as usual, a much larger area of the continent is covered in conversation than by actual journeying, and excuses are made for telling what Schweinfurth saw and what Livingstone and Stanley did, with something about the Niger, the West Coast countries, etc. Pictures, for the most part authentic and pertinent, abound as in the earlier volumes, and Colonel Knox's humor is not visibly restrained by his inability to draw upon his own experience. The little library which he has created with so much painstaking, ranks among the most instructive of the juvenile publications of late years, as among the most entertaining. There is very little art in the composition; the literary style is certainly not a model; the woodcuts have too frequently determined what the text should be, instead of vice-versa; and still the event has shown that the writer had a mission, and that he knew how to recommend himself to the young. He has had a host of imitators, but hardly any rival.

We are really sorry that Mr. Edward Greey gives us in his latest annual, 'The Bear Worshippers of Yezo' (Lee & Shepard), what he tells us is the last of his series illustrative of the Japanese and their empire. We should have welcomed one on Formosa and Riu Kiu (Loo Choo), with which, as a sailor and traveller, he is personally familiar. His work is marked by accuracy in details, and to sympathetic observation he adds the fruit of critical reading of native and foreign authors. Having the eye and fingers of an artist also, he designs his own covers, so that, instead of the hodge-podge of Asiatic elements usually made by ignorant designers, we have in his outsides a study that is pleasing and highly suggestive. He takes us, in the present volume, in company with the American family of Jewetts, into Yezo and Karafuto, or Saghalin. We brush against Ainos, Japanese, Russians, and the various savage tribes on the frontiers of the Czar and Mikado. With pen and pencil the author depicts the bear-hunts, festivals, worship, courtship and social customs, fishing, hunting, and trapping, and makes a story both readable and highly amusing. It *is* interesting to study the Yankee among the seal-hunters, as well as to see the Ainos as the Japanese see them. Mr. Greey's truthfulness is shown in this fact, that his illustrations (copied from Japanese books), rather than his text, agree with Miss Bird's exaggerated description of the alleged hairyness of the Ainos. From our own observations of these straight-eyed and full-bearded people, so different in race from the Japanese, we were led to inquire into the cause of their vast reputation for shagginess. Finding it to have slight foundation in fact—since an average hundred British or American male adults stripped for a bath would show equal or greater bodily hirsuteness—we were led to seek elsewhere for explanation. The Ainos, conquered by the Japanese, who have less hair on their bodies than Europeans, are vulgarly believed by their masters to be descended from dogs, and the sketches and epithets of the Nippon people are responsible for an impression that here serves well a maker of entertaining books. 'The Bear Worshippers of Yezo' is a capital book, which even upon Young America's jaded mental palate will fall with a new zest.

In 'Our Boys in China' (Lee & Shepard) we find another Christmas book for boys, which is one of a series. Mr. Harry W. French, last year, showed us Scott and Paul Clayton in India. We have them this year first shipwrecked in the China Sea, and then busy at work in seeing China from the inside. Perhaps we are yet to see Corea and Japan, or Alaska. 'Our Boys in China' is not, however, a mere book of travels made to utilize a publisher's stock of cuts. It contains a good story, with a beginning, middle, and end. This is a good thing, because the text is not so full of dialogue as Mr. Greey's, nor so spiced with jokes and anecdotes as Mr. Knox's. The illustrations are abundant and intelligently selected, and the clearly given information is conveyed in a lively style without overweighting the story. Even to those who have read many books on China, the one before us is interesting, and it will hold a boy's attention. We may even hope that by means of such literature the legislators of the future may learn something useful to assist them in making laws on Chinese immigration. Since, in this class of books, the cover is of much importance, we must condemn the wretched taste that mixes Japanese elements in a Chinese composition—an error from which the text is wholly free.

There is a singular blending of good and bad in 'The Knockabout Club in the Tropics' (Estes & Lauriat). Some of the many illustrations are well executed, and present characteristic phases of Southern nature and life, while others are merely perfunctory, having no relation to the letter-press, and still others are positively untruthful. Instances of the latter class are "A Native Lady" (p. 205), and "Castle of Chapultepec" (p. 217). Most of the stories woven into the narrative are spirited and well told; but the personal adventures of the "Club" are little noteworthy, and are recounted in a style which is at once coarse and inane. The literary defects of the book, joined with a considerable inaccuracy, do not help the proof the author proposed to give that "our plan of getting an education is the correct one." The Spanish of the work is exactly that barbarous nondescript which the American engineers in Mexico speak, and it is used here with all their easy confidence, as of men who know their linguistic powers, and, knowing, dare exhibit them.

The sayings and doings of 'Three Vassar Girls in England,' by Lizzie W. Champney (Estes & Lauriat), afford the reader but little entertainment. He needs must ask himself the *raison d'être* of so dull a book, and thinks the question partly answered when he discovers that among the profusion of woodcuts are many which are neither new nor good, and do not so much illustrate the story as hang together, so to speak, by means of it. The heroines are represented as charming and highly intelligent girls; but, though they seem well informed and quote much poetry, they have not attained to mastery of correct English; nor is the strong, pronounced type to which they belong consonant with that finer culture and higher breeding which Vassar graduates ought to show and which sensitive criticism demands.

'Speech and Manners' (Chicago: Jansen, McClurg & Co.) is an excellent little treatise, appropriately dedicated "to all who wish to teach or learn," and Miss E. S. Kirkland very skilfully sugars the instruction-pill. Many common errors of speech are brought to light and dwelt upon forcibly, and many defects in manners, more especially those which children are apt to show, are clearly pointed out. The necessity of habit in order to speak correctly, and of unselfish consideration for others in order to act courteously, are strongly insisted on. Good suggestions are made with reference to composition and letter-writing. The book is an admirable one for mothers to read aloud to their children.

We are glad that Alice Cary's 'Clovernook Children' (A. C. Armstrong & Son) has survived the competition of thirty years, and is reissued to do its part in satisfying the cry of the nursery for stories, more stories; and also, let us add, in shaping the moral sense of its small readers. These tales are pictures of the writer's youthful experience in Ohio, and are pleasantly written despite their undisguised ethical purpose. "A true story" seems endorsed upon each one of them. It marks the limitations of this author's mind, that what is now put forth as a companion volume, 'Snow-berries'—a much later work—is distinctly inferior, being drawn from Miss Cary's imagination, and not from observation. The verses, too, which are tagged on to every story, are commonplace, and such as no one would wish a child to commit to heart—a rough test, but perhaps the best we have in judging of poetry for the young.

SKETCHES OF LIFE IN INDIA.

Twenty-one Days in India; or, the Tour of Sir Ali Baba, K.C.B. By George Aberigh-Mackay. A New Edition, with Illustrations. London: W. H. Allen & Co.

A MULTIPLICITY of causes has conspired to impress on English residents in India a character of uniqueness. Many of the distinguishing traits of what are known as Old Indians are the all but unavoidable result of a lengthened sojourn in a tropical climate: others are due to incessant contact with a subject race of people in every way peculiar; and others still are such as everywhere demark the denizens of a colony from those of its mother country. But noticeably in India, among British foreign possessions, the one object of well-nigh the entire immigrant population is to store up a competency with all expedient despatch, and then to shake from their feet forever the dust of a land in which they have endured so much and enjoyed so little. As to Englishmen who, from a protracted abode in India, have become enslaved to the deteriorating, if not debasing, mode of existence which almost alone is possible there, and from whose memory the scenes and the associations of their youthful years have gradually become so obliterated that they are content to go on living in exile, and so to die, the number of those unfortunate fossils is rapidly decreasing. As being, taken at the very best, but of the nature of uninteresting anomalies, they may be ignored save by curious students of morbidism and degeneration. Nor, though more abundant, are in a less degree dreary and wearisome, to any but the most philosophic temper, the retired Indian senilities who, at Cheltenham, Bath, and Clifton, have much the effect of so many wet blankets on

their hapless, unindianized neighbors. As might be expected, their intrinsic insignificance is denied, by those about them, the homage which was so long paid to it by the false and mercenary obsequiousness of Orientals. Thoroughly wretched, chiefly on this account, themselves, they would seem to have retained the sole faculty of reducing others to misery something like their own. Fortunately, however, the members of this stamp of oppressive beings are, owing to various circumstances, becoming fewer and fewer nearly as fast as their congeners, the denaglicized Englishmen, whom they left behind in the East. But, to say truth, the Old Indian, even in his most favorable estate, is not likely to be engaging. Lord Macaulay, in one of his earlier letters, asks whether he is not in fair training to be as great a bore as if he had himself been in India, "that is to say, as great a bore as the greatest." His implied appreciation of the class of persons to which he refers was the only just appreciation that, without the longanimity of the man of Uz, was, or is, generally possible.

Very striking is the change which has passed on English society in India within the last generation; and to one who, like the writer of this notice, finished his career there upward of twenty years ago, the extent of that change is brought home most vividly by Mr. Aberigh-Mackay's attractive pages. Hardly could a revolution be more complete than that which has been gradually wrought by the transfer of the government of India from the East India Company to the Crown. And this revolution has affected both the governing classes and the governed. Illaudable, and even deplorable, were divers of the features of English society in India under the rule which the mutinies of 1857 availed to bring to an end. Yet, while that rule lasted, the natives of the country were far better comprehended by their masters than they are at this moment: and the principles on which they were controlled were such as only that better comprehension could have suggested. Instead of being more loyal than they were of old, they are at present, in no small degree, notoriously much less loyal. But a set dissertation would be required in order to depict, with any approach to fulness, the India of our day as compared with the very different India of a quarter of a century ago.

Mr. Aberigh-Mackay's exceedingly clever chapters are absolutely open to no adverse criticism, if we except a single trifling matter —namely, their collective title; for no one, surely, would gather from it that they consist of one-and-twenty typical sketches of character. For apposite knowledge, acuteness, and subtlety of discrimination, graceful lightness of satiric touch, unstudied pathos, and uniform pronounced excellence of literary execution, the book stands forth among ten thousand. From end to end of it one might try, and try again, without being able to point to a dull page. Even to the general reader, local as is its color, it cannot fail to be highly amusing, though, of necessity, a spice of the most exquisite of its fun must here and there be lost on him. To give an instance of what is here meant, of course he will marvel greatly at the mysterious excerpt from the "Rigmarole Veda," "Kwaihaipeglaondjeldikaro," which, however, by no means belongs to the same category as Southey's "Aballiboozobanganorribo." But such esotericisms are, after all, very infrequent.

As has been implied, quotation from the book may be made advantageously, though taken almost at random. Here, then, is a paragraph from the chapter entitled "The Archdeacon, a Man of Both Worlds":

"Why should I spend a day with the Bishop? What claim has the Bishop on my improving conversation? I am not his sponsor. Besides, he might do me harm: I am not quite sure of his claret. I admit his superior ecclesiastical birth: I recollect his connection with St. Peter; and I am conscious of the more potent spells and effluences of his shovel-hat and apron. But I find the atmosphere of his heights cold; and the rarefied air he breathes does not feed my lungs. Up yonder, above the clouds of human weakness, my vertebræ become unhinged, my bones inarticulate, and I collapse. I meet missionaries, and I hear the music of the spheres; and I long to descend again to the circles of the every-day inferno where my friends are.

'These distant stars I can forego;
This kind, warm earth is all I know.'

I am sorry for it. I really have upward tendencies; but I have never been able to fix upon a balloon. The High Church balloon always seems to me too light, and the Low Church balloon too heavy; while no experienced aëronaut can tell me where the Broad Church balloon is bound for. Thus, though a feather-weight sinner, here I am upon the firm earth. So come along, my dear Archdeacon: let us have a stroll down the Mall, and a chat about Temporalities, Fabrics, 'Mean Whites,' and little Mrs. Lollipop, 'the joy of wild asses.'"

In like manner as the titles of the chapters are often piquant, so, only invariably, is whatever follows them. Whether the sketches are, or are not, introduced in the spirit of "The A. D. C.-in-Waiting, an Arrangement in Scarlet and Gold," and "The Travelling M. P., the British Lion Rampant," the reader soon feels assured that he is doomed to no disappointment with what is coming. Stimulation and incitement to go on and on to the close are nowhere intermitted.

Very different from the tone of the extract given above is, as in many a passage more of the volume, that which marks the conclusion of the portraiture of "The Old Colonel":

"It is better to dress him up in an old red coat, and strap him on to an old sword with a brass scabbard, that he may stand up on high ceremonials, and drink the health of the good Queen for whom he has lived bravely through sunshine and stormy weather, in defiance of epidemics, retiring schemes, and the Army Medical Department. It is good to ask him to place his old knees under your hospitable board, and to fill him with wholesome wine, while he decants the mellow stories of an Anglo-India that is speedily dissolving from view.

"The old Colonel has no harm in him. His scandal blows upon the grandmothers of people that have passed away; and his little improprieties are such as might illustrate a sermon of the present day.

"But you must never speak to him as if his sun were setting. He is as hopeful as a two-year-old. Every *Gazette* thrills him with vague expectations and alarms. If he found himself in orders for a brigade, he would be less surprised than any one in the army. He never ceases to hope that something may turn up, that something tangible may issue from the circumambient world of conjecture. But nothing will ever turn up for our poor old Colonel, till his poor old toes turn up to the daisies. This change only, which we harshly call 'death,' will steal over his prospects; this new slide only will be slipped into the magic lantern of his existence, accompanied by funeral drums and slow marching.

"Soon we shall hardly be able to decipher his name and age on the crumbling grave-stone among the weeds of our horrible station-cemetery. But what matters it?

'For his bones are dust,
And his sword is rust,
And his soul is with the saints, we trust.'"

No whit less conspicuously able are Mr. Aberigh-Mackay's pictorial illustrations than is his letter-press. What the gifted author would have achieved, had he lived to make more than a first appearance in literature, it would be bootless to speculate. Certain it is, however, that the promise which he practically gave is to be acknowledged as of the highest, and his untimely death cannot be contemplated but with sincere regret.

FINLAND.

Finland und seine Nationalitätenfrage. Von Max Buch. Stuttgart. 1883.

FINLAND—or, as the Finns call it, Suomi—the northwestern division of the Russian Empire, is in many respects its most heterogeneous portion. It is semi-Arctic, a land of lakes and moors, non-Slavic, non-Aryan, Lutheran, semi-autonomous, semi-constitutional, ruled by the Czar as Grand-Duke, with finances and an army of its own. Herr Max Buch, a German scholar of South-Baltic Russia, sketches the land—after a two-years' study on its soil—its dominant population, and its nationality strife in a way which admits of no doubt as to his competency as an observer, inquirer, and unbiassed judge. His book is of very small compass, but replete with fresh and interesting information, clearly and concisely presented. His main subject is the "nationality question," which has so violently agitated the Grand-Duchy for some decades; and concerning this curious historical movement alone —barring introductory remarks—can we follow him in his observations.

In the earlier centuries of our era almost all northern Russia was occupied by branches of the Finno-Ugric family of tribes. At what time the Finns proper—next to the Magyars now the most civilized branch of the family—entered and occupied the peninsular country which they at present inhabit, is not definitely ascertainable. They came there as nomads, living by fishing and the chase, but there learned agriculture. Their agglutinative Turanian tongue was rich and flexible, like the Magyar—as their great epic, the 'Kalevala,' parts of which are believed to be about a thousand years old, clearly shows; but they had appropriated many words denoting objects of more advanced domestic life from Teutonic neighbors on the south, Saxons and Goths, and were now hemmed in by Goths on the west, and Russians on the south-east, whose influence upon them became permanent. Russian missionaries seem to have made unsuccessful attempts at introducing Christianity. In the middle of the twelfth century Saint Eric, King of Sweden, and the Bishop of Upsal led a crusade into Finland, conquered in bloody battles, and converted the people by force; but it took a century and a half to complete the conquest. The Finns shared the freedom of the Swedish peasantry, and with the Swedes were the first to adopt the Reformation. Swedes settled numerously in the islands and maritime districts of Finland, forming the ruling and leading classes of society, and propagated both their language and culture. The interior, however, remained Finnish. Lutheran Christianity was the bond of union between Swedes and Finns, and secured general fidelity to the crown of the Vasas.

As early as 1725, shortly after the desolating war between Charles XII. and Peter the Great, the demand found vent that royal decrees and orders should be issued both in Finnish and Swedish. The Finnish deputies at the Swedish Diet, a few years later, formulated similar demands. The loyalty of the Finns, however, remained unshaken throughout all the Swedish wars with Russia, although during the war of Gustavus III. a few Finnish noblemen rashly attempted to make their country an independent state under the protection of Russia. The nobility and the official classes were Swedish by descent and in sentiment, and the Finn peasantry dreaded Russia's serfdom. Finland's geographical position, however, rendered its successful defence against Russia impossible, and the invasion of 1808 and peace of 1809 annexed it to

the Czar's dominions. Alexander I. was wise enough to grant his new subjects favorable terms of allegiance, the fundamental laws which existed under the Swedish sceptre remaining in force under the Russian. Swedish continued to be the official language of the country, agreeably to the general demand of the Diet of Borga, held in 1809 under Alexander's auspices.

The Finnish language had, however, some time previously become an object of scholarly attention, though the Swedish had not ceased to be the exclusive medium of education and polite culture. Finnish songs, legends, and other national relics had been collected, and even an attempt made to issue a newspaper in the long-neglected idiom of the peasantry. On the separation from Sweden, though this was at first very keenly felt by all Finlanders, a spirit of Finnish nationalism began to pervade the people, and especially the student youth. Scarcely a year had lapsed under the new régime when Swedes had reason to complain of "Fennomania." The new movement became so active, its spread so rapid, that the Swedish opposition to it could soon be stigmatized as "Svecomania." And Fennomaniacs and Svecomaniacs have since, oddly enough, become and remained the distinctive appellations of two great parties dividing Finland on the nationality line. The advance of the Finnish party has been constant and irrepressible, conquering the popular classes and reaching the higher. The Finn language has been studied, resuscitated, developed, purified, enriched, and adapted to all literary purposes with a zeal and ability rivalling the efforts in the kindred field of Magyar linguistic renovation. A whole literature has been called into life, embracing lyrics, epics, dramas, speculative and scientific works, journals, etc., and including in the list of its poets and scholars such names of world-wide fame as Lönnroth, Runeberg, Castrén, and Ahlqvist. The Finn language has obtained its legitimate share as a medium of public instruction, and is now recognized as their vernacular by five-sixths of the population. Czar Nicholas, when flushed with his victory over revolution and nationalism in Hungary, violently endeavored to check this national movement in his dominions by prohibiting the publication in Finnish of other than religious or economical books; but this brutal interference came too late. Alexander II., pursuing a different line of policy, revoked the order, promised reforms, convoked a diet (which his father never did) in 1869, signed laws in favor of future official equality of Finnish and Swedish, and granted the quinquennial periodicity of the legislature. Without taking sides in the contest between Fennomaniacs and Svecomaniacs, Alexander thus strengthened the nationalistic tendencies of the former, and by his liberalism reaped the reward of increasing loyalty to the crown among all classes of Finlanders.

The Finlanders of both parties, however, and of both Aryan and Turanian race, are patriotically devoted to the cause of their country's autonomy, as far as it goes, or may in future be expected to go. "Finland for the Finlanders!" is the watchword of all; and this is even now no empty cry, for only native Finlanders enjoy rights of citizenship in the Grand Duchy, and even Russians (of whom there are about twenty thousand, including a garrison of seven thousand) are legally foreigners. All Finland, not excluding ardent Svecomaniacs of noble Swedish descent, would readily follow the banners of the Czar in case of a Swedo-German invasion; and, on the other hand, even the Finnish peasantry would offer a stanch passive resistance—for no other can be thought of under the circumstances—to encroachments by the Czar's Government on the old and constitutional liberties of the country. That the dream of entire independence, to be achieved by complete nationalization first and skilful political manœuvring between Slavs and Teutons next, haunts many an enthusiastic Finnish mind, requires no proof. The national army of the Grand-Duchy, however, instituted only for territorial defence, is insignificant; and even if it were raised to a possible maximum of about seventy thousand men (the total population is a little upward of two millions), and commanded exclusively by natives, which it is not, it could play no important part in a great clash of Slav and Teuton, especially as the most flourishing districts are open to invasion by sea or by land.

FAHLBECK'S FRANK MONARCHY.

La Royauté et le Droit royal francs durant la première période de l'existence du royaume (486–614). Par le Docteur Pontus-E. Fahlbeck, de l'Université de Lund. Traduit par J.-H. Kramer, Licencié ès lettres. Lund: En vente à la Librairie Gleerup (Librairie Universitaire). 8vo, pp. 346.

THE period between the dissolution of the Roman Empire and the establishment of the feudal régime is the most obscure and puzzling in the history of institutions, and there remain many problems as yet unsolved, even after the labors of Waitz, Roth, Sohm, and Coulanges. The antagonism between the German and French schools—in which, it must be confessed, national prejudices have sometimes been allowed to interfere with strictly scientific methods—would seem to invite scholars of other nations into the arena who might be supposed to be free from the bias in question. The publication, therefore, of a Swedish scholar upon this subject is a welcome contribution to the discussion. His work is confined to a very narrow field—a period of hardly more than a hundred years; but of this period we have an exhaustive examination, resulting in what we may regard as on the whole the best treatise that has yet appeared upon the institutions of the early Merovingian period.

It is easy to see why Doctor Fahlbeck has ended his inquiry with the year 614—the year of the decree of Clotaire II. The seventh century was a very different thing from the sixth. It has been fully established, especially by the researches of Roth, that the early Merovingian monarchy contained not a single element of feudalism, except in the germ; that the relation of King and subject had not yet begun to be superseded by that of lord and vassal; that land was still a matter of property, not of tenure But in the seventh century the causes began to work which reached their full effect two centuries later, and gradually built up the feudal institutions. Our author does well, therefore, to confine himself to the period of the pure Frank monarchy. He says (p. xii. of the Preface):

"Frank society in 752 is no longer what it was in 511, at the death of Clovis. A new social power, aristocracy, had arisen by the side of royalty, and this event shattered and transformed the Constitution. The position of the royal power was completely modified; and in a state like the Frank kingdom, in which royalty is everything, a modification of its position produced transformations in all domains of political and social life."

"Royalty is everything." This is the key to the theories of the treatise. The author begins his preface by saying that a more correct title for his book would have been 'The Political Organization and the Public Law of the Frank Kingdom during,' etc. By selecting the actual title, he wished to emphasize his point of view: "We consider that in the Frank kingdom the state is absorbed by royalty, and the public law by the royal authority (*le droit public par le droit royal*)." This statement is, we think, perfectly true, and it is the view of the Frank Constitution to which the labors of the German school have been tending, although no one of them has perhaps formulated it so definitely, and elaborated it so fully, as Doctor Fahlbeck. One of the most instructive and original parts of his work is contained in chap. i. § 2, "The Interior Conquest," in which, after having described the "exterior conquest" by Clovis, he states the problem of the period as follows:

"The question which first presents itself at this point of our studies, and before touching upon the organization of this kingdom, is how the foundation of a new political power could give place to the birth of a new political and social order; how the new kingdom became a new society essentially different from the two old societies—the German and the Gallo-Roman; or, in other words, by what path and by what necessity these last were transformed and became the Frank society."

This question he answers by considering in detail the immediate consequences of the establishment of the kingdom upon, first, the Gallo-Romans and, secondly, the Germans.

"The new régime," he says (p. 58), "proceeds from the union of separate elements, but does not, nevertheless, make out of them a mechanical composition. The imperial Roman authority (*droit*) is so combined with the royal Germanic authority that the first furnishes the substance of the new constitutional right, and the second its form. The rights and notions of sovereignty are Roman, the right itself is Germanic. The royal Germanic authority assimilates to itself the imperial Roman authority, without, nevertheless, by this act modifying its nature. It constitutes, as before, a personal right."

In these words we find the characteristic which distinguishes the theory of Doctor Fahlbeck from that of Waitz, Sohm, Dahn, and others, who, like him, have represented the royal power as the controlling force in the creation of the Frank kingdom—that the conquest was made not by the people, but by the king. The German school of writers would hold that the kingly authority of Clovis was, to be sure, derived from the primitive kingly office of the Germans; but they would hold that it was not merely combined with and modified by the imperial authority, but essentially transformed by it. Our author holds that royalty was essentially the same before as after.

"It is only," he says (Preface, p. ix.), "because the Germanic king is not an agent (*mandataire*) of the people, but solely of himself, and that Germanic royalty is an independent power, based upon its own right, that it can become the centre of a state—organize it. Now, the reason of this fact can, in its turn, be only this: that royalty rests upon the personal right of its possessor (*détenteur*)—that the royal dignity, with all that it carries with it, is the private property of the king."

This proposition Doctor Fahlbeck undertakes to prove in the second section of the second chapter, "Le droit du Roi au Royaume." In the primitive Germanic royalty we find, he says, three characteristics which "distinguish it from all other forms of government among the Germans, and contain all the elements of its history" (p. 95): it is independent, irrevocable, and hereditary. It would certainly require very positive evidence to establish a proposition so directly contrary to all accepted theories of the Germanic Constitution, and such positive evidence cannot be said to be present. It appears to us that our author, a Scandinavian, has been over-influenced by analogies drawn from Scandinavian history. It is well known that Tacitus ('Germ.,' 44) describes the Swedes as

having a more vigorous royal power than any other of the German nations. It is known, too, that the Norwegian kings reigned by strictly hereditary right, and the royalty of Harald Harfager (p. 92) is the most striking illustration of the theory here presented. But most of the examples are taken from the history of the Germanic nations after their settlement within the empire; and, strangely enough, the author purposely leaves out of view the other Scandinavian nations and the Anglo-Saxons (p. 110), on the ground that "we do not wish to withdraw too far from the field in which all our researches are concentrated, the Frank kingdom." But the field now under consideration is not the Frank kingdom, but the primitive Germans, and it is unaccountable that, in this discussion, he should leave out those very nations which are admitted to have preserved the primitive Germanic institutions most pure and for the longest time. Certainly Anglo-Saxon history would afford very little support to his view. We cannot, therefore, reconcile it either with the statements of Tacitus or with the facts of history.

We cannot think, however, that the failure to prove this theory detracts materially from the value of the book. We agree fully with the author as to the controlling position of the Frank kings, and only differ from him as to the source of their authority; and he, too, derives it largely from Roman imperialism, only by way of modification, not as the essential basis of the power. When he says (p. 94) that if he were forced to accept Dahn's view that the German kingship was primarily elective, he would necessarily agree, with Sybel and the Romanists, that the Frank monarchy was a continuation of the Roman Empire, he appears to mean that, if we consider the Frank king to have borrowed his type of authority from the Roman Empire, this is equivalent to making him a Roman official, the successor, in a sense, of the Roman emperor —that the kingly office after the conquest was absolutely a different thing from that before the conquest. But this does not follow. The transformation wrought in this office was just the same, except in degree, with that effected in English royalty by the Norman conquest. It was, so to speak, *imperialized*—transfused with a conception of authority wholly foreign to the Anglo-Saxon kingship; so that, being the same office, it was yet a wholly new one.

Chapter iii., "Le Roi et le Gouvernement," contains an excellent sketch of the administrative system of the Frank monarchy of the sixth century, not differing materially, in its main features, from that given by Sohm. The next chapter, "Le Roi et les Sujets," discusses the important subject of the development of that aristocracy which in the end so completely transformed the government. The turning-point he considers to have been the reign of Clotaire II., who succeeded to the throne of the united kingdom after the stormy times of Fredegonda and Brunhilda. This young prince, "brought up under the rule of the nobles, had never known any other" (p. 217). Accepting facts as they were, he issued an edict which has been called "the Magna Charta of the Frank Kingdom," and which constituted "in reality a veritable revolution in the constitutional law which had existed until then." With these documents, by which the king practically abdicated his absolute power, begins the development of the feudal aristocracy. The argument assumes that the *Præceptio*, sometimes ascribed to Clotaire I., was really the work of his grandson, as is held by Waitz and Boretius. This question is argued at considerable length and with great cogency in an appendix. It does not, however, appear to us essential to the author's main argument.

The summary (Résumé), at the end of the treatise, states with great ingenuity and force the bearing of the view here presented of the royal authority upon the development of the feudal principle. "Feudalism rests," we are told (p. 239), "upon the same mixture of public right and private right, although it arrives at it by a different road." And further: "It is not only feudalism, it is also the modern French royalty, and through it all European royalties, which, by virtue of the same principle, have contracted a debt of gratitude to the Merovingian royalty. . . . The principle of the possession of public authority as private property dominates, even if more feebly, the constitutional law and political institutions of France until the great Revolution." The four books of which the work is composed, are followed by six appendices of considerable length, discussing in detail some of the controverted points contained in the treatise itself. There is a good table of contents, but no index. In conclusion, we would say that the special value of this important work consists: first, in the thoroughness with which the royal authority is shown to have been the controlling force in the early Merovingian period; secondly, in the emphasis placed upon the constitutional changes in the reign of Clotaire II.; while, thirdly, it contains perhaps the best compendious statement of the constitution and administrative system of the period in question.

Orthodoxy and Heresy in the Christian Church. By Edward H. Hall. Boston: American Unitarian Association.

UNDER this title the pastor of the First Parish Church in Cambridge, Mass., has published a series of lectures delivered by him some ten years ago before his parish in Worcester. They are, in brief, a sketch of the history of Christian doctrines, so planned as to keep before the mind of the reader the constant distinction between the accepted dogma of the Church and those divergent streams of thought which can be grouped under no other name than "heresy." The main thought which pervades them all is that the term "orthodox," far from having any single or definite meaning, has required constantly to be redefined and reasserted, and that in this process of definition it has suffered an equally certain process of change, so that the heretics of one age have become the self-constituted orthodox of the next. This is no new thought, but it is one which cannot be too often recalled to the consciousness of the world. It has seldom been presented with greater force and clearness than in this little book. Those who have not the time or the learning to follow out these studies for themselves can find here, in admirable style, within small compass, and in terms so simple that they cannot be misunderstood, the essentials of the story of that great process by which the doctrines of the Christian Church have been developed. They can learn, what a lifetime of church-going or the reading of many larger books might fail to teach them, that these formulations of belief have been the result of human struggle, and not of divine revelation. They may trace here the working of some of the lowest human motives—ambition for place, the violence of power, the wanton disregard of the sacred right of argument—all combining to settle as authoritative certain declarations of belief which then claimed for themselves the name of orthodoxy. On the other hand, they may learn how much of divine courage, patience, and tenacity of purpose were called forth in the service of those efforts after new and higher truth which have come down in official records as heresy.

These principles are fundamental. There can be no true study of the Christian records until the human character of the struggles by which the doctrines were formulated is clearly understood and frankly admitted. Without this admission all thought upon the subject must be indistinct and unsatisfying. The author's gift for clear and vigorous statement, his wide and deep learning, and his truly catholic sympathy with every effort of the human mind to work its way out into the light on these dark questions, fit him admirably for this work. It will be a matter of regret to every lover of truth if this little book shall prove not to be an introduction to a more detailed development of the same theme. It is only to be regretted that it bears the imprint of a denominational publishing-house, which cannot fail to limit its possible usefulness.

Ursachen der Amerikanischen Concurrenz. Ergebnisse einer Studienreise durch die Vereinigten-Staaten, von Dr. R. Meyer. Berlin: Hermann Bahr. 1883. 8vo, pp. 825.

A VERY full and flattering account of this country is given in the report made by Dr. R. Meyer of his visit here in 1881, under the title of 'Causes of American Competition: Results of a Tour of Investigation through the United States.' The author deals with the great industrial problems that are being rapidly solved on this side the Atlantic, and points out the lessons to be learned by European economists. The condition of the emigrants in America; the agricultural census returns; grain-elevators and other economical appliances for handling and moving crops; freights by rail and water; the great business in cattle in all its branches and localities: the coal and other mineral resources of the country, are the general subjects, and then come the personal observations made in Washington, the South, the West and Canada. These are accompanied by special studies of the German "Adelsverein" (Noblemen's Union settlement) in Texas, of the American public-lands system, of the work of the Department of Agriculture, of the vexed questions as to transportation across the continent, of education, and of such other topics as particularly interested the author and his companions —a little group of Austrian noblemen, who, being owners of large properties in outlying districts of the Austro-Hungarian Empire, were close observers.

Almost their first note is important, and that is, the immense superiority of the actual living of all classes in this country, and especially of workingmen, over that of all European countries. This it is that enables the foreigner here as well as the American to do so much more work than what passes for a day's labor on the other side of the Atlantic. Swiss and Germans have, as a rule, as good an elementary education as Americans, while the French, Italians, and Austrians of the same peasant class are much more ignorant than any of the others; but the American has been well fed, well clothed, well housed, and is busy learning one trade or another, while the foreigner has lost the best years of his youth in the unprofitable business of soldiering, and comes out of his compulsory service full of anxiety to get away from a country that exacts so great a sacrifice of time and strength and makes so little return for it. As far back as 1873, Doctor Meyer pointed out, in the Berlin *Review*, the rapid approach of American competition as a decisive factor in the social and economical struggles of European countries. In Castle Garden he takes up his old theoretical studies, and illustrates them by the practical examples he there finds of the care shown by

American industrial agencies for the future wealth-producing emigrant.

Doctor Meyer thinks that in fifteen years American industry will be able to flourish without any tariff to protect it, and then it will flood Europe with the products of its machinery and its cheap coal and water power. The problem of transporting enormous crops cheaply from the producer to the consumer is being solved every day in America, which furnishes proof of the economy of having one great channel for trade instead of a hundred little streams. Hungary has surrendered much of its market to that of America, because the one country handles its produce on a great scale cheaply, and the other still depends on little dealers, who go from farm to farm and make petty bargains. The American farmer knows from day to day the price of each item of his crop, and he banks upon his harvest, finding in the elevator companies and the warehouse receipts a cheap and easy means of raising money when he has security for it. The European farmer, on the contrary, goes to the Land and Mortgage Bank only in his bad years, and in his good years he spends his surplus in adding to or improving his property. When trouble comes, therefore, he has no reserve or resources. In America there are thousands of national banks in which the farmers are shareholders and depositors, while in every German neighborhood there is a great land bank which gradually becomes the owner of the farms and estates within reach. The competition of the rival railroads and of river transportation is of incalculable advantage to the American farmer, who has both a local and a foreign demand for his produce utterly unknown to the European, especially the Austrian, Hungarian, and Russian grain-growers.

The mechanical appliances in use on the Western plains, at the great ports, and in both railroad and shipping facilities for handling great masses cheaply and rapidly, are described by Doctor Meyer in detail, as well worth the attention of the foreign merchant. The much-discussed question of sales by sample or by mark is examined with exhaustive historical research, and the American custom is approved on the grounds of expediency and experience. "Graded" wheat, "inspected" pork, flour "brands," are all modern applications of a rule which dates from mediæval guilds, and has been reduced in America to an exactness quite unknown abroad. Doctor Meyer suggests that foreign governments would do well to have experts at every American port to keep watch and make instant report of all mechanical appliances and improvements that can be used to advantage in reducing the expense and improving the condition of their own crops, and he says that his Hungarian fellow-travellers mean to introduce at home much of what they saw in their journey. He also contrasts the steady diminution of freights, by reason of increasing competition by the great carrier companies, with the imperial German legislation of 1873 providing for a gradual increase in railroad rates of nearly one-third. This, he says, is an indirect tax highly injurious to German industry, and in the teeth of the great demand for cheap food for the laboring classes.

Since the publication of 'Le Blé' by Ronan in 1878, and its translation, with some additions, by Doctor Max Wirth in Berlin in 1880, there has been no such careful analysis of the cost of transportation of American produce to Europe. This Doctor Meyer attempts in his sixth chapter, with a description of the new routes opened since the others wrote. The free canals, the additional collecting points in the West, the new steamer lines from the South, the growing surplus for exportation on the Pacific slope, the work of the railroad commissions, the last tariff changes as a means of securing return freights, the prospect of a canal across the Isthmus of Panama, the immediate opening of the Northern Pacific Railroad, the conditions under which the East and the West compete for the supply of the foreign demand—all these topics are exhaustively studied. Then comes a discussion of the doctrine so often mooted abroad, that the soil in America is being exhausted; and against this Doctor Meyer points to the increased value of the products of the Middle States, where agriculture, after a hundred years and more, has found new crops and new methods of enriching the soil. The success in opening the mouth of the Mississippi is making that river the great lever by which railroad pools and rates are to be kept favorable to the producer and the consumer, with just profit enough left the transporter to enable him to live too. This is shown to be much more effective than Granger laws, which are fully explained, and the agitation that produced them as sovereign remedies is described at length, together with its good and bad results. A statement is given of the operations of the great wheat growers of the West, the famous Dalrymple Farms being taken as a type illustrating the economies in the growth of crops and in handling them, with the advantages freely conceded to a producer that can get express trains and own or charter whole fleets on the lakes and fill up all the holds of ocean steamers, and thus make a profit in spite of high rates and low prices.

The book is full of lessons of interest to readers on this side the Atlantic. It will well repay careful examination and intelligent criticism.

BOOKS OF THE WEEK.

Alphabet Children. White, Stokes & Allen. $1.
Apples of Sodom: a Story of Mormon Life. Cleveland: Wm. W. Williams.
Bacon, Rev. L. W., and Allen, N. H. The Hymns of Martin Luther, set to their Original Melodies. Chas. Scribner's Sons. $2.
Barrows, W. Oregon: the Struggle for Possession. [American Commonwealths.] Boston: Houghton, Mifflin & Co. $1 25.
Bonner, J. H. Whispering Pines: Poems. Brentano Bros.
Braddon, M. E. Under the Red Flag. Harper's Franklin Square Library. 10 cents.
Bruce, Rev. A. B. The Parabolic Teaching of Christ. A. C. Armstrong & Son. $2 50.
Butterworth, H. Zigzag Journeys in Northern Lands. Boston: Estes & Lauriat. $1 75.
Fisher, Prof. G. P. The Reformation. New ed. Chas. Scribner's Sons. $2 50.
Cable, G. W. Grandissimes: a Story of Creole Life. Charles Scribner's Sons. $1 25.
Chatterbox, Junior. R. Worthington. $1 25.
Classified and Descriptive Directory to the Charitable and Beneficent Societies and Institutions of the City of New York. G. P. Putnam's Sons. 75 cents.
Clement, Clara E. An Outline History of Painting, for Young People and Students. White, Stokes & Allen. $2 50.
Coolidge, Susan. A Round Dozen. Boston: Roberts Bros. $1 50.

NEW YORK, THURSDAY, NOVEMBER 29, 1883.

The Week.

THE official figures of the total vote in this State at the last election show, as we anticipated that they would, a falling off from the vote of last year. The whole number of votes cast for all candidates this year was 901,950, against 915.539 in 1882. Curiously enough, the combined Democratic and Republican totals for both years are nearly the same. That for Folger and Cleveland was 877,782, and that for Carr and Maynard is 873,950. Last year the Prohibition vote was 25,783, and this year it is only 17,000, while the Greenback vote was about 11,000 in both years. This indicates that many Republicans who did not wish to vote for Folger last year voted for the Prohibition candidates rather than vote for a Democrat. Carr's vote this year was 446,384, about 18,000 greater than that cast for any other Republican candidate, and about equal to the average vote cast for the Democratic candidates. He undoubtedly owes his election to the votes of 18,000 or more Democrats, who refused to support Maynard because of his temperance principles. Carr's vote is 103,920 greater than that cast for Folger. The lowest candidate on the Republican ticket received 84,234 more votes than Folger had. The candidate on the Democratic ticket who received the largest vote was Maxwell, who had 447,269 votes. This is 88,049 less votes than Cleveland had, and over 3,000 less than half of the total vote cast. It is interesting to note that the Republican increase of 84,234 over Folger's vote is nearly the same as the Democratic decrease of 88,049 from Cleveland's vote. Here is a shifting vote of from 80,000 to 85,000, which probably measures pretty accurately the size of the Independent vote in the State. That is the vote which will decide the Presidential election of next year, and its formidable proportions are likely to have a most salutary effect upon the nominations of both parties.

The final week of the Speakership contest opens with Mr. Randall clearly in the lead. Congress will assemble on Monday next, and in the opinion of the best judges Mr. Randall's election will speedily follow. The other candidates make energetic claims of strength, but it is very plain that their hopes are slight. An overwhelming majority of Democrats everywhere are afraid of reopening the tariff issue on the eve of a Presidential election, and this fear is likely to be powerful enough to put Mr. Randall into the chair. Here and there a Democrat supports him openly because he is a protectionist. Thus Congressman Arnot, of the XXIXth New York District, said on Sunday: "I am a protectionist and will vote for Randall for Speaker. I don't want any half and half in this particular, for I have too solid a respect for a protective tariff. I am an out-and-outer, and that is the kind of a man I shall favor for Speaker." There is no doubt about Mr. Randall being that kind of a man. His position in favor of the total abolition of internal taxes would of itself demonstrate that.

Judge Barrett has been giving to the public his views as to divorce, and declares that he is totally opposed to a constitutional amendment giving Congress power to secure a uniform system of marriage and divorce. His only objection is the "entering wedge" argument—that it would lead to centralization. Why, he says, should we not have a "uniform murder law?" Why should not crimes and the domestic relations in general—of parent and child, guardian and ward—be handed over to the Federal Government? As we originally brought the matter up for discussion in these columns, we may take it upon ourselves to reply: Because the country does not suffer from the lack of a uniform law on any of these subjects. As a man who commits a murder, or any other crime, is necessarily tried by the State where it is committed, and as the Constitution compels any State in which he takes refuge to surrender him for trial and punishment, no inconvenience is felt in the existing system. So the local regulation of the domestic relations produces no trouble, except in the case of husband and wife. Now with regard to this, a very great proportion of the divorces procured are notoriously got in defiance of the law of the State where the parties actually live, by resorting to some other State where the law is more lax. This branch of the evil would be brought to an end by a uniform Federal system; and it would no more be a "wedge" than a bankruptcy law, or a copyright law, or a patent law, can be called so. There is no principle in the Constitution that we know of that prevents the transfer of any matter to Congress with which experience shows that the States are incapable of dealing, by means of an amendment. To enable the country to make changes of this sort we have always supposed to be one of the principal reasons for permitting amendments.

A case has arisen under the new California Constitution which brings the right of private property again before the Supreme Court. If anybody doubted that the Granger decisions struck a serious blow at the commonly received ideas on the subject, their doubts would be removed by the general tone of the discussion in this case. The question is as to the right to control "rates" charged by a San Francisco Water Company—in other words, the price of water. One of the arguments used against the company was, that there was no such thing as private property in water, and this appears to have been gravely argued on both sides. One of the strangest legal results of the Granger movement is that it seems to have identified, in a great many publicists' minds, the right to fix reasonable rates with the right to confiscate property. The fact that the State must in some cases fix rates, does not make it any the more advisable to destroy the value of stock in a corporation which it charters in order to enable it to make money. If the right to fix rates is such a grand thing as its advocates would have us believe, it is a pity that the argument upon which it rests should lead to so much general confusion between *meum* and *tuum*.

The best that can be said about the condition and prospects of that great representative line of industry embraced in what is called the "iron trade," is that the depression does not increase. Some furnaces are being blown out, their owners declaring that the prices of iron are below the cost of production, while others are just starting up. But in the lumber, glass, and paper industries there are less favorable prospects. It is believed that the low prices of lumber have caused the loss of the entire capital of a good many producers in the Northwest. In the paper trade, the condition of things is indicated by the fact that last week fifty mills, in what is known as the "Northwestern Paper Pool," resolved to close their mills from December 1 to February 4. In the glass trade there has been an extensive strike at Pittsburgh, and a good many manufacturers will close their works. Concurrent with these unfavorable symptoms, speculation in grain has been revived by the reports that the corn crop will turn out only from 1,200,000,000 to 1,300,000,000 bushels, instead of more than 1,600,000,000, as indicated by the Agricultural Bureau. At the same time the export movement of breadstuffs and cotton is from 22 to 25 per cent. less than at the corresponding time last year; consequently the imports of specie are as yet on a very limited scale, the total for last week being $558,600. The only positively favorable feature in the entire commercial and industrial situation is the continued large earnings of the railroads, which are, on the average, sixteen per cent. greater thus far in November than at the same time last year. Nevertheless, capital still retains a sluggish and somewhat distrustful attitude. There has been some active investment in railroad bonds in the last month, which has advanced the prices of the best stock from 1½ to 2½ per cent.; but the dividend-paying railway stocks seem to attract no considerable investment of capital yet, and in the last week they have all declined from 1½ to 3 per cent. The amount of idle money in the banks increases, and rates of interest are lower than ever before at this season of the year.

The depressed condition of the dry goods industry has been illustrated in no more remarkable way than by the fact that a Chicago clothing firm has found it necessary to engage Sergeant Mason, at a salary of $125 a month, to push their business. The Sergeant's knowledge of the clothing business is

limited, but the firm think that his popularity through his attempted murder of Guiteau will draw custom. He has also received an offer of a theatrical engagement, but this he has refused, for the singular reason that he has no desire to "make a show" of himself. Sergeant Mason is a remarkable product of a remarkable period. He declares that it was wrong to imprison him, because he missed Guiteau, and thinks that a jury would have acquitted him on that account. This is evidently founded on an erroneous view of the jury system. Had he been acquitted, it would have been not because he missed Guiteau, but because he tried to kill him.

After the experience in Fifth Avenue on Monday evening there is no necessity for further expert testimony concerning the danger from electric-lighting wires. A runaway in the avenue broke down one of the electric-lamp poles and trailed the wire upon the pavement. A passing horse stepped upon the wire; there was a flash of purple light, a report like a pistol shot, all the lights on the avenue went out, and the horse fell dead. A moment later another horse stepped upon the wire and dropped dead like the first. The avenue was immediately closed to travellers of all kinds. Of course if a person had stepped upon the wire he would have shared the fate of the horses. It was a stormy night and there were few people upon the avenue, or the consequences might have been much more serious. A wire which kills instantly every person who treads upon it would be a deadly thing for a crowd to surge over. Clearly the only safe place for these wires is under ground, and the sooner they are put there the better.

At the Sweet Springs in West Virginia the other day, Carey Woodville had to beat Shelt Harman for poisoning two dogs, and his brother, James Woodville, had to stand by with a shot-gun to see fair play. Shelt Harman, however, objected to being beaten, and tried to hit Carey on the head with a stone, to prevent which James Woodville interfered. For this another bystander named Carter attacked James with a broad-axe, so James shot him in the leg. Then Harman attacked James also, and then James shot him. Then Carter's father also attacked James with an axe and James shot him. Whereupon old man Carter ran away, apparently through fear, but really, he says, simply to bring more men to take part in the fight. Thinking there were more coming, James ran away, too, not through fear, but feeling, he said, "that as others were called he had better go away quickly or he certainly would kill somebody." Great praise is accorded by local opinion to James, who is a fine marksman, for only shooting his opponents in the legs, for he might have killed them; and it is thought that this magnanimity on his part will lead to his acquittal by the jury. The real culprit in the affair seems to be Shelt Harman, who refused to take his beating quietly.

Frank James, who is lying in jail in Missouri, is said to be in "very low health," and besides this his money has given out, while his "surroundings" are by no means what they were a year ago. At that time his place of imprisonment seems to have been more like some luxurious chamber out of one of Disraeli's novels than an ordinary cell. There were Brussels carpet on the floor, "paintings and bric-à-brac" on the walls; a mahogany bedstead; a writing desk, and a little collection of his favorite books—fiction, probably of a pretty stirring kind. Now he has a pine board for a table, two rough bunks, and two stools. In fact, he has come down from the level of a state criminal to that of an ordinary murderer. The reporters are trying to revive the interest in him by telling romantic stories about his wife, who, with her husband, is fond of "chatting sociably" over the days of their courtship, with any one who likes to come in and listen; but it seems to be hard work.

The attitude of the English newspapers toward "interviews" is a curiously contradictory one. When interviewing began to be a regular enterprise a few years ago, the English leader-writers denounced it as the most dreadful form which American impertinence had yet assumed. They continue to denounce it in much the same terms now, but, strangely enough, they ignore the actual presence of the interview in their own columns. All the leading London papers employ American correspondents who send daily despatches concerning all important American events, and their longest despatches are nearly always interviews with illustrious Englishmen who are visiting this country. It has frequently happened that a London journal has contained on the same day a leading article denouncing interviewing, and a column cable message, costing several hundred dollars, which was an interview pure and simple. When Herbert Spencer was here the same London journal which published conspicuously a long cable message giving the substance of an interview with him, also published a "scathing" leader condemning the irrepressible impertinence with which Mr. Spencer had been worried during his entire visit to America, until he had been forced to give his views in order to obtain peace. The facts in the case were that instead of being worried into an interview, Mr. Spencer prepared it himself and sent it through a friend to all the New York newspapers for simultaneous publication. Other English visitors have taken to the interviewing system with equal favor, and their observations thus published have been promptly transmitted to London by cable at the cost of 12½ cents a word. Those which have not been sent by cable have been copied from the New York papers as soon as the mails arrived in London

---

Mr. Roger A. Pryor, who was sent over, at considerable expense, to take part in the defence of O'Donnell, has definitively concluded not to attempt to appear in court on his behalf, having probably ascertained that he would not be permitted to speak. This will be a very bitter disappointment to a large number of those who contributed the money to pay his expenses, because what they sought was not so much to get O'Donnell acquitted as to "make the coort ring" with a denunciation of British tyranny and perfidy. As Mr. Pryor cannot furnish this he ought to come home or to return the money. His legal opinion or advice will not be of any particular value to O'Donnell, as he is not a remarkably prominent member of the bar here, and cannot offer any help over there which is not abundantly supplied by members of the English bar. The truth is, however, that the contributions of the Irish in this country for all sorts of purposes connected with resistance to, or defiance of, the Government at home, are so large that the honest managers must now, as the Land Leaguers are not carrying on operations, be often greatly puzzled to know what to do with the money. Dishonest ones are, course, never in any difficulty. The favorite mode of disposing of it seems to be sending people to Europe to make a disturbance of some kind.

Things do not look any more peaceful in Tonquin. The Chinese are apparently amusing the French with "fresh proposals." The circular which their Government has addressed to foreign Powers indicates clearly that China means to fight, and that the fight will probably be brought on by the French attack on Sontay and Bacninh, which are garrisoned, in part at least, by Chinese troops. We may any day now hear news of the outbreak of hostilities by the opening of the French attack, which will be rendered more interesting, in all probability, to European Powers by a bombardment of Canton at long range. Admiral Courbet is supporting the Ministry at home by refusing to ask for further reinforcements. His land force does not exceed ten thousand men, which could be increased slightly by sailors and marines. About the number of Chinese regulars who are disciplined and armed in the European fashion, there is a great variety of reports, but the highest estimate does not put them at over fifty thousand. What their discipline amounts to, there is as yet little means of judging, as they have hitherto been only employed against native rebels. But that they have all the natural qualities of good soldiers is beyond question. They are temperate, hardy, patient, obedient, and if the small value they place on their own lives can be turned to account for military purposes by good officers, they will certainly make a very formidable army. There are rumors, as is usual in such cases, of their having a considerable number of European and American officers. But this story is now told of every barbarous army engaged in a conflict with a civilized Power.

It is difficult to understand on what principle of law the British Government can seriously object to the French blockade of the Chinese ports. France, undoubtedly, has the usual belligerent right of establishing an effective blockade of any ports she pleases; what England now appears to be doing is objecting to her trying to establish an effective blockade, on the ground that she cer-

tainly could not succeed. That, however, can hardly be considered sufficient ground in the forum of international law. Every Power has the right to try to make an effective blockade, France, of course, as well as any other. The real English objection is that even the attempt would seriously interfere with English trade, and would excite so much discontent among English manufacturers and shippers that the Government could not avoid interfering, or, in other words, taking the Chinese side of the quarrel. The truth is, that a blockade will hardly hurt the Chinese at all. They care very little about foreign trade, and the total loss of it would not bring much perceptible pressure to bear on the Government in favor of peace. Two-thirds of the export of China consists of tea, which would somehow or other, under all circumstances, find its way out of the Empire. But the imports are mainly cotton and woollen goods and opium, which a blockade would largely exclude. Moreover, the entrance and clearing of vessels from Hong Kong would be greatly impeded by the blockade of the adjoining harbor of Canton. The French are said to be so much impressed by these considerations that they are going to confine their operations to the Tonquin waters.

While Herr Beheim-Schwarzbach, in a recent number of the Berlin *Gegenwart*, effectively disposed of the colonization schemes which, in spite of the vote of the Reichstag on the Samoan question, are being urged in Germany, French defenders of the opening of "commercial outlets" are increasing in number. The most prominent of these is M. Gabriel Charmes, of the *Journal des Débats*, who, in the latest number of the *Revue des Deux Mondes*, has an interesting article on the Colonial Policy of France. He sees in the present policy but the continuation of long-established French traditions, and thinks that France can still best employ her large surplus capital in developing her colonies, which offer so large a field to her industrial ingenuity. He is, however, candid enough to admit the existence of various obstacles in the way of successful colonization—viz: the vagaries of internal politics, which, by fostering State Socialism, so augment the price of labor as to exclude French manufactures from foreign markets; the failure to negotiate a treaty of commerce with England; the rigor of the conscription laws, which prevent young men from acquiring a thorough mercantile education by a residence abroad; and, lastly, the management of colonial affairs by incompetent politicians. M. Charmes's article is chiefly remarkable for the emphasis with which, in contrast to the chauvinism of even so clear-headed a writer as Leroy-Beaulieu, he dwells on the benefits accruing to France from the influx of foreign elements. "Our history shows," he says, "with what ease we assimilate foreigners, and of what service they are to us when once assimilated." The Paris correspondent of the *Frankfurter Zeitung*, in commenting on these remarks, admits, perhaps not altogether disinterestedly, the validity of the argument which sees a national gain in the dissemination of French culture regardless of economic considerations. At the same time he takes occasion to remind his compatriots how prone they are to attach undue importance to the anti-German utterances of obscure journals, while not only ignoring the contrary voices of such men as Gabriel Charmes, but also the actual facts with regard to the "persecutions" of Germans in Paris, of which German papers never tire, and which he pronounces altogether mythical.

One of the most active and useful of those taking part in the agitation in London for the improvement of the dwellings of the poor, Mr. Sims, writing in the *Daily News* with full knowledge of his subject, says, with regard to a large body of those whose lodgings excite the most horror and compassion, that they are so degraded in their habits and in their intelligence that any habitation into which you could put them would soon become vile and loathsome. In fact, he has apparently very little hope of any solid or radical change for the better in the population of East London except through the education of children—a feeling which is, we believe, very common among those who labor among the degraded poor in any large city. One other striking and significant incident of the agitation occurred the other day at a meeting called by Mr. Torrence, who is one of its principal promoters. He recommended emigration as the best remedy for the sores of East London life, but he was cried or hissed down by his audience, who said it was the landed proprietors and capitalists who ought to emigrate. When he talked of the poor, they shouted to him that there ought not to be any poor. Finally, the opposition took possession of the meeting and passed resolutions condemning emigration and demanding the opening of public works by the state, and the colonization of England itself, by which one orator explained that he meant the nationalization of the land as the sole remedy for pauperism.

Why the election of the Rector of St. Andrews by the votes of the students should ever have become an important event, and success in it a distinction which public men covet, it is hard to see, but the fact remains that some of the greatest men in English literature and politics have been competitors for the place and have been glad to get it. Mr. Lowell's success, therefore, achieved as it has been over a distinguished Conservative politician and the ablest speaker of his party in the House of Commons, must be considered a high compliment both to him personally and to American literature. The election serves the excellent purpose of drawing out a carefully prepared address on some literary or political topic from the Rector on his inauguration, and thus furnishes the public with what is usually one of the greatest treats of the year in the way of literary or oratorical performance. The occasion is one on which Mr. Lowell is well fitted to shine, and that he will shine there is no doubt.

The news of Hicks Pasha's defeat continues strongly to impress the English imagination and appears to be causing a real Jingo fever. No deduction from it seems too wild. The *Spectator*, which has always been fond of signs and wonders, believes that the False Prophet's victory is going to set the whole East on fire. "Either," it says, "we misread the Arabs altogether, or in a month the French will be fighting for their lives from Gabes to Morocco." It is very easy to misread the Arabs, however, when one is sitting in London—far easier than to make the French fight for their lives from Gabes to Morocco; and it is safe to predict that the French, a month hence, will be no worse off than they were a month ago. The *Tribune's* old Tory squire, who is as loyal as the Groom of the Stole, we need hardly say, is also full of fight, and sternly rebukes the Radicals and the *Daily News* for their "incredible flippancy in trying to minimize the effect of El Mahdi's victory." If Gladstone does not do his duty in the matter it would not be surprising if the gallant old fellow were to tackle the False Prophet himself.

The most trustworthy account of the condition of Hicks Pasha's force before he started on his expedition is contained in a letter from Major Seckendorf, of the German army, who was with him. The letter was a private one, apparently, and has just appeared in the Vienna *Presse*, from which the contents have been cabled. Hicks Pasha, he says, had only ten thousand men and an enormous baggage train, and not cavalry enough for outpost duty. This deficiency in cavalry he evidently thought likely to work the ruin of the expedition. To the False Prophet he gives fifteen thousand breech-loading rifles, fourteen guns, and a numerous and excellent cavalry. These, in a waterless desert, would have been sufficient to work Hicks's ruin in the long run. His fate, however, seems to have been precipitated by the treachery of a guide, who took him into a defile, where he was soon disposed of. Major Seckendorf thought this victory, if won, would satisfy the natives that the False Prophet was the Messiah and would give him the whole country. The *Daily News* is the only London paper which seems to take a rational view of the disaster by declaring that it ought to teach the Khedive the folly of fighting the False Prophet up in the Sudan. The true policy for Egypt in the present state of its finances and its army is to let the False Prophet alone as long as he is content to stay where he is. There is no place in which a False Prophet can do less harm than around the head waters of the Nile.

General Loring, who was long in the Egyptian service, has had an interview with a *Herald* reporter, in which he confirms our belief when the news of the Egyptian disaster first arrived, that the False Prophet's army was largely made up of exasperated slave-traders, and that his resistance owes most of its force to the determination of slave-traders not to be put down. The notion that there is enough Mussulman fanaticism left anywhere in the East to produce a formidable movement is a chimera. Whenever during the last forty years this fanaticism has been tested for warlike purposes it has been found all but dead. It is undoubtedly useful in giving glow and animation to editorial articles, but for little else.

THE EGYPTIAN DISASTER.

History repeats itself with astonishing rapidity in Egyptian affairs, and to one who has closely watched the march of events during the past decade, the similarity of recent occurrences to those of a few years past must appear marvellously striking. But a few days ago news came that Commander Moncrieff and a contingent of Egyptian troops numbering several hundreds had been destroyed in the immediate vicinity of Suakim. Now, the startling intelligence comes from Khartum that the large force under Hicks Pasha, which was intended to put down El Mahdi, the False Prophet, and restore the Sudan to Egypt—that this force, numbering more than ten thousand men, has been utterly annihilated. Let the reader turn back to the record of events in 1875 and 1876, and hunt up the accounts of the operations of the Egyptians against King John of Abyssinia. Let him read again of the massacre of Munzinger Pasha and his little army of 600, in the vicinity of Tajurrah. Let him note how Munzinger landed at an Egyptian port, marched into the country of the Gallas, so confident of being master of the situation that he even took his wife with him; and how, when a few miles in the interior, near Lake Assal, he was betrayed by his guide, he and his wife killed in their tent, and his force wiped out of existence, with the exception of a few soldiers and one staff officer, who returned, wounded and bleeding, to tell the dreadful tale. This happened in the early part of November, 1875. During the same time a larger expedition was marching into Abyssinia from Massowah. This latter force, numbering between three and four thousand men, splendidly armed with Remington rifles, mountain howitzers, and rockets, and well appointed in every respect, under an officer of the Danish army, Col. Arendrup, seemed for a time to be having everything its own way. It marched nearly one hundred miles from its base of operations; its enemy seemed to melt before its advance, some tribes becoming friends and allies, and others retreating into their mountain fastnesses. But on the 20th of November, 1875 (mark the date), news came to Cairo that Col. Arendrup was betrayed by his allies in a narrow defile near the Mareb River, and butchered with his force almost to a man.

The similarity between these two disasters and those which have so recently shocked the sensibilities of the civilized world must strike every one. As we hear more and more about the Moncrieff and Hicks Pasha massacres we shall probably trace still other and more sickening similitudes. The meagre details of the battle of El Obeid which have reached us up to this writing, represent Hicks Pasha as having been surrounded, in a very bad position, by a great host of barbarians numbering between two and three hundred thousand; that his army of ten thousand Egyptians fought desperately for three days, but at last, overcome by heat, thirst, superior numbers, and *their square being broken*, succumbed, and were ruthlessly slaughtered by their savage and fanatical foes. Now such exactly were the accounts first given of the Arendrup defeat. But an Englishman who happened to be with King John's forces on that occasion, subsequently published a description of the battle of the Mareb, and stated that the Egyptians did not fight at all, with but very few exceptions. The loss inflicted by them upon the Abyssinians was utterly insignificant. Col. Arendrup defended his own person with sword and pistol until hewn down and hacked to pieces; and Count Zecchi, an Italian who was acting as aide-de-camp, shared the same fate. A few of the Turkish officers, and a very small handful of the soldiery, showed manliness enough to resist, being cut to pieces by the rude swords and spears of the Abyssinians; but the great mass of the Egyptian troops were too cowardly to fight and too stupid to run. Such, we fear, will be the true history of the massacre of Hicks Pasha and his 10,000 Egyptians. Such, certainly, was the history of the great Abyssinian expedition under Ratib Pasha, which went with 20,000 men to avenge Arendrup, and had its termination in the inglorious battle of Gura.

Now the question very naturally arises, why is it that the Egyptian soldiery has, of late, at least, been invariably beaten by every foe? That they should not be a match for the trained and tried troops of England, is not a matter of surprise, but that they are utterly unable to cope even with the naked, unarmed, barbarous tribes of blacks which surround them, is truly remarkable. And, in view of the possibility that Lower Egypt may be invaded by the Mahdi and his followers, it is very important that the question, "Will the Egyptian fight?" or "Can he fight?" should be speedily and definitively settled.

The maxim in the art of war that good officers make good soldiers, seems to be completely set at naught by the Egyptian troops. As a matter of fact, it does seem that the Egyptians are utterly lacking in the prime quality of real soldiers, namely, the *fighting quality*. Drill alone will not give this quality, discipline will not impart it. Even courage alone is not by any means its equivalent. It is superior to courage, to drill and to discipline, in the stern struggle for life of actual battle. It is a combination of combativeness, self-reliance, independence, vindictiveness, revengefulness, pride, and numerous other qualities which some might call the more brutal parts of our nature. This fighting quality is almost wholly wanting in women, though some of them are gifted with courage of the loftiest order. It is, however, a part of the nature of a free-born man. Nothing but long continuance of slavery and degradation can wholly eradicate it from a whole people. Have not the Egyptians lost this quality under the long rule of their beys and pashas, under the *corvée* labor system of their Khedives; under the coorbash of their tax-gatherers; under the chains and handcuffs of their recruiting sergeants; under the kicks and blows and abuse of their superiors for so many long generations? An affirmative answer to this question seems to be the only satisfactory explanation of their many recent military disasters, including the latest.

Hicks's defeat was foreshadowed very clearly by the latest despatches of Mr. O'Donovan to the *Daily News* just before the expedition started. It was about to plunge into the desert—or what for an army would be the same thing as a desert—in small force, with scanty supplies, and with troops broken down by bad food and an enervating climate. It had hardly any cavalry too, and consequently can have been but very ill informed as to the whereabouts of the enemy. The False Prophet has always been strong in cavalry, as Arabian prophets usually are, and he had only to compel Hicks to perform the one tactical manœuvre of which his troops were capable, that is, to form in square, and then to keep him in square for two or three days until his men were worn out, in order to have him at his mercy. The whole affair simply illustrates the folly of the attempt (which Ismail Pasha originated), on the part of such a country as Egypt, to annex and hold a region like Sudan. It is, except the few hundred yards along the banks of the Nile, a howling waste with a terrible climate. From the very beginning the Egyptian troops have looked on it as a penal settlement, and on an order to go there almost as a sentence of death. When Arabi Bey found some Circassian colonels guilty of conspiring against him he sentenced them to service on the White Nile, and it was treated as an act of great barbarity. We may imagine, therefore, with what feelings the remnant of Arabi's army, after his defeat, went up there to chase the False Prophet under Hicks Pasha.

It must be said, however, that the Egyptians are not wholly to blame for the annexation. Ever since Sir Samuel Baker explored the upper Nile fourteen or fifteen years ago, the duty of suppressing the slave trade, of which Khartum is the great centre, has been impressed upon the Egyptian Government in the strongest terms, both by politicians and philanthropists, and it was under this stimulation that the attempt at real annexation was made. Sir Samuel Baker himself tried his hand at it in command of an Egyptian force and was not particularly successful. Those who have followed him have fared no better—Hicks Pasha worse than any. As long as the troops keep to the Nile all goes well, but they cannot catch the slave-traders by keeping to the Nile. As soon as they go after them into the interior their great difficulty is to keep alive. The proportion of the False Prophet's army which consists of religious fanatics is probably small and contemptible, but he has been undoubtedly reinforced by large bodies of Mussulman slave traders, who are the "bosses" of that region. They all command a small force, with which they make their raids on the negroes further south, are rich, influential, inured to long marches, and capable of doing excellent service as irregulars. They have now probably combined to get rid of the Egyptian pest which has so long been interfering with their traffic by breaking up their markets in the large towns. It is extremely doubtful whether there is any power in the world which can accomplish in

Sudan what Hicks undertook. There are no white troops which could stand a campaign there. There is not, as there was in Central Asia when the Russians invaded it, any government or political organization the overthrow of which would deliver the country into the hands of the invader. The best that can be accomplished by way of suppressing the slave trade is the holding of the large towns on the river with garrisons sufficiently large to take care of themselves, to prevent the opening of slave markets.

RELIGIOUS STATISTICS.

THE broken victuals left over from the "Symposium" of the *North American Review*, given last summer on the question of the decadence of Christianity in our country, have furnished forth lunches, of varying degrees of coldness, in the columns of several periodicals. No doubt the most forcible presentation of the case, from the standpoint of those who deny that the church is losing her hold, is the appeal to statistics made by Dr. Ward in the discussion alluded to. The figures then adduced were chiefly based on the researches of Dr. Dorchester, in the "Problem of Religious Progress." In the *Independent* of Nov. 15, Dr. Ward presents compilations of his own, bringing the statistics down to date. The *Century* has contributed to the question the results of test inquiries made with a view of determining the religious position of the leading business men of several cities and towns. If the totals reached by these writers cannot be impeached, and if the inference drawn from the figures cannot be shown to be misleading, they have, certainly, made out an excellent case.

But there are several points at which these statistics are open to suspicion and attack. It is notorious that nearly every individual church, as well as every considerable denomination, has upon its records the names of many persons whom it reports as communicants, yet who have no right to be numbered among our distinctively Christian population. Some of them have lapsed from the faith and never show their faces inside a church, out of sheer indifference and unbelief. Others are non-resident, who may be dead, or agnostics, or members of other churches, for all that any one knows, and yet their names stand in the books year after year. How large a percentage is embraced in this class, it is impossible to say. It is well known, however, that one of the constantly recurring questions in ecclesiastical assemblies, which somehow never seem to get settled, is the question of how to go to work to "purge the rolls." The Dutch Reformed church tried it, last year, and came out with a considerable diminution in its membership, which, it is safe to say, other denominations would experience to an equal degree if they undertook to "purge." The New York *Observer* recently took the leaders of its own denomination to task for not setting about a reform of the Church statistics, boldly asserting that a very large percentage of the returned total membership of the Presbyterian church—nearly one-third, if memory serves—was merely "drifting." In addition to these misleading aspects of the statistics is to be noted the fact that in the totals are often embraced the communicants of foreign-mission churches, who are all counted in to swell the numbers of Christians in the United States.

These considerations serve to show that those who confidently point to the "facts" ought to exercise greater care in collecting their figures before they build so much upon them. But even granting the statistics to be all that is claimed for them, one of the confident and sweeping inferences based upon them, as well as one of the collateral hypotheses brought in to help out the argument, can be shown to rest upon an incomplete generalization. Here we must direct attention to a fact whose bearing has not been noticed in these discussions, the fact that the practice of admitting children to full membership in Protestant churches has come to be almost universal. Forty years ago it was an innovation, an exceptional thing. The Scotch have not not yet given up the old idea that it was all very well to make children attend church services and be filled with all fulness of the Westminster Catechism, but that to join the church and take the sacrament were things for serious and mature minds alone. With us all that is changed. A very considerable percentage of the membership of the so-called evangelical churches is made up of children under sixteen years. A writer in the *Evangelist* recently described a Presbyterian church in Troy, which made a practice of receiving into membership children of seven to nine years of age. Exact figures are, of course, unattainable, but no one conversant with the case will dispute that the practice is of recent date, or that large numbers of children are to be found among the communicants reported by the churches.

Let us now see how this fact vitiates an inference of Dr. Dorchester, in which he is followed by others. The inference is to the effect that American Protestantism has grown faster than the population. According to him the population has increased, since 1880, 9.4 fold, while Protestantism has increased 27.5 fold. Or, since 1850, the increase of the population has been 116 per cent., while the communicants of Protestant churches have gained 185 per cent. But in this comparison he entirely overlooks the fact we have referred to, that the churches now take into their membership elements which once they did not. The basis of comparison has changed. In 1800 there was one communicant to fourteen inhabitants, according to Dr. Dorchester; in 1880, one in five. But when we remember that the church has now taken in two or three of the fourteen who, if the lines were drawn as they once were, would still be numbered among the non-communicants, we see that the force of the exhibit is quite broken. With this inference also falls as unsound the common hypothesis that, in order to come at the total Protestant population, we must multiply the total communicants by four. "Three children and adherents to each communicant is not a large ratio," says the *Independent*. Thus the ten million and a half communicants are transformed into forty-two millions and a half Protestant population. The whole argument turns on this assumption, and it is tacitly assumed that the old order of things still rules, and that communicants mean adult communicants. With so many children within the church, why make so generous an estimate of those without? The United States Commissioner of Education, in his report for 1881, gives the total school population as fifteen and a half millions. The average "school age" is a little over fourteen years. Many children, under that age, are in the Protestant churches. Yet, making no allowance for these, the *Independent* needs at least twenty millions of children, all Protestant, to help out its estimate. It well says, we "must get at the census reports."

It would seem that it must be a very firm conviction that the figures depended upon have been made trustworthy by careful scrutiny and sifting, which could lead one to believe, in spite of all appearances to the contrary, that one in five of our population is a communicant member of a Protestant church. It surely verges on credulity to go further, and say that only a little over a million of all our inhabitants are to be classed as neither Catholic nor Protestant church members or adherents. This leads us to mention certain evidence that, however it may be with the wealthy classes, the poor, the working classes, are drifting away from the Protestant churches with alarming rapidity. Our modern apologists have departed from the position of Paul and Justin, and, unlike them, prove that their faith is not decaying by pointing to the many mighty, the many noble, the many wise, who are its adherents. Either they are wrong, or the Christian historians are who have taught us that the surest hold of a religion is upon the poor; that it mattered not if the luxurious Roman nobles rejected and scorned the religion of Jesus, as long as it was finding a home in the hearts of the great masses of the poor; that the Reformation failed in Spain, where it had many champions among the rich and cultured, and succeeded in Germany largely because it won the support of men like Luther, though peasants. Here is the greatest weakness of American Protestantism. Either by increase of luxury or by loss of earnest belief, it is getting further and further away from the life of the poor.

We can but indicate the lines of proof of this assertion. Only the merest fraction of this great influx of foreigners is reached. There are, probably, 20,000 Bohemians in the city of Chicago alone, and it is not known that a single Protestant mission has been established among them. Part of them are Catholics, after a fashion, the most are agnostics, atheists, or what you please. The fantastic methods of the Salvation Army are tolerated, even endorsed, by leading Protestants, for one reason, and only one—the hope that in some way the poor of our cities can be Christianized. The Protestant churches themselves, by their ordinary methods, despair of doing the work. When Senator Blair, of the Senate Committee on Labor and Education, asked as to the Evangelical faith of workingmen, the answer is reported to have been that "a large majority are unbelievers." We can but believe that the statistical showing we have

referred to is greatly misleading. We are sure that those who are set for the defence of Christianity ought to consider, more fully and fairly than they have yet done, the serious menace to the Protestant Church which is seen in the alienation of the poor.

CONVERSATION AS IT IS.

It is one of the favorite criticisms of elderly people upon the manners and customs of the present day that conversation is dying out. The complaint is not confined to this country, but is beginning to be heard in England as well, that there are no really good talkers left; that talking is not cultivated; that every year there are more people in society who care little or nothing about conversation.

A very little observation, however, is sufficient to show that there has been no falling off in the volume of conversation. There is really, probably, more conversation nowadays than ever before. Dinner-tables may be taken as a test, and nobody who has had to go to a dinner party can fairly complain that there has been any real lack of conversation at it. Probably at any one of the big dinners that take place in New York to-night, there will be just as much language used in the course of the evening as there ever was at a dinner at Holland house in the palmiest days of Sydney Smith and Macaulay. In truth, there will probably be more, for in their day the great principle of simultaneity in conversation, as we may call it, had not been discovered, and it was still supposed that two people could not with advantage talk at once—a delusion which led to great bitterness of feeling among the accomplished talkers of the time, there being nothing more exasperating than the necessity of listening to another, with an air of polite attention, when you not merely do not want to hear what he is saying, but have something that you want to say very much yourself. How many of the caustic and cutting *mots* and repartees of the last generation must have been due to the reaction from the suffering caused by this enforced silence. There is no more pleasant feature of modern society than the unwillingness of its leaders to hurt one another's feelings by wit; indeed, wit as a conversational weapon has almost passed out of use. But nothing has promoted the good humor of society so much as the practice, which, like so many other pleasant innovations, we probably owe in the first instance to women, of several people talking at once.

It has often been noticed that women find no difficulty in simultaneous conversation. When two or more women meet, no one of them thinks it necessary to wait until the conclusion of the remarks of a speaker before rejoining or replying. On the contrary, all begin at once, and talk together, without any apparent attention being paid by any one to the remarks of any other. Nevertheless, at the end, they all appear to have an idea sufficiently accurate for their purposes of what has been said to them. This practice formerly used to be brought into ridicule by male writers of novels and plays, but of late years women have introduced it into use to a far greater extent than is commonly supposed. Among them it answers to "general conversation among men, and men, though they have not yet developed any great aptitude for it, evidently have begun to like it in women, for they always encourage it by sympathy and laughter, and in time men too will probably become experts in it. The more progress made in this direction, the more actual conversation there will be, and one of the greatest obstacles to general social expression will be removed. The only stumbling-block that can be suggested is the effect of the noise on the nerves, and this is not and never has been minded by women. The nervous organization of man is so much coarser than that of the other sex, that it is absurd to say that a taste for noise or tumult, which women actually enjoy, is beyond the reach of men.

All this goes to show that conversation, instead of being on the wane, is really on the increase, which tallies entirely with the view taken by Carlyle of the subject, and accounts too for the failure of his effort to reduce the rest of the world to silence by his own unremitting talk. The day for that was gone by, as he found, and as all those who imitate him will find. It is on the whole impossible to understand the cry that conversation is dying out, except on the supposition that those who make the complaint have in view not so much a diminution of the quantity, as the deterioration of the quality of conversation, and this view of the subject needs consideration.

Conversation, according to the view formerly taken of it, undoubtedly meant to a certain degree a discussion of subjects. What these subjects were must always have depended on the character and circumstances of those who took part in it. Their general object, however, always was to discover some subject of common interest, political, literary, social, or merely frivolous, and the avoidance of subjects which possessed no common interest. It is at this point that the new theory of conversation again diverges from the old, and introduces a most important innovation. This is, that for real enjoyment the true rule is not to waste time in trying to find common subjects, but to set to work talking about the subject that is most dear to and most carefully studied by every human being — himself or herself, as the case may be. The world, everybody knows, is divided into the Ego (as we should say, the Me) and the non-Ego (or the not-Me). This is a proposition of which every one, from a German metaphysician to a Tammany heeler, feels the truth the moment it is brought to his attention, and the difference between the modern and the old theories of conversation hinges upon it. The old idea was that conversation ought to be confined to the non-Ego. The modern theory makes its principal subject the Ego. If you notice, as anybody may sometimes be compelled to notice, the conversation of older people who have got in their day a reputation for talking well, you perceive at once that they avoid the very subject that you talk best and oftenest about—your own private feelings, ideas, hopes, prejudices, habits, fancies, and tastes; what you like best to eat and drink; what you care to do or not to do; what you wear and how much you pay for it; your family, your husband, wife, or children, and what wonderfully clever, or good, or fast, or religious people they really are when you know them—all matters carefully to be avoided on the old theory, as likely to be generally uninteresting or even offensive, not to the talker, but to the listener. We see no reason to believe that they are generally offensive to him any longer. They are universally accepted topics of conversation, and we know of no scene of modern life which shows in a stronger light the progress of human sympathy and kindly fellow-feeling than a room full of people all talking about themselves—many simultaneously. If it is true that fifty years ago such conversation would not have been regarded as endurable, then all that can be said is that the fact is a remarkable proof of the enlargement of this field of intellectual activity. And yet this is undoubtedly what elderly people call the decline of conversation.

POLITICAL INFLUENCE OF THE PRESS IN ENGLAND.

London, November, 1883.

The most considerable changes in the social or even in the political life of a country are sometimes those which are least noticed while they are in progress—perhaps because they are very gradual, perhaps because in some cases they do not affect directly any institution, but those habits of thought and action which are much more impalpable. Indications are not wanting that such a change is now passing on the political influence of English journalism. It was very powerful a few years ago, and most observers predicted for it a continuance or even an increase of its power. That power seems to be now on the wane. I do not mean that the newspaper press is less able or less upright than formerly. Setting aside the so-called "society journals," a new and painful feature in our periodical literature, the tone of the English press, its independence, its incorruptibility, compare favorably with those of any other European country. Such *chantage* as exists in France, such subjection to clique influence as exists in Italy, is unknown here. Nor does the literary merit of the writing which fills our papers seem to have declined. There are five or six dailies in London, and eight or nine in other cities, whose articles are both in substance and in form up to the best average level of any former generation, although there may be no single writer so brilliant as one or two whom our fathers admired. Still less can it be suggested that newspapers are less read than formerly. They are read not only more widely than anywhere else in Europe, but much more than ever before in Britain itself. Women read them more generally, and the number of persons who in every great town purchase an evening—usually a halfpenny—as well as a morning paper, is always increasing. The view which I am stating is that the weight and authority of the press, and especially of the daily press, is declining; that it does not count for so much, as a factor in our politics, as it did twenty years ago. It is difficult to distinguish between the influence of a newspaper as enforcing its own views, and the importance to be attached to it as indicating the views of those for whom it is written—as the expression, in other words, of a clever editor's notion of what it is that large sections of the people are thinking and desiring to hear. Most people do not draw the distinction, and quite naturally, because the authority of a paper depends more largely on the belief that it can divine public opinion than on any confidence in its own wisdom and foresight. To put it shortly, what I mean is, when a newspaper urges or dep-

recates any line of conduct, or sustains or condemns any opinion, its advocacy makes less difference to the fate of that line of conduct or opinion than would have been the case, say, twenty years ago. People note the fact of its attitude—more people note it, because more read; but they care less about it, and are less disposed to shape their own acts or views accordingly.

To convey to readers at a distance a just idea of the impressions which lead one who lives in England to think this a probably true generalization, would be far from easy. One may be pretty sure of a conclusion, more sure than I can profess to be of this one, and yet be unable to set forth, even to one's own mind, all the grounds it rests on. I will mention a few facts which bear on the matter and indicate the conclusions they point to. One is the great increase in the number and importance of political speeches delivered out of Parliament. Not so long ago, in fact down to 1876, an epoch making year in our recent party history, the harangues which were addressed to the inhabitants of the towns, even the great towns, were given by local men. The member delivered at least one every year, the active and aspiring local politicians gave others whenever an occasion arose which seemed to call for a public manifesto; and when any large measure was exciting the country, and required a sort of campaign to advocate it, lecturers were brought down who added their voices to those of the orators of the spot. It was a somewhat unusual and remarkable event when a statesman of the first or even of the second rank went to a place with which he had no personal connection to address the electors on public affairs. Nowadays such addresses are almost as much part of a statesman's work as his attendance in Parliament. The Parliamentary recess, which used to be a vacation, now merely changes the sphere of his toils from Westminster to the country. From the middle of October till Parliament meets in February, the fire of speeches is kept briskly up all over the three kingdoms, and the eminence of many of the speakers causes their words to be reported in all the newspapers. This is a serious addition to the already heavy burdens of English public life. It is, all things considered, a doubtful benefit, for it tends to keep up a sort of factitious excitement, and to disturb those intervals of repose which the mind of a nation, as well as the minds of individuals, profits by. But it has the advantage of giving a great deal of political education to the classes which care about politics. And in proportion as it does so, it encroaches on the function which the newspaper editor formerly had to himself during the recess, and makes that function relatively less important. A speech by a well-known statesman is likely to be as readable as a leading article in a newspaper, and is made more weighty by the speaker's position and responsibility. The ordinary citizen judges it for himself, and depends less and less on what his editor tells him. His judgment grows more independent; and, though he reads the paper as much as or more than he ever did before, he is apt to be less guided by it.

Another fact of moment is the greater relative importance which the press outside London has obtained of late years. Formerly it was only the London dailies that were supposed to exercise any considerable influence, or which were looked to to discover the sentiments of great parties. Now there are daily journals in some of the great cities—in Manchester, Liverpool, Leeds, Birmingham, Newcastle, Edinburgh, Glasgow, Dundee—which are as ably conducted as their London rivals, and which represent just as fairly the sentiments of large sections of the population. They divide the influence of the press, and though none of them addresses so large an audience over all England as the *Times*, or *Standard*, or *Daily News*, or *Pall Mall Gazette*, their rise has sensibly affected the authority which those organs used to wield. Anybody who should think that he had got an adequate notion of British opinion by reading the London dailies would grossly err; and it amuses us here to see the way in which people in France and Germany continue to quote the *Times* and the *Standard* as authoritative exponents of tendencies of English opinion, when they might almost as well quote the Manchester *Examiner* or the Liverpool *Post*.

This change is of course more perceptible in the rest of the United Kingdom than in London, where only London papers are read, whereas elsewhere many people read both a London paper and a local one. Yet even in London the knowledge that the local press has grown abler and stronger affects the reader's mind. He knows that his London organ does not count for so much in the North or the West as it once did. He remembers that the majority of the London papers have several times lately been hopelessly wrong in their judgment of the thoughts and intentions of the nation. During the later part of Lord Beaconsfield's reign, his foreign policy was supported by the *Times*, the *Standard*, the *Daily Telegraph*, and the *Pall Mall Gazette* (which was then practically, although not nominally, a Conservative organ). The *Daily News* was the only morning daily paper of consequence (for the *Daily Chronicle* had not then reached its present position) which disapproved of the Tory policy. All the others declared, and believed, that the country was heartily with it. Yet the country decisively condemned it at the general election of 1880. Such a catastrophe has shaken the confidence of the Londoner in the infallibility of his advisers.

Further—although this is a point which may be deemed more doubtful—the press has become in the last two decades less impersonal than formerly. Everybody who cares to know can know who are the editors of all leading papers, whether in London or elsewhere, and even to some extent who are the chief writers on the staff of those papers. The articles they contain are therefore more and more regarded as expressing the opinions of this or that man—almost invariably an able man, whose opinion is well worth having, but, after all, only the opinion of an individual, or, if you add the editor to the leading-article writer, of two individuals. England is becoming so much smaller a country than formerly that the familiarity with the *personnel* of newspapers, as of other institutions, which used to be confined to a few people, and those in the capital, is now pretty widely diffused. Besides, we have so many political articles in so many magazines and reviews bearing the names of eminent persons, that the multitude of counsellors emancipates the public from its dependence on any. When a thinker or politician writes in a magazine under his name, as most now do, he does not claim to speak *ex cathedra*, but addresses arguments or appeals to the people, and makes them the judges of what he says. They acquire the habit of judging, and this habit reacts on their attitude toward the anonymous oracle of the breakfast-table. He too is judged, he is disagreed with more readily, and when he is agreed with it is with far less deference than would once have been accorded.

This seems to be the tendency which now rules in England, and which (as has been said) coexists with a rise in the moral strength and intellectual vivacity of the press throughout the country. As it has no bad effect on the press, nor prevents it from continuing to attract first-rate ability, it is probably a good tendency, rendering ordinary people somewhat more independent and less at the mercy of concealed advisers. It might become an evil if it went so far as to render men indifferent to the political part of their newspapers, but of this there is no sign. Leading articles are perhaps not so long as they used to be—several papers have taken to writing short smart ones; but as large a part of the paper is occupied by political subjects, and as much of its literary capacity is devoted to that department. The falling off is rather in the Parliamentary reports, which have now become very meagre except in the *Times*, and which even there deal liberally only with some eight or ten of the leading men. Parliament has doubtless overtaxed the patience of the country, and the newspapers are giving it a deserved punishment.

Y.

THE CORRESPONDENCE OF CHARLES DE RÉMUSAT—I.

PARIS, Nov. 8, 1883.

THE Memoirs of Mme. de Rémusat have met with much success. They have thrown considerable light on the life of Bonaparte during the years of his Consulate and at the period of the establishment of the Empire. The son of Mme. de Rémusat, M. Charles de Rémusat had inherited all the amiable qualities of his mother. He took much part in the political life of France, under the reign of Louis Philippe, and became one of the lieutenants of M. Thiers. His philosophical and literary works, which are numerous, gave him a place in the French Academy, though they are probably not destined to live long. There are some men who are better than their books, others of whom it can be said that their books are better than themselves. M. de Rémusat belonged to the first class. His conversation was charming, he was winning, persuasive, clever; his books are somewhat misty and dull; his philosophy (for he was a philosopher) has no precise features. His works on Saint Anselm of Canterbury, on Abelard, on Bacon, are not exhaustive; his dramas (for he wrote two dramas), called "Abelard" and "Saint-Ber-thélemy," have not much life or movement.

Men like M. Charles de Rémusat, who are not found in their books, sometimes are found in their correspondence, as letters have often all the liberty, the familiarity, the ease of conversation. M. de Rémusat was the most brilliant of talkers; we have, therefore, perused with the greatest eagerness the first volume of his correspondence, which has just been published by his son, M. Paul de Rémusat. This first volume contains only letters which were written during the first years of the Restoration. This period, which followed the First Empire, has hitherto only been described by historians; its familiar life is hardly known, though it is so near us. We only have the amusing memoirs of M. Beugnot, as the memoirs of Talleyrand are still unpublished; Chateaubriand gives us some interesting details in his "Mémoires d'Outre-Tombe." The collection of memoirs on the nineteenth century is not yet very rich; and it may be that few "memoirs" are written in times when the newspapers give us daily details on all men and things.

The correspondence opens with a letter of Mme. de Rémusat's (the author of the Memoirs) to her son Charles, who is still at school in a *lycée*. The allied troops had just entered Paris;

young Rémusat had read Chateaubriand's pamphlet 'Bonaparte et les Bourbons,' and had judged it very severely, and his mother reprimands him for speaking lightly of a man "who belongs to a respectable family, and who bears a name revered in France." Mme. de Rémusat approves of Chateaubriand's book, and will not even call it a pamphlet. "Your father and I have seen much of the Emperor. God is my witness that I have always forgiven him the harm he did me, but I have cruelly felt the harm which he did France. I have often seen your poor father, when we were alone in the evening, moved to tears, and inclined to leave him, but kept in his post by the idea that, in bearing everything, he worked for our future. Three months ago your father and I called for the reaction which has just taken place. It destroys our own situation; still it was the object of our desire." This was the moment when the marshals and generals had forced the Emperor to abdicate. The Emperor had struggled in vain. He had in vain made reservations for his son. The Senate had voted the reëstablishment of the ancient monarchy. "Paris," writes Mme. de Rémusat to her son, "is full of French soldiers, who ask for bread; the Russian soldiers give them some of their own. Yesterday the conscription was abolished."

Young Rémusat was very precocious and clever. He wrote verses after the fashion of the poets of the eighteenth century. He left college in 1815, and was living with his father and mother in Paris when Bonaparte came back from Elba. On his journey the Emperor signed several decrees, and among them one exiling several persons. In the number was M. de Rémusat, who left immediately for Toulouse, where his wife and his son Charles joined him some time afterwards. While he was alone in Toulouse, Mme. de Rémusat wrote him some curious letters. "The Emperor works much; he shows himself, walks in the streets, holds reviews, holds many councils, shows great calmness. . . . It is said, he is much struck by the progress which the liberal spirit has made in France." The *Moniteur* published at that time some letters addressed by Talleyrand to Louis XVIII., when the King was still in England, and speaking of M. de Rémusat as of a man who could give him very valuable information on men and things, and advising him to keep him in his household. This note was known at the time by Napoleon, and was the cause of the decree which exiled M. de Rémusat from Paris.

Young Charles also wrote to his father. He was then, what we have always known him since, inclined to argue without any *parti-pris*, fond of paradoxes, caring little for his own opinions (if he had any opinions of his own), very sceptical, and having at the same time a *fonds* of invincible liberalism of a vague sort; ever ready to speak well of his enemies, and, what is more, to think well of them, ready also to criticise his friends—fugacious, gentle, yet obstinate, on the whole a very singular and extraordinary character. In 1815, before the invasion, he writes: "It seems to me that the chances for peace are more numerous than a few days ago." He writes also: "You know I have no ambition, and, if I can only pay 1,000 francs taxes, I am satisfied." To pay a thousand francs taxes was then to be eligible to the Chamber of Deputies.

Mme. de Rémusat was with her son in the South, at Lafitte, in the middle of June. She accepted cheerfully her exile from Paris; she enjoyed the rusticity of the old château, her pigs, her hens, the distant view of the Pyrenees, the great plain dotted with villages. She devoted most of her time to her son Charles, who wrote, read Homer and Virgil, made songs, and bore his new life with much philosophy. She says to Mme. de Nansouty: "Always the same calm, the same pure sky; the fields become more yellow, and they occupy everybody in the country. . . . There is not a peasant who does not cast a melancholy look on his fields when they speak to him of marching on the enemy." Mme. de Rémusat sometimes makes deep reflections almost unconsciously: "My dear, the more I observe the inhabitants of the country, who are the great mass of the population, the more I see how few means of understanding there are between them and those who govern. . . . Out of three millions of men, two and a half, at least, do not understand anything in those speeches composed with so much care, those writings dictated or prepared in the room of any sovereign you choose. . . . A peasant asked me yesterday if it was true that the Emperor would marry the Duchess of Angoulême, and adopt the King, in order that the Spaniards should not cross the Adour."

The battle of Waterloo ended the exile of the Rémusats. Talleyrand was again minister, and by his influence M. de Rémusat had been named prefect of the Haute-Garonne. He went to Toulouse, and found there another prefect, appointed by the Duke of Angoulême. The disorder of the times explains such confusion. The letters of his wife show how ardent was the reaction against the Empire and its supporters. In the Royalist camp there were two parties—the pure Royalists, the partisans of the Duke of Angoulême, and the supporters of the Constitution. Charles de Rémusat went to Paris at the end of 1815, and began his law studies. His correspondence with his mother became regular from that moment. The young student writes to her about Marshal Ney: "M. Berryer has spoken as badly as possible; he is a lawyer *dans toute la force du terme*." This judgment of Berryer seems singularly harsh. The divisions in the South were furious. On his way through Nîmes, the Duke of Angoulême ordered that the Protestant churches should be opened. The Catholics of the town resisted the order, and in the tumult General Lagarde was struck by a ball. "We are in France," says Mme. de Rémusat, "the dupes of words. We have made Jacobins of our *Fédérés*, *Fédérés* of our Protestants, Huguenots of our Protestants. It seems as if we were again in the time of the League. I do not despair of hearing people speak, one of these days, of Albigenses. It seems very natural that the Catholics should have shut the Protestant churches in Nîmes, or burnt the houses of the Protestant merchants who lived there, and turned them out of town. People do not even blame much the murder of General Lagarde [who fortunately did not die from his wound], and are surprised that Monseigneur should come to the rescue of the *infidels* and of a French general." Passions, even now, run very high in Nîmes, and there is always a religious undercurrent in the politics of some cities of the South.

Speaking of the trial of Ney, Charles writes to his mother: "It is believed that the accused will be executed when you receive this letter. It appears that he will be beheaded. [Marshal Ney was shot in the Garden of the Luxembourg.] But it would not do for little ladies, at their firesides, to lift their blue eyes to the sky, and say: 'What a sweet satisfaction!'" From Toulouse, Mme. de Rémusat continued to direct every step of her son. She knew every book he read. There was between them the most amiable intimacy. He told her all the political news, reported what he heard at M. Pasquier's, M. Molé's, at Mme. de Rumford's. (She had been Mme. Lavoisier, and had married Rumford after the death of her first husband.) Speaking of Humboldt, whom he saw at Mme. de Rumford's, he says: "He is a great talker, and an amusing one. It vexed me when I heard him, with a sort of generosity, pitying France, praising her, defending her, and attacking the policy of his own government on every point, with a tone of contempt." Of Mme. Récamier, he says: "I found her handsome, but not more so than others. She said nothing, or only a few words, so I took her for a young person, recently married, during the first part of the visit, and I was dumbfounded when I heard her name. She seems always to want people to think that she is herself. Understand, if you can."

The letters of the mother at this time are decidedly better than those of the son: they have much grace, much fluidity of thought and of expression. Her *esprit* is of the best sort: "Between sovereigns one speaks only *à coups de canon*, and we have no guns left. The coming generation will repair this." Speaking of the last century, she says: "It was still possible then to say: 'le bontemps que le siècle de fer' [a verse of Voltaire's]; now we can say nothing at all." Speaking of constitutional government, she says: "We have only the façade of English institutions; when we look behind, we don't understand anything."

Correspondence.

TRADE-UNION MORALITY.

To the Editor of The Nation:

Sir: In connection with what appeared in your columns on Thursday in regard to "Trade-Union Morality," I should like to call your attention and that of your readers to the following, which appears from time to time in the *Star* of this city:

"HOUSE PAINTERS.—At the last meeting of the Union it was decided to boycott the *Post* until it becomes a Union paper, and request all persons that support said paper to stop the same or you will refuse to deal with them. By order of the Painters' Union."

Persons of wealth who are intending to reside in Washington will either be compelled to bring well-principled tradesmen here, or be prepared for insult, for work undertaken and relinquished at will, or for wilful injury to property whenever it is discovered that a patron is not on the side of the "Union."

Very truly yours,

Caroline H. Dall.

Washington, D. C., November 23, 1883.

To the Editor of The Nation:

Sir: Permit me to express my admiration and gratitude for the excellent article which occupies the leading position in this week's *Nation*. If one were to write you whenever those feelings were excited in a very high degree by the *Nation's* utterances, he would impose an insufferable burden upon your time; but one may perhaps be excused for giving expression to them in this instance, where a personal element enters into the matter, and where nevertheless that combination of lucidity and force and lofty morality, with moderation and humanity, which the *Nation* has made familiar to its readers, is so conspicuously present. It is sad to reflect how much the condition of mankind could be improved, both materially and morally, if men in general could feel a tithe of the spirit which animates your article; but one may trust that even a single article like yours, coming home to men's hearts as only that which arises from concrete

facts can, is capable of permanently impressing some, at least, of its readers with truer views of the rights and duties of both laborers and capitalists.—Sincerely yours,

FABIAN FRANKLIN.

BALTIMORE, Nov. 23, 1883.

COLLEGE SOCIETIES AGAIN.

TO THE EDITOR OF THE NATION:

SIR: The article in the *Nation* of Nov. 15th concerning "The Senior Society Evil at Yale" so interested me, in common with the great majority of students here, that I ask space to bring out some few facts but briefly hinted at in the former article. At once I hasten to correct an opinion, which seems to have crept into the minds of many, that the real appreciation of this evil is confined to those outside the societies, and perhaps is strongest among those who but just failed of an election. Such, however, is not the case. The societies create an aristocracy, false though it be, and apparently are so powerful that it is only in very rare instances that men are unselfish and brave enough to sacrifice what seems likely to be of great personal advantage for the sake of what they themselves believe to be the best interest of Yale. I know of men, now forever silent on the question since they are of the elect, who were saying in the words of one member, spoken just before election: "I tell you, senior societies are the moral rottenness of Yale College, and I shall *think* the same after I get in." There have been refusals of an election—yes, and there have been men, even after election, and when the system in all its moral wrong and political chicanery became known to them, who were brave enough to resign such questionable honor.

We can only judge of these societies by their results, and by the influence which they exert over the College. From the entrance in freshman year, so soon as the power of these societies has begun to be realized by the incoming class, and the means of obtaining an election have begun to be appreciated, the whole energy of a goodly number is bent upon securing this one end. And, alas, in the great majority of instances the means employed are those of "jolly good-fellowship," which, in the language of fact, is simply dissipation and indolence. I know of men whose whole moral nature has been radically changed simply from their endeavors to remain intimate with the "gang" who manage the elections, and to remain in whose good graces demands a sympathy in their tastes and practices which are too often of a dubious nature. The most actively religious man in college to-day said to me: "There can be no doubt that so far as college position goes, the man who drinks has a great advantage over the temperate man."

That men will so forget their self-respect and gentlemanly instincts as to lose independence of word and action, and almost of thought, in order carefully to refrain from creating any adverse opinion among the society men of the senior class, is a lamentable but well-known fact. As I looked out on the campus, but a day or two ago, I had pointed out to me a prominent member of the senior class. "That man," said an old friend and chum of his, "is a totally different man to-day from what he would have been had senior societies not existed here. From his freshman year he has worked in every conceivable manner to improve his 'chances,' and it has changed him completely." This is but one example taken from a score.

Did I dare trespass upon your space further, I should like to leave for a moment the moral side of the question, and with the former writer speak of the *absolute* control of the College press; and of the support of the Faculty, who, among the younger members, in many instances ridiculously show their society pins upon their vests to the admiring undergraduates. I would speak, too, of the lack of interest in literature and athletics, except as they can be used for a means to secure the desired end; but I forbear to speak of these. At least there is no graduate of this college who does not fully understand and appreciate the facts herein stated, and they are but the incomplete examples of a long list of facts disgraceful and detrimental to "old Yale."

The time has come when such evils, long kept from the light, demand examination, and, in the name of the undergraduates here at Yale, I also call upon Alumni, Corporation, and Faculty for a careful investigation, and such action as shall then become necessary. SENIOR.

YALE COLLEGE, Nov. 19, 1883.

TO THE EDITOR OF THE NATION:

SIR: It is with deep regret that the students of Yale read the communication in your last number with the above heading. Such an article does very great harm to the College, and accomplishes no compensating good, while it fails altogether to express the sentiments of the students or, presumably, of the Faculty.

There is now no ill-feeling against the societies except among the very small number in the senior class who constitute the sorehead element. Does the author wish to bring back the state of feeling that prevailed four or five years ago, when hostilities were so bitter that the locks and fences of the society halls were broken? In these feuds, whichever side gains the victory, the College suffers the harm.

By looking only at the faults of the societies, by exaggerating and misstating facts, your correspondent has drawn a gloomy picture, well calculated to deceive any one who is not intimately acquainted with the true state of affairs here. I shall not attempt to refute his arguments in detail, but one or two seem important enough to deserve a word of explanation.

It ought to be the glory of Yale journalism that such an article as your correspondent's cannot appear in any of the College publications. There are thirteen secret societies here, and more than one hundred other organizations of an athletic, literary, or social character, and not one of them is ever attacked by any Yale publication. It was not many years ago that the College papers were open to such articles, and much ill-feeling and harm to the College was the result. We earnestly hope that the papers will continue in their present course in this respect. So much for the freedom of the press.

Your correspondent says that the quality of study deteriorates after the senior society elections. Of course it does. The elections occur in the latter part of May, when the weather is warm, athletic sports are flourishing, and "spring fever" affects us all more or less. The Faculty tacitly acknowledge the increased difficulty of study by decreasing more or less the amount of study required in *all the classes*. It is nonsense to charge this to the senior societies.

In other cases your correspondent has obviously allowed the personal prejudice or the sorehead feeling of graduates to form the basis of his argument against the societies. You can make an argument against anything in that way.

He has by no means thrown the burden of proof on the other side. Societies to which "half" the Faculty belong; to which the most distinguished graduates, ministers, lawyers, men of business, return with the utmost pleasure year after year; of which the best men in every class are glad to become members; to which religious men can consistently belong—such societies are not to be condemned with no more authority than the word of a man whose manner of relating facts strongly provokes us to suspect his motives.

The writer is not a member of any secret society, and does not expect to be.

M. M.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent, "Yale," is entitled to the thanks of all interested in the welfare of colleges and college students for his statements concerning the evils caused by the secret societies of Yale College. But what he says applies with local variations to Harvard College, where the secret societies have also become a nuisance. Offensive class distinctions are fostered by them, and their initiations combine the barbarous and the ridiculous, and, to a considerable extent, take the place of "hazing" for many to whom that old-fashioned amusement, so long tolerated and half approved by former generations, would be a delight. Many young men spend a large part of their time in trying to ingratiate themselves with those who control the elections, interfering seriously with their studies and not improving their characters. Those who confine themselves to one clique in a class lose in large degree the opportunity of the study of the wide range of character that a college class affords, and their experiences and sympathies are of a narrower range.

Of course, one must in some way learn to resist temptation, but boys fresh from great boarding-schools, where they are subject to the tyranny of certain members of their class, or to its strange public opinion, are too much in the moral condition of sheep that follow their leader in jumping over a wall, to be exposed needlessly to the trials that beset adult life.

It seems hopeless to appeal to the good sense of the undergraduates themselves; the graduates are often inclined to look with favor on an abuse in which in earlier days they shared, while the governments of the colleges, which have at times prohibited secret societies, hesitate to apply such a remedy, which, like prohibition of drinking, is very imperfectly effective. It may be desirable that parents should forbid their sons joining these secret societies, which often do much harm. I know that it is not the fashion for parents to forbid, but they can control in this matter by ceasing to pay bills, and colleges are largely dependent upon graduates and parents of graduates for funds. I fear that nothing but an appeal to a public opinion wider even than that of the graduates will produce any effect.

A HARVARD GRADUATE.

GOODNESS AND THE THEATRE.

TO THE EDITOR OF THE NATION:

SIR: In a recent number of the *Nation* (which I remailed to Europe, and hence cannot quote verbatim from), you referred to certain remarks of Dr. T. L. Cuyler on the theatre, in terms well adapted to make the impression that Dr. Cuyler's habits of thought and notions of "good" make it natural that he, and those of his "class," should be hard to please when the subject of the theatre is in hand. But I must confess that the dress in which your editorial set him up made him look wonderfully like Edwin Booth, in language over his own name in the *Christian Union* a few years ago: "My knowledge of the modern drama is so very

meagre that I never permit my wife or daughter to witness a play without previously ascertaining its character."

Dr. Cuyler, in your dress, reminded me also of the late W. C. Macready, in his own words, "None of my children shall ever, with my consent, or on any pretence, enter a theatre or have any visiting connection with actors or actresses." Mr. Booth's language, while characterized by the moderation of thoughtfulness, clearly indicates a justifiable suspicion of *all* theatrical plays. And that especially appears when he adds, "If the management of theatres could be denied to speculators, and placed in the hands of the actors who value their reputation and respect their calling, the stage would at least afford healthy recreation, if not indeed a wholesome stimulus to the exercise of noble sentiments" (very large *ifs*). "But while," Mr. Booth adds, "the theatre is permitted to be a mere shop for gain, open to every huckster of immoral gimcracks, there is no other way to discriminate the pure from the base than through the experience of others." This would seem to justify Dr. Cuyler's caution to the young to hold cautiously back, and his intimation that "good" mothers are happy when sure that their children are not in the theatre.

Whatever else may be laid to the charge of Dr. Howard Crosby, few, I think, esteem him narrow. But he has said, "As they (theatres) *are*, I pronounce them satanic and soul-destroying." And an actress meets Mr. Booth's customary caution for his wife and daughter with the suggestion, that she knows, from having been behind the curtain, that the play which is rendered purely one night, with the knowledge that certain persons are present, will be rendered impurely the next night.—Respectfully yours,

JAMES H. TAYLOR.

ROME, N. Y., November 14, 1883.

CONGRESS AND THE NAVY.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* for November 1 you print a letter from a correspondent, under the heading, "What Congress should do next for the Navy." Although the argument, therein set forth, to show why Congress should take means to increase the effective power of our navy is in no respect new, yet it contains some points which should not be allowed to pass without comment. The writer says that—

"The well-known defenceless state of our coasts would cause offensive action, which, under other circumstances, would not be thought of, and, in the event of war, would lead to an attack upon our rich maritime cities. These would present themselves as tempting prizes to even moderately powerful naval nations, and before we could realize that war was upon us, we might find an enemy's fleet levying tribute from our largest ports."

Now, although the occurrence of this state of things may be barely possible, it seems to me to be extremely improbable. It would certainly be a very short-sighted policy for any nation to pursue. For even supposing it could take possession of one or more of our principal seaports, it is plainly evident that it could take possession of nothing more, and would eventually be obliged to abandon even these. The idea of a European state transporting an army sufficient to retain even a small portion of this country, for any length of time, is wholly out of the question. Hence I say it would be a poor policy to attack us at home, a thing which without good reason no nation would be likely to do.

Thus, after calculating the chances, we find the likelihood of such an event occurring too small to justify us in building up and supporting an elaborate and costly navy. But now suppose the event did really occur while our naval forces are in their present condition. What would be the result? Undoubtedly, there would be considerable property destroyed. As your correspondent indicates, an enemy might levy tribute from our rich maritime cities. But, as already stated, this could be but temporary, and let it be remembered that the very existence of such rich cities as New York, Boston, Philadelphia, etc., is largely due to the fact that the people have not in the past been obliged to expend their energy in keeping up an extensive military system, but have been left free to direct their labor toward the production of that which is of some use. An enemy could scarcely leave us in a worse condition than we should now be in, had our fathers deemed it necessary to maintain a military force similar to that of Germany or France. Our maritime cities would not be what they are now had this been done. The building up of an expensive navy now would be paying a very high premium for our insurance. It would be robbing the people in order to obtain means to protect, and, as we have seen, to protect them from an imaginary danger. Of course, if it could be proved that a greater fighting force is actually necessary to protect us from foreign invasion, the case would be different. No one would like to see the country tamely submit to any depredations a European army might commit. But a people that were not disposed to submit to being robbed by foreigners, would not be inclined to submit to being robbed by their own countrymen. In other words, those who would refuse to give up their property at the demand of a band of invaders, would be apt to refuse a like demand from a medalesome Congress.

Then, again, there is another reason why our army and navy should not be increased. As a carnivore develops teeth and claws, he at the same time develops a desire to use them; so, with a race of men, the more confidence the people have in the effectuality of their military and naval systems, the less provocation is required to induce them to go to war. They will find reasons for conflict which, if these systems had been weak, would not have been thought of. Thus, by increasing our fighting qualities, instead of furthering the possibility of peace in the future, as your correspondent thinks it would, it would directly augment the probability of war. Your correspondent trusts that Congress will not be allowed to remain satisfied with the building of a few commerce-destroyers. I suppose that it would be too much to expect, at the present stage of civilization, that a body of representatives could be induced to turn their whole attention to the production of commerce, rather than its destruction: but every step taken in this direction must be considered as an advance, and every step in the opposite direction as a retrogression.—Yours truly,

J. EDWARD CHAPPEL.

WARSAW, N. Y., November 20, 1883.

GENERAL BUTLER AT BALTIMORE.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "G. B." has fallen into a trifling error in his reference to General Butler's achievements in Maryland. The General did not command the Fifth, but the Eighth Massachusetts Regiment; and he did not lead them through Baltimore at all, but carried his troops from Philadelphia by rail to Perryville at the head of the Bay, and thence by steamboat to Annapolis. Here he wrote a letter to Gov. Hicks, in a decidedly apologetic tone, asking permission to land his men and "to pass quickly through the State on my way to Washington, respecting private property and paying for what I receive."

Gov. Hicks protested; but Gen. Butler, being reinforced the next day by the Seventh New York Regiment, felt strong enough to disregard his protest, and carried his men by rail from Annapolis to Washington.

On May 5, the General, having been further reinforced, and provided with artillery, moved as near Baltimore as the Relay House (about seven miles off), and there fortified himself. It was here that the memorable case of stomach-ache occurred, and his "strychnine order" in consequence, which gave the material for the local farce, "Gudgeons at the Relay."

The General, as became a prudent commander, did not venture his person in Baltimore until he thought himself safe. On the night of the 13th of May, he passed quietly through the southern portion of the city, and intrenched himself on Federal Hill. On the next day he was recalled to Washington and rebuked by Gen. Scott for his deed of "derring-do"; and, on the 16th, was put in command of the Department of Fortress Monroe.—I am, sir, etc.,

A BALTIMOREAN.

THE CLASSICS.

TO THE EDITOR OF THE NATION:

SIR: One very important advantage that accrues from the study of the ancient classics seems to me to have been overlooked by its advocates. I allude to the great amount of time which, in the study of a dead language, is necessarily devoted to one book. When studying Grecian or Roman history, for example, in an English translation, most students would commit their lessons to memory—an easy task for the generality of minds. In this case the facts are not indelibly impressed on his mind, as they would be if he were to read the same facts in the original Greek or Latin. In the latter case the student does not memorize his author at all. He reads his lesson frequently without much voluntary exercise of the memory. He learns the author's peculiarities of diction; he learns, indeed, a great deal more from the same pages than if he had committed the whole to memory in an English translation.

Suppose the class were reading Virgil's 'Æneid': an English translation would convey to their minds at once the facts of the poem more clearly than they would gain them from the Latin, until after many days' study. It is a very natural conclusion that there is just so much time wasted as the excess required for reading the same poem in Latin. But the facts are of very little importance, except as a source of the interest they awaken in the student's mind. The advantages derived from the perusal of this poem and this author are like those which a young person derives from frequent intercourse with a man of superior knowledge, culture, and ability. The student becomes familiar with the author's merits as a poet, and his graces of diction, which are not the less useful in the Latin than if they were in English.

But would not the same close and long-continued attention to the pages of a good modern author be attended with equal advantages? Admitting that it might be so, we know that no such close and long-continued attention could ever be devoted by a class to an author in any of the modern languages, because they are so easily acquired. We must remember also that the modern languages are less artificial than the Greek and Latin, and do not admit of the same perfections of style; and it may be added that modern authors do not strive to attain to that degree of perfection that distinguishes the best

Latin and Greek authors. The rhetorical beauties of these authors are indeed almost unintelligible to a modern intellect which has been trained in our loose and illogical vernacular. The modern languages are better adapted to a certain style of popular eloquence than the artificial and highly intellectual languages of the classics. Indeed, by a large class of authors and critics the rhetorical simplicity of the ancients is despised. "All ages," says M. Renan, "have had their inferior literature; but the great danger of our time is that this inferior literature tends more and more to get the upper place." There is nothing like the study of the ancient classics to counteract this tendency. The classics are indeed, as it were, an anchor that prevents modern literature from flying off utterly into that "limbo" where rules are neither used nor understood.

The present century has produced works, especially in science, superior to any ancient works, and more profitable for knowledge; but they cannot be studied with the same benefit as a means of mental discipline. It a student spends a whole year in reading Virgil's 'Æneid,' or an oration of Lysias or Isocrates, it seems as if he were wasting his time. Those who think so have not sufficiently considered the practical wisdom suggested by the proverb, "Beware of the man of one book." A comprehensive reading of modern authors gives one a copiousness of diction which cannot be acquired by any other means. It affords one also a greater variety of intellectual tools. But that course of training which gives copiousness of diction, though very desirable on many accounts, is not favorable to the logical faculties or to the clearness of the understanding. The most logical minds express their ideas with the greatest simplicity of diction.

There is a liberal and a pedagogical way of studying the classics, and less good mental discipline results from the study of mere grammatical forms and construction than from a close attention to the style and matter of the best authors. It seems to me, therefore, an error to suppose that accurate grammatical scholars alone derive benefit from the study of the classics. Indeed, the highest scholars, as estimated by a mere pedagogue, may not be improved by these studies so much as those intelligent pupils who give their attention chiefly to the author's graces of style and justness of thought, and who thereby become imbued with some of that fine discrimination which distinguished that most intellectual of all nations, the ancient Grecians.

The whole gist of the subject is given in a single sentence from Matthew Arnold. Speaking of the classics, he says :

"They can help cure us of what seems to me the great vice of our literature, manifesting itself in incredible vagaries in literature, in art, in religion, in morals, namely: that it is fantastic and wants sanity. Sanity—that is the great virtue of ancient literature; the want of that is the great defect of the modern, in spite of all its variety and power. It is impossible to read carefully the great ancients without losing some portion of our caprice and eccentricity."

WILSON FLAGG.

CAMBRIDGE, MASS., Nov. 14.

Notes.

THE next issue of the "Library of Aboriginal American Literature," published by Dr. D. G. Brinton, Philadelphia, will be 'The Comedy of Guegüence,' a play written and acted by the natives of Nicaragua. It dates from the 17th century, and is written in a curious dialect, half Aztec and half Spanish. It will be ready early in December.

Mr. G. E. Woodberry, being engaged on a Life of Edgar A. Poe for the "American Men of Letters" series, requests the loan of copies of any autograph letters by Poe (however unimportant they may seem), many of which are believed to exist in private collections. None will be published without the explicit consent of the owner. Mr. Woodberry's address is Beverly, Mass.

John E. Potter & Co., Philadelphia, publish immediately 'The Elements of Botany,' by Prof. W. A. Kellerman, of the Kansas State Agricultural College.

To the fourth edition of his 'Mikado's Empire' (Harper & Bros.) Professor Griffis has added a supplementary chapter, "Japan in 1883."

We notice elsewhere at length the 'Diplomatic History of the War for the Union.' The publishers, Houghton, Mifflin & Co., have brought it out both separately and as a fifth volume in the series of Seward's Works, edited by Mr. George E. Baker, which was begun as far back as 1853, or, in other words, in Mr. Seward's lifetime and prime. The fourth volume appeared in 1861. The record is now complete, and there is hardly any other similar monument of American statesmanship which has a more enduring value for the historical student. The reading of Mr. Seward's speeches in the period before the war is and will long be a high course in political education.

Roberts Bros. have added to their "Classic Series" Bunyan's 'Pilgrim's Progress,' with good excuse, as they reproduce in facsimile the title-pages and curious illustrations of the first edition, which recall the block-books of the ante-Gutenberg period; and 'Robinson Crusoe,' with Stothard's designs, and a bibliographical introduction by Austin Dobson.

The "Merchant of Venice," from Charles and Mary Lamb's 'Tales from Shakespeare,' and the play itself, edited by the Rev. H. N. Hudson, makes the latest volume in the "Classics for Children," published by Ginn & Heath.

The "Temple Edition" of 'The Essays of Elia,' which G. P. Putnam's Sons issue for the holidays, compares well with its predecessors, of which the number is already so great. The volume is solidly manufactured, and, with its broad margins, is nearly square in shape. It is not, therefore, meant for the hand, or for familiar desultory reading. The type is large and the impression clear. But what gives the book its chief individuality is its illustrations—a steel engraving of the portrait of Lamb after Hazlitt's painting, and eight etchings by American artists. These are partly imaginative, like Mr. Smillie's "Sun-Dial" and "Detached Thoughts on Books," partly topographical; and here we think Mr. C. A. Platt takes the palm with his picturesque "Oxford," "Inner Temple Lane," and "Tombs in Westminster Abbey." Mr. F. S. Church supplies the one touch of humor by figuring the wrath of the Chinese father at his son's enjoyment of roast pig, and is at his best. There are also two etchings by Mr. R. Swain Gifford, and the whole series is above the average of those usual in American books. This edition should be sure of a welcome.

We lately noticed the prospectus of a little "Bibliotheca Curiosa," to be edited by Mr. Edmund Goldsmid, and published at Edinburgh, or rather, "privately printed" for subscribers. The moderate prices announced indicated a relatively unpretentious *édition de luxe*, and this is confirmed by the first of the series now before us. It is a reprint of Charles II.'s account of his escape to France after the battle of Worcester, as dictated by himself to Mr. Pepys, and preserved among the latter's MSS. in Magdalen College, Cambridge. This interesting narrative first saw the light in 1760. It fills less than forty pages in its present handy and comely form, the print being small but very clear, and the typography irreproachable. The title page is rubricated, and there is a parchment wrap for the paper covers. Mr. Goldsmid's notes are brief and not excessive in number, and imply that the "Bibliotheca" is intended to be read, and not merely hoarded among a book-lover's treasures.

It was last year, we think, that the practice began of converting a certain class of holiday books—single poems illustrated to the utmost—into a cross between the valentine and the Christmas card. The covers, in other words, are of colored and illuminated cardboard, with silk fringes. Such is the set which comes to us from Lee & Shepard, Boston, and which embraces "The Lord is my Shepherd," "Curfew Must Not Ring To-night," "It was the Calm and Silent Night," "My Faith Looks up to Thee," "That Glorious Song of Old," and "Come into the Garden, Maud." Concerning the merits—not very extravagant—of all of these we have had our say in former years.

The fourteenth of the ever-extending line of indexes prepared by Mr. W. M. Griswold, of the Library of Congress, is a general alphabetic *Table* of subjects, names, and authors in volumes 193-268 of the *Revue des Deux Mondes*, and volumes 1-21 of the *Nouvelle Revue* (Bangor: Q. P. Index; London: Trübner & Co.). The term covered by the former periodical is from 1870 to 1883 inclusive. As is well known, the so-called 'Table Alphabétique,' published by the *Revue* itself in 1875, is a wilderness for purposes of reference, for under authors and topics, which *are* arranged alphabetically, the entries are chronological. Such a method is of course antiquated, and Mr. Griswold furnishes quite a different key partly to the same matters (1870-74), partly to what have come after—roughly speaking, to the contents of the *Revue* during the Republican epoch. Mr. Griswold, as an international missionary of the reformed spelling, retains the autographical peculiarities of his other indexes, as (to cite the more perplexing) "fonografe," "fysiologie," etc.

Students of English history are to be congratulated on the revised and cheaper edition of Mr. S. R. Gardiner's great work (Longmans). It is announced as to be in ten volumes, extending from 1603 to 1642, covering the ground of the ten original volumes. Four volumes have already appeared, coming down to 1623. This is the period covered by the two works—"History of England to the Disgrace of Coke," and "The Spanish Marriage." Any one acquainted with Mr. Gardiner's methods as an historian would feel sure that the revision is made with the most conscientious care; a preface to each volume states the new materials made use of in the revision. The principal part of the introduction to the original first volume, giving "a somewhat lengthy sketch of English history down to the death of Elizabeth, . . . is now omitted, partly because it seems out of place, and partly because I have recently given it to the world in a more mature form, in an 'Introduction to the Study of English History,' written by me in conjunction with Mr. J. Bass Mullinger." Among the new sources of information mentioned in the preface are Spedding's edition of Bacon's 'Letters and Life,' which is "simply invaluable to the historian of Bacon's period"; new volumes of the Calendars of State Papers; numerous manuscript collections; transcripts from the Venetian archives,

etc. The foot-notes, containing references to authorities, are not numerous but judicious. The importance of these four volumes is all the greater because the reign of James I. has been rather neglected by historians, coming between the familiar events of Elizabeth's reign and those of Charles I., which have been so abundantly described. But the reign of Charles I. cannot be fully understood without that of his father, for it was now that the seeds were sown which afterwards bore so bitter fruit.

A new novel by Mr. F. Marion Crawford, the author of 'Mr. Isaacs' and 'Dr. Claudius,' is about to be published in London by Chapman & Hall. It is called 'To Leeward,' and is of a different kind from any of this writer's previous works, being described as "the analysis of a social drama," and ending—as the title implies—in a catastrophe. The scene is laid entirely in Italy, principally at Sorrento, and the action is concerned with the career "to leeward" of the heroine, who is the daughter of an English mother and a Russian father, married to a worthy Italian count, and whose life is wrecked for want of a certain anchor which is left out of sight in the scheme of contemporary social life—at least upon the Continent. What the anchor is may be gathered from the phrase *ex nihilo nihil*, which was originally intended for the title. The story is said to contain Mr. Crawford's most entertaining and vigorous writing. The American publishers will probably be Houghton, Mifflin & Co.

The "Birds" of Aristophanes is being produced by a company of undergraduates in the St. Andrew's Hall, Cambridge, England, for five nights, beginning on the 26th instant. As before, the enterprise is under the management of Dr. Charles Waldstein, of King's College, who has specially devised some stage dances for the occasion and has directed the designing of the costumes. Mr. John O'Connor, whose scene for the "Ajax" was so effective last year, is again painting the scenery, and the music has been composed by Mr. Hubert Parry. The "Agamemnon" at Oxford, the "Œdipus" at Harvard, and the "Ajax" at Cambridge have abundantly proved the power and interest of Greek tragedy; it remains to be seen whether the humor of Aristophanes will be equally appreciated by a modern audience.

Mr. Fred W. Foster is now contributing to *Notes and Queries* an interesting "Bibliography of Beauty Theories," chronologically arranged.

The inauguration of Gustave Doré's statue of Alexandre Dumas has called forth a flood of reminiscence. The most elaborate attempt is a study of Dumas's work by M. Blaze de Bury, now publishing in the *Figaro*. Richer in personal detail is an account of Dumas's last days, published in the *Revue Critique* and written by M. Benjamin Pifteau, who was one of his secretaries. From a letter of M. Cherville's in the *Temps* of October 22, it seems that Dumas had four secretaries, one of whom was specially charged with the care of his creditors.

—The perennial subject of Washington society, after having been discussed sensibly and very readably by Mr. D. D. Lloyd, the *Tribune* correspondent, in the October *Manhattan*, comes up again in the December *Atlantic*, this time in the hands of Mr. H. L. Nelson. Mr. Nelson thinks the society of the capital has been maligned, especially by the authors of three novels which he names; but it seems to us that many of his points are not well taken. We are far from disputing the fact that charming non-official society exists in Washington; but when Mr. Nelson asserts that this portion of Washington society is predominant in any sense, except that of deserving to be, he certainly is in error. "There is a vulgar side to Washington society," he says; "there is a vulgar side to the society of every city in the country. There are coarse and untrained people even in Boston," and so on. True, but in Washington these "coarse and untrained" people have, so long as it lasts, great power, of which they are fully conscious. They feel, and not without reason, that Washington is theirs, and that the "cultivated" people live and move in Washington only through their sufferance. As to corruption, we believe as little as Mr. Nelson that Washington ladies aid or abet it; but then we should not say, as he does, that they "hate" it. Familiarity breeds contempt, and association with jobbers and knowledge of their schemes, however startling at first, in time makes both appear in the natural order of things. This state of mind is not, of course, peculiar to Washington—the condoning of jobbery, as well as of railway frauds and bank defalcations, is common throughout the country; but in Washington there are ten persons with something peculiar in their "record" to one elsewhere—which fact is often consistent with their being well worth knowing, and proportionately sought. In seeking to show that politics, in one shape or another, is not the ever-present interest in Washington, Mr. Nelson assumes what would be possible only on the supposition that there is in Washington a coterie, sufficiently large to be called "society," which occupies the same relative position as the French royalists; and this, we think, is not the case. "The stock Congressman of writers of fiction," he further remarks, "does not exist. He cannot even be compiled from the vices of all the wicked men who have cajoled their constituents into voting for them." Yet this was precisely the answer—and a very good answer—made by the Congressional world to the truthfulness of the hero of 'Democracy,' as a type—that the character was a patchwork of incidents from the lives of Douglas, Seward, Morton, and some others—the singular parallelism of an important episode to an event in the life of Mr. Blaine being in anticipation of the fact. We are of the opinion, moreover that if Mr. Nelson will frequent the lobbies of the Capitol as much as he apparently has done the drawing-rooms of the West End, he will not be long in discovering the "stock Congressman" aforesaid, and in finding in him social traits which no novelist would venture to put upon his pages.

—The State Charities Aid Association has the legal right to visit, inspect, and examine all charitable institutions supported at the public charge in this State, and it is required to make an annual report to the State Board of Charities. Very recently it has published a small and excellent 'Handbook for Hospitals,' primarily for the use of its visitors. It is also a public good. It must be of peculiar value for those benevolent persons who officially inspect these collective homes of the sick, often without accurate knowledge as to what should and should not be. There are few more embarrassing positions in which to put a well-meaning man than to make him an inspector of a special service to which he has not been educated. Study of this book will divert inquisitive energy into profitable channels. But its peculiar value—and in this it stands apart in secular literature, so far as we know—is that it gives in small compass and plain language nearly all the information that a local organization would require in establishing and successfully managing a minor or village hospital. It wisely suggests that such an institution be called a House of Mercy, or Sheltering Arms, or by some similar title, to divert the ordinary association of hospital from those whom it would benefit. It is not difficult to buy a house and call it a hospital and to find a physician to prescribe gratuitously for its inmates. But it is very hard to find a person competent to plan a building, and especially to manage it, in the proper interest of the sick. This little book is a stimulus to such work, and at the same time it shows the way. We may not quote, for want of space, some of the pithy remarks that are scattered through it. It properly praises the common-sense virtues, and deprecates equally machine charity and intemperate sweeping, while extolling the brotherhood of man and insisting on eternal vigilance as the price of health and cleanliness. Perhaps it has an undue bias toward exalting the "head nurse" at the expense of the "young doctor," but the latter will probably outgrow it. A secondary motive that runs through the book is its showing the extreme adaptability of women as hospital managers, concerning which, not accepting the accomplished writer as an average example, there may be two opinions.

—The magnificent scientific bequests of the late Mr. Lick of California are within the memory of all. The chief specific amount was to be devoted to the construction of a telescope of extreme power, and the equipment of an Observatory on Mount Hamilton, California, and was no less than seven hundred thousand dollars. After the complete payment of all the specified bequests, the residue is, by the terms of the deed of trust, to be divided between the California Academy of Sciences and the Society of the Pioneers. The vexatious suits entered upon by the supposed heirs of Mr. Lick were successively decided by the courts, and at last a definite construction of the deed of trust was made by the Supreme Court of California, from which there is naturally no appeal, and in pursuance of which the Trustees are now acting. Thus far, their energies have been largely concentrated on the execution of the Observatory trust, and they have expended therefor the sum of $155,000, up to the 1st of October. This expenditure has given them already a well-equipped Observatory on the summit of a bleak mountain, nearly a mile above the sea, and twenty-six miles from the nearest town, and their instruments have already made very valuable contributions to astronomy on the occasions of the last transits of Mercury and Venus. This same amount includes several payments on the large instruments not yet received from the makers, the construction of comfortable dwellings near the summit, and the provision of an ample water-supply in complete working order at that great elevation. Any one who has visited the mountain cannot fail to have noticed how thoroughly the Trustees have done all their work, and his chief query is how so much has been accomplished for so small a sum. The Trustees anticipate the completion of their labors connected with the Observatory on the expenditure of about one-half the entire amount of the bequest therefor, thus leaving about three hundred and fifty thousand dollars for an endowment fund for the support of the Observatory perpetually. The wisdom of the Trustees in the execution of their policy, under the presidency of Mr. Richard S. Floyd, is very apparent when looked at without prejudice. Had they sold their enormous properties as soon as the litigations were over, and at the time of a great shrinkage in the values of the real estate involved, the residuary legatees must have received nothing from Mr. Lick's bequest. The comparatively recent growth in the valuation of the properties held by the Trust will now give the Pioneers and the Academy nearly one hundred thousand dollars each; and it is impossible to recognize, in the lack of immediate benefit, any sufficient

ground for their continued attacks upon the Trustees, with which the San Francisco papers are periodically flooded. Obviously their complaints are entirely to no purpose, for the Trustees are acting in pursuance of the orders of the courts, and a disobedience of these orders would insure their speedy dislodgment from their very responsible positions. A late number of *Science* reviews the policy of the Trustees, making it plainly evident that their administration of Mr. Lick's estate is, thus far, worthy of the highest commendation.

—Mr. John Morley's successor in the editorial chair of the London *Pall Mall Gazette* is a gentleman who is described as having a genius for newspaper editing, and during the short time that he has occupied the position he has introduced a number of original and admirable features. First among the novelties came the habit of illustrating any article or despatch with a diagram, map, or illustration, as might be most appropriate, in most cases apparently set up by the compositor with the means at his disposal, from rough sketches probably embodied in the "copy" sent up. Next it became evident that some one of a mathematical and statistical turn of mind had joined the staff, for a series of comparative statistical abstracts and tabular views of all kinds began to appear. These are frequently very original and instructive, and the most striking of them has been a series of tabular views of the "tips" for the great English races given by the sporting prophets of a large number of newspapers, compared with the actual results of the races, thereby affording absolute and crushing demonstration of the utter untrustworthiness of the forecasts. This ruthless application of mathematics to sport has naturally provoked much anger among the racing community. Another innovation is the presence of a signed article by some well-known writer in almost every issue. A great success has been achieved by a number of short popular guides or handbooks, at twopence each. These have been a 'Guide to the Royal Academy,' a 'Handbook of the Cholera,' a 'Guide to the Fisheries Exhibition,' and another just announced—'Christmas Presents: What to Buy, and Where.' These are called *Pall Mall Gazette* Extras, like the *Tribune* Extras, and of the one on the Fisheries Exhibition no fewer than 158,000 copies were sold. Among other new features, a daily list of books and pamphlets received during the preceding twenty-four hours is not the least convenient. With such clever editing and its dignified and cultivated tone, it is not too much to say that the *Pall Mall Gazette*, as the mouthpiece of advanced Liberalism, is the most satisfactory daily newspaper in England at the present time. Politics apart, the *Standard* is by far the best London morning daily.

—Mr. Archibald Forbes, in the October number of the *Nineteenth Century*, gives to the readers of that journal a very suggestive article on "The Present and Future of the Australasian Colonies." The interest of his discussion centres in the following points: In the first place, his observation teaches him that the love of the people in those remote colonies "for Victoria and her race, has a glow of personal warmth in it such as does not usually burn among subjects clustered closer on the confines of the royal circle." He found that every public speaker who would sit down on good terms with his audience would "weave into his peroration expressions of devotion to the Crown, of congratulation that Australia lives under the flag of 'the Empire,' and of fervent hope that this shall ever be so." This patriotic devotion even goes so far as to be positively intolerant. No speaker, he says, could hold in Australia the tone often held by speakers in England in regard to the independence of Ireland. The Redmond brothers visited that continent last year to raise money for the Irish cause; but on the very threshold they learned that they could not speak in Australia as they were wont to speak at home. They were obliged to strike a lower key, to speak respectfully of Britain's sovereign, and to conclude their meetings with the national anthem. Hall proprietors, with whom the rent is the main object of interest, declined with emphatic unanimity to lease their platforms to the agitators, who had to harangue in remote, inconvenient Roman Catholic schoolrooms. Certain members of the Victorian Parliament, persons of Irish extraction, framed an address to Mr. Parnell in which there occurred the words "foreign despotism." So fierce was the indignation that denunciatory meetings were held in every township of the territory they represented. At the next general election four out of the five who had perpetrated the outrage on colonial loyalty lost their seats. This patriotic fervor, moreover, shows itself in things big and in things little. It is manifested in the accent of the lower classes; in slow, heavyish walk; in the fondness for the old-country drinks even in spite of hostile climatic conditions; in the full side-face whiskers; in the sporting tastes and the fondness for athletics; in the active habits of the women, "who are as keen on lawn-tennis with the thermometer at 100 in the shade as our girls are when it marks 'temperate'"; in the universal British preference of compartment carriages in railway travel; in "the addiction to being accompanied in the compartment by portmanteau, handbag, a bale of rugs and great coats, and a fascine of walking-sticks and umbrellas"; "in the burning zeal for writing letters to the newspapers on personal petty grievances, on abuses which the American curses at while suffering and forgets the moment they are over"; and "in the intensely British fervor of the newspapers, with their rotund 'we,' their mathematically three-paragraphed leading articles, their fine, manly, wooden holding aloof from a certain vein of news which, no doubt, would be interesting and indeed useful, but which might incur the reproach of trenching on the personal."

—But though this loyalty is conspicuously everywhere prevalent, Mr. Forbes is of the opinion that it is a mere sentiment, which will be inadequate to save the colonies in case the mother country should become embroiled in foreign war. Such an event, in his opinion, would bring on the Australian colonies the most wide-ranging and terrible mischiefs. In proof of this he cites the haste with which Russia made preparations for sending into their waters a fleet of swift cruisers equipped in American ports when war with Great Britain seemed imminent in 1878. If such a war should ever come, the empire would be obliged "to uncover its flanks for the protection of its centre." The colonies would have to be left to themselves, because the whole of England's fleet would be needed nearer home, mainly to protect her coast line, in these days of steam, against the sudden raid of cruisers aimed at her unprotected coast towns. Hostile men-of-war would haunt the Australian waters, and, coaling in the neutral ports, would find easy access to the minor but far from unimportant coast towns. The resulting struggle, Mr. Forbes goes on to show, "would dislocate Australasia commercially all along the line," and this would be followed by the common repudiation of the suzerainty now somewhat vaguely exercised by the British crown. Finally, he declares that his study of the colonies has brought him to the "implicit conviction that if England should ever be engaged in a severe struggle with a Power of strength and means, in what condition soever that struggle might leave her, one of its outcomes would be to detach from her the Australian colonies." This done, the formation of a confederation of the colonies would be the natural and perhaps the necessary consequence.

—The announcement from Germany of the discovery, in a bookseller's collection, of an unknown product of Gutenberg's press, illustrates with what facility German bibliographers have always credited to Gutenberg any anonymously printed book of the 15th century. The work in question, which has for its title, 'Clagen und nutzliche lere aufs gemeynen beschriebenen rechten,' judging from the description given by Ilgenstein in Petzholdt's *Neuer Anzeiger*, probably belongs to a group of tracts commonly reputed to have been printed by Gutenberg from 1461 to 1463. This date has been assigned chiefly in consequence of Prof. Fischer's so-called discovery, signalized in his 'Essai sur les monumens typographes de J. Gutenberg' (Mayence, 1802) of a copy of the 'Tractatus de celebratione missarum,' in the University Library at Mentz, bearing a rubric denoting that the tract was completed by Gutenberg's press in 1463, and by Gutenberg and Nummeister (supposed to be an assistant of Gutenberg), presented to the Carthusian Monastery at Mentz. The 'Tractatus' is one of the seven or (counting the new example) eight pamphlets which, from their general typographical correspondence, are classed as nearly contemporaneous productions. The discovery of fraud in the Prognostication or Kalendar, reputed by bibliographers to be for the year 1460 (and consequently printed in 1459), by J. H. Hessels, who has, by his thorough investigations, done more than any one to clear away the mystifications and misconceptions relative to the invention of printing, removes this whole set of publications from the list of Gutenberg's *incunabula*. A reference to Pope Sixtus IV., who was elected to the Papacy in 1471, in a book professedly treating of events to occur in 1460, caused Mr. Hessels to examine closely the date in the text, which resulted in finding that, by the scratching of four numerals, 1482 was made to appear as 1460. This discredits Prof. Fischer's statement, which has hitherto been generally accepted by bibliographers. The copy which he described has unaccountably disappeared. Two forgeries in connection with this handful of books, so long undiscovered, show, as Hessels remarks, how little the Germans have done in the Gutenberg case, except to repeat old stories, without even looking at things right at their elbow. Gutenberg died in 1468, and the disposition of his types after that time is involved in doubt, so that it is not possible to assign with surety the printing of the tracts under consideration.

—Testimony in favor of Gutenberg from the other side of the Rhine is of course less open to suspicion, and such is to be found in a remarkable communication to the November number of *Le Livre*, by A. Claudin. This investigator calls attention to a piece of evidence which has heretofore passed unobserved of all the historians of the art of printing. The Savoyard Guillaume Fichet, in a letter addressed to Robert Gaguin, and printed at the beginning of copies of the small quarto 'Gasparini Pergamensis orthographiæ liber' (the second book printed in Paris), celebrates the influx of printers from Germany, bringing a "great light" with them, and relating, as to the origin of their art, that "haut procul a civitate Mogontia Joannem quendam

fuisse, cui cognomen Bonemontano, qui primus olim impressoriam artem excogitaverit, quare non calamo . . . neque penna . . . sed æreis litteris," etc. Fichet goes on to advocate the apotheosis of this inventor of metal letters, and has a flattering word for Gutenberg's skilful disciples, Martin Krantz (of kin, concludes M. Claudin, to the Peter Krantz who figured as a witness in Gutenberg's second trial at Mayence), Michael Friburger, and Ulric Gering, who had come to Paris on the invitation of the Sorbonne, and who in fact printed the very book in which this tribute is paid to their master. M. Claudin, by the way, has ascertained that in 1461 Michael Friburger and Ulric Gering were students at the University of Bâle, along with one Gabriel Krantz of Stein. He fixes upon the close of the year 1470 as the date of Fichet's letter, on grounds which appear probable if not incontestable. At that time, as already pointed out above, Gutenberg had been dead only two years.

—Professor Baermann made his first appearance before a Brooklyn audience at the second rehearsal and concert of the Philharmonic Society. He enjoys an enviable reputation in Germany, and the musical people of Boston, his present home, are as devoted to him as New Yorkers are to Mr. Joseffy. For his début he chose Beethoven's Fifth Concerto, and it is safe to say that there were few in the audience who had ever heard that work interpreted in such a thoroughly artistic, honest, and impressive manner. Herr Baermann takes his place at the piano with the confident air of a German professor who is a thorough master of his subject and knows the whole score by heart. He is not one of those virtuosos whose only aim is to make a sensation by means of feats of agility. He merges his individuality in that of the composer, and one of the greatest charms of his playing is the manner in which he places in *mezzo-relievo*, as it were, subtle shades of meaning that are slurred over by less conscientious pianists. At the same time he is fully equal to the highest technical demands, his scales, arpeggios, and trills being delightfully even and smooth, while his touch varies with the character of the music—now light and graceful, and again grandiose or tenderly poetic. Prof. Baermann does not appear to have any specialty in which he defies competition (as Joseffy with his pianissimo cobweb style), but his playing is distinguished by an even and impartial excellence in every respect. His reception was very favorable, and at the concert he acceded to the tumultuous request for an encore which he denied at the rehearsal, although some of the ladies almost ruined their gloves by applauding. Mendelssohn's "Midsummer Night's Dream" and Schumann's First Symphony completed the programme, being separated by the concerto. Of the twelve numbers which make up Mendelssohn's composition, only seven were given, but among them were the most popular ones—the overture, scherzo, nocturne, and the famous Wedding March, so full of associations to those who did not follow *Punch's* advice. In the finale and another number Mrs. Denniston, Mrs. Hartdegen, and the ladies of the Philharmonic Chorus supplied the vocal music in an eminently satisfactory manner. And as for the orchestra and its leader, they appeared to be positively inspired, especially in the Schumann symphony, which has probably never before been played with such exuberant vigor and perfect rhythmic swing. The "Midsummer Night's Dream" is one of Mendelssohn's most finished productions, but when one hears it in such close juxtaposition to Schumann's great symphony one feels vividly the great difference between the genius of the two composers. The texture of Mendelssohn's harmonies and melodies has lost much of its original freshness, while Schumann seems more fascinating and invigorating than ever. Schumann's future in our concert halls may be represented by a crescendo sign, Mendelssohn's by a diminuendo. Not only are Schumann's ideas more virile and original than Mendelssohn's, but his style is much more suggestive, condensed, and epigrammatic. On one page of his score he has more matter than Mendelssohn on ten of his. This makes him the greater poet of the two, for the essence of poetry, as of wit, is brevity—the art of condensing a great idea or image into a few well-chosen words, and the avoidance of mechanical repetition. Schumann's First Symphony may lack the formal polish of his later ones in a few places, but as a whole it has no superior in all symphonic literature, and it differs from most symphonies in the fact that all its movements are interesting. In arranging the programme, Mr. Thomas probably felt that for the majority of the audience it would have been better to place the symphony at the beginning of the programme, when the hearers' receptive faculties were still fresh. But for the musical "remnant" Mendelssohn would have sounded too tame after Schumann and Beethoven; and it is the musical remnant, in such a case, who must be considered by an ideal conductor.

MR. SEWARD'S DIPLOMACY.

The Diplomatic History of the War for the Union: Being the Fifth Volume of the Works of William H. Seward, edited by George E. Baker. Boston: Houghton, Mifflin & Co. 1883. 8vo.

MR. SEWARD'S "optimism" became almost a by-word during the civil war. His cheerful faith that the war would be a short one, that each campaign in turn had exhausted the aggressive power of the rebellion, and the hopeful view of all aspects of public affairs which he habitually took, were treated as amiable and rather comfortable idiosyncracies, which permitted many a public and private critic to flatter himself that his judgment was much better than that of the Secretary of State.

Whoever will turn over the leaves of the Diplomatic Correspondence, even cursorily, will find growing upon him a sense of the responsibilities of the statesman in charge of our foreign affairs at that period, which becomes a burdensome weight in the mere thinking of it. As one reflects upon it, the sympathy with the task Mr. Seward had before him becomes pathetic and almost painful. At the outset he was to choose the form in which Mr. Lincoln's administration should present to the governments of the world the terrible fact of an insurrection of a dozen States, and nearly as many millions of people, against the national unity and power. Nearly every great Power on the globe was a monarchy, and, by the traditions, the instincts, and the assumed interests of its rulers, was disposed to hail the outbreak as an expected, if not wished-for, downfall of the only experiment in republicanism on a great scale—a collapse which might add centuries to the era of conservative rule, and delay for ages the assimilation of European governments to the democratic institutions of the western continent. Mr. Seward saw with absolute clearness that from nearly all the great Powers he must expect cool courtesy, covering an almost feverish readiness to regard secession as an accomplished fact. The motives might be various, but the wish for our final disruption would be all but universal. With some, the magnitude and unrivalled preponderance of the United States on this continent would lead to the desire to see several rival nations here, keeping each other busy with their jealousies and conflicting interest, and, by their armies and navies, excusing the immense military establishments by which the peoples of Europe are burdened. With others, the hope of close and profitable commercial relations with a Southern republic, furnishing one of the greatest staples of commerce and manufacture, was the attracting force. But whatever the reasons given or disclaimed, whatever the good-will professed with more or less of warmth, from the day he took the portfolio of State, Mr. Seward knew that the ministry of every monarchical government in the world was inwardly content with our misfortune, and looked with satisfaction to our probable permanent disruption.

We have no cause for enmity on this account. It was in the nature of rival systems of government that it should be so. As we ourselves should look with satisfaction upon any solid progress of sister nations toward lasting and peaceful republicanism, we should be weak not to recognize the fact that earnest monarchists would not be grieved at a demonstration that democratic institutions are not adapted to great national organizations, even if they be tolerable in petty communities. The crisis of our trouble brought all these sentiments to the surface. The claim of Mr. Lincoln's administration to high statemanship is solidly founded on its treatment of foreign affairs, and the Secretary of State is fully entitled to the credit of impressing his own character and intellect upon the successful diplomacy of the period.

Mr. Seward's first work was to give unity of tone and spirit to our legations abroad. He deliberately adopted it as a canon for all his diplomatic subordinates, that the republic must not be despaired of. A high, hopeful, confident spirit was inculcated both by precept and by example. That his letters to our ministers and to foreign governments might not be weakened by inconsistent utterances at home, he threw the same cheertulness of spirit into his private and public conduct, and refused by word, by tone, or by look, to admit the possibility that it could be within the designs of Providence that our national Government should be destroyed. It would be hard to overestimate the influence of such a spirit, in such a man, in such circumstances. Fully in harmony with Mr. Lincoln's way of viewing things, it strengthened the President's hands, and made the influence which went out from the leading men of the Cabinet always certain in tone, never doubtful, never despondent. If his natural temperament had not helped him to his bright views of the future, it would have been a masterpiece of policy and of will to have feigned them; but he was really hopeful, and saw also the full advantage of letting his professions of confidence come fully up to feelings which he nourished and cultivated.

His first despatches to our ministers abroad were necessarily variations on one theme; but each was carefully adapted to the character and temper of the court to which it was indirectly addressed. To France, he could dwell upon the great part that nation had taken in the establishment of the United States as an independent Power, and the shame it would be if she should now become a willing instrument in its dissolution. To England he gave appropriate reminders that the vast colonial interests of the British Empire made it peculiarly the policy of that Government to uphold the authority of national governments against unjustifiable insurrection; and used with much force the argument that she could not afford to be the champion of a revolu-

tion based on human slavery. For each of the other governments he found some fitting argument or appeal, hinting plainly to all, that any unfriendly intermeddling would be hazarding the good-will of a great nation upon the doubtful chance of the success of the insurrection.

The first battle of Manassas soon came to mar his plans and beget discouragement in nearly all our foreign representatives, while it developed a joint purpose in England and France to recognize the Southern Confederacy as a belligerent power. The Secretary redoubled his energy. He ably analyzed the battle itself, showing that the power of the republic had been demonstrated in the array of a great army, which seemed to have victory in its grasp when the panic to which all new troops are liable came to make a disaster that was not a military defeat. He combated the dismay of some of his subordinates, rallied them to their work as a brave general would rally his troops, and, by a high and courageous tone, manifestly checked the tendency among foreign Powers to recognize the independence of the Confederacy.

Next came the *Trent* affair to complicate the situation. The capture of Mason and Slidell was looked upon by the country as a victory in itself, and this made it doubly hard for the State Department to disavow the act of Captain Wilkes, and to follow the course which real wisdom pointed out. Mr. Seward's quick apprehension instantly saw that the very *éclat* of the capture made it the more likely that it would be the pretext for hostile action. He was profoundly convinced that no advantage gained from the possession of the envoys could balance the mischief we should suffer from an open quarrel with England. This meant the raising of the blockade, the subsidizing of the Confederate Government and supplying it with arms. There was a chance that, like revolutionary France in 1793, we might have made ourselves all the more formidable on this continent if we had been opposed by a world in arms, but it would be risking too much upon desperate odds, and the President and Cabinet accepted Mr. Seward's view, so that his part was taken before any unfriendly summons could reach us from Great Britain. He very ably used the traditionary American policy of "neutral rights" to quiet the popular clamor at home, while he most skilfully exposed the inconsistency of the British complaint with the sweeping doctrine of the "right of search" of which England had been the inveterate champion. He was thus able to avert a new storm, while he signalized with new emphasis the American championship of what had been the cause of the rest of the world against the great maritime Power. The surrender of Mason and Slidell thus took the character of adherence to an old principle on our part, coupled with an ungracious abandonment of its ancient rule of action by the English ministry. These, being put thus in the wrong, appeared to have been using a poor pretext for a quarrel, in regard to which European statesmen should be the first to understand the inconsistency.

The French invasion of Mexico, and the effort to put Maximilian upon a throne there, were treated with similar skill. The recognition of the republican government was steadily continued, every overture to treat Maximilian as a successful invader was firmly declined, the invasion itself was clearly characterized as an unfriendly act to us which only our troubles at home made us endure, and plain intimations were given that it was well understood that the Emperor was merely practising upon the chances of the success of the Confederacy. It was Mr. Seward's peculiar triumph that at the close of the war of the rebellion, he was able, without violating the forms of diplomatic friendliness, to draw about the French Emperor such lines of moral constraint as to force a humiliating desertion of Maximilian to his fate, which was a sore stroke to the prestige of Louis Napoleon, and which restored the republican government in Mexico without a blow.

The question concerning the *Alabama* and other Confederate cruisers was perhaps the most difficult and trying of all. The popularity of the Southern cause among the middle and upper classes in England was such that an apparently strong popular sentiment supported the plain violation of neutrality, and made many of the Government officers singularly oblivious even of the outward and decent show of respect which they owed to their own neutrality laws. The co-operation and mutual understanding between Mr. Seward and Mr. Adams were perfect. Both were cool, both were persistent, neither allowed any rebuff or half insolence to turn him from his purpose. The evidence of the hostile purpose for which the ships were built was most diligently collected, and courteously but firmly forced upon the attention of the Government. The proof of the mischief the cruisers did, and the unwelcome list of claims for indemnity, were also from month to month produced and pressed. The frankness with which ministers were told that we were quite aware that for the present we must rely wholly on the sense of justice of the British Government to recognize these claims, connected as it was with the continued and unsparing addition of the new items of damage as they occurred, was more powerful as a warning of future complications than any amount of bluster would have been. Others knew as well as we knew ourselves that we were in no condition then to resent an injury which could be borne at all; but they also knew that if by chance the rebellion should not succeed, a great nation, doubly strong in the consciousness of its proved military power, and in the belief that it had been wronged, would be inevitably impelled to demand redress. The very patience and ability to wait which the Secretary and the ambassador displayed, produced more moral effect than any evidence of irritation could have done. And this effect was not altogether postponed. After the critical midsummer of 1863 it was pretty evident that Confederate bonds payable at the recognition of the Confederacy by the United States were not likely to be worth as much as *Alabama* claims payable when the unity of the American people should be reëstablished. The duties of neutrals were not made to appear so small, or the neglect of them so trifling, a matter as before. Officials could more easily be made to see the evidence of hostile purpose in the construction of war-ships, and it did not seem so nearly a joke that ship and armament were only to come together off the Azores.

It is curiously interesting, now, to run over the diplomatic correspondence, and notice how the calm temper and even tone of the protests and reclamations gradually produced their effect; to note the unflinching steadiness and unwavering faith in the success of his country's cause gradually becoming the historic fact, in Mr. Seward's letters, as month after month rolled on. His policy was to make plain the fixed opinion of our Government that unfriendly things were done in an unfriendly spirit, but to tone so carefully the character of the reclamations that no offence could be taken at them, while they continued to be part of an ever-growing debit account of which the settlement was only postponed.

The period of Johnson's administration was used by Mr. Seward in the same spirit, without haste but without intermission of purpose, to produce the conviction that the claims of the United States were quite too grave an item in the national accounts to remain open when the contingencies of European politics were complicated with the controversies which ended at Sadowa and Sedan. He wished for and intended to bring about a peaceful solution of our controversies with England as with France; but he was determined also that it should be in such form that when the whole was ended the record of it should be one that every American could read with pride, while foreign politicians should be forced to see humiliating blunders and inconsistencies at every step of their intervention in the great struggle on this continent. If the very last part of the settlement at Geneva was not under Mr. Seward's direction, it is no disparagement to his successor to say that it was foreshadowed and fully prepared in his conduct of negotiations during the eight preceding years, and was the natural consummation of his policy.

His negotiation of the purchase of Alaska and the cession of St. Thomas was part of the same noble ambition to show the world that so far from being crippled in power or shorn of substantial wealth by the great war, the United States Government was feeling more than ever competent to dominate the continent and control affairs in all the adjacent seas. It was a high-spirited answer to those who affected to treat it as an open problem whether our resources had not been exhausted, and the burden of our war debt become so crushing that America could be counted out of the world's politics for a long time to come. It was a mistake to extend the policy of annexation beyond the main land of North America, for many reasons. It would be equally a mistake to reach for regions not preoccupied with peoples of kindred habits and of similar progressive spirit. But Mr. Seward's diplomacy need not be regarded as the adoption of a purpose of indefinite extension so much as an easily understood and strong response to the enemies of republican institutions everywhere, which answered its purpose thoroughly by removing all doubt about the confidence of real statesmen of this country in our future, and their determination to accept no second place in the ranks of nations.

The unhappy circumstances which surrounded Mr. Johnson's administration have prevented his countrymen from estimating Mr. Seward's services and his statesmanship at their true worth, but this publication of his works will give the means of judging more fairly; and it will not be a great while before all parties will be in accord in placing his name securely among the few public men who have been equal to a great era in which they lived.

ENGLISH VERSE.

English Verse. Edited by W. J. Linton and R. H. Stoddard. Vol. i. Chaucer to Burns. Vol. ii. Lyrics of the Nineteenth Century. Charles Scribner's Sons.

THERE lie before us two volumes of a new anthology of English poetical literature. Three more are to follow. It is claimed by the publishers that this collection is to be "the largest yet undertaken"; that its five volumes will be more convenient than one large one; that "its division and management are simple and excellent"; that "each volume is supplied with careful indexes of authors, poems, and first lines." It is also stated that "as the work was directly suggested by the defects of the existing anthologies," it is greatly to surpass them in compre-

hensiveness and in "absolute accuracy of text." Such an announcement implies a work of much literary importance.

Unfortunately, as our public buildings are apt to suffer from the presence of too imposing doorways, a literary enterprise is often damaged by too magnificent a prospectus. But for the above announcement, the present collection would have taken its place on our shelves as one of quite the average excellence. It is the inordinate claims made for it which provide a standard by which it fails. As we go through the above points of self-commendation, we are reluctantly compelled to record a dissent from almost every one. It is not yet apparent that this collection is to be larger than others before made—notably Ward's 'English Poets'; and it is not in the slightest degree to be compared to that in fulness of annotation and criticism. It is certain that five volumes are not so convenient as one volume, for the reason that it is doubtful, even under a chronological arrangement, in which volume you are to look for a particular poem; and when the arrangement is not even chronological, but one volume contains "From Chaucer to Burns," another "Lyrics of the Nineteenth Century," another "Ballads and Romances," another "Dramatic Selections," and another "Translations," the task is simply bewildering. There is many a little poem of which—as in case of Longfellow's "The sea hath its pearls"—not one reader in ten can remember off-hand whether it is a translation or no. It may be classed as a "ballad" or as a "lyric"; indeed, when we consider that this collection includes sonnets as lyrics, the distinction between the volumes amounts to very little. The mere indefiniteness of the classification must make the use of the five volumes exasperating, we should say; and, to make the matter worse, the promise of the prospectus as to indexes is not kept. In neither of the two volumes before us is there any pretence at an alphabetical index of authors, and for want of it the reader has to fumble over the pages, again and again, to ascertain where his favorite poet lurks concealed. True, the arrangement is chronological, but the reader cannot carry all his chronology in his head; that is, indeed, part of what he consults the book to ascertain.

As to "comprehensiveness," it is the invariable stronghold of every new anthology. It simply means that each editor puts in what he likes best, so that—to paraphrase President Lincoln's immortal remark about the lecture—for those who like just that kind of collection, it is just the kind of collection that they will like. Until each man can make his own *florilegium*, none will ever be quite satisfactory—neither Emerson's, nor Whittier's, nor Dana's, nor Fields's, nor Sargent's, nor Miss Bates's, nor that of Stoddard and Linton. When the present editors assure us that "all the unquestioned and familiar masterpieces" are retained, the dissatisfied reader shakes his head. "Where," he asks, "are Leigh Hunt's 'Jenny Kissed Me'; Landor's 'Rose Aylmer'; Montgomery's 'The Common Lot'; Dornett's 'Christmas Hymn'; Dobell's 'Keith of Ravelston'; Taylor's 'Incident of the Crimean War'; Platt's 'The Morning Street'?" If these are not the "unquestioned and familiar masterpieces" of their respective authors, nothing is. They offer in each case a high-water-mark, almost as distinct and unequivocal as Holmes's "The Chambered Nautilus." So long as they are omitted, the claim to especial comprehensiveness is merely a publisher's puff. Thus, at least, will reason those who prefer these particular poems; and very possibly, if Messrs. Stoddard and Linton had put in these, there would be still many to claim that masterpieces yet more thoroughly unquestioned were left out.

We have no doubt that much work has been faithfully done by Mr. Linton, as the publishers claim, at the British Museum and elsewhere, in comparing and verifying the texts of some of the less-known poems. This work we must take upon trust; the trust being unfortunately impaired by the fact that, in case of the better-known poems, there are such repeated instances of inaccuracy as to awaken very serious doubts in respect to the standard prevailing in the rest. Where the parts seen are questionable, we cannot always walk by faith as to what is unseen. Let us consider, for instance, one of the best-known poems—perhaps the best-known—in English literature, Gray's "Elegy." The text of the poem has been very amply discussed, and of late critically edited by Mr. W. J. Rolfe. The *pros* and *cons* of the various readings are well known. There is a facsimile of Gray's manuscript in Mathias's edition, published in 1814, and it is generally admitted that this, commonly called the Pembroke MS., represents the maturer form of the poet's work, and that the Wrightson MS., which in some respects varies from it, is a rough draft. Now, the version given by Messrs. Linton and Stoddard varies in three important readings from the Pembroke MS., and in two cases the variation is an entire novelty, so far as we have examined. In the other case the same error is to be found in many of the earlier editions, but not in the earliest, and, since Mr. Rolfe's edition appeared, we supposed that Gray's own reading was accepted by all. The passage to which we are now speaking is as follows:

> "The boast of heraldry, the pomp of power,
> And all that beauty, all that wealth e'er gave,
> *Awaits* alike the inevitable hour;
> The paths of glory lead but to the grave."

In Gray's manuscript, and in the first collected edition of his poems (1768), the word "awaits" appears. In the first edition of his letters and works, published after his death, by Mason, in 1775, it is transformed to "await," and has been commonly so printed ever since until very lately. One would suppose that a mistake of this kind, once corrected from the author's MS. and from the collected edition published in his lifetime, would remain permanently amended; yet 'English Verse,' without a word of explanation, reverts to the accustomed error and has "await."

In the two other cases, the new editors seem to make themselves alone responsible for the changes they introduce. For instance, the line which appears in Gray's MS. as

> "The short and simple Annals of the Poor,"

they render,

> "The short *but* simple annals of the poor."

The alteration seems meaningless. "Short *but* simple" adds nothing to the meaning. Why should not that which is short be simple? The collective edition of 1768 has "and"; so has every later edition which we have examined. Again, two verses further on, Gray's MS. has

> "Nor you, ye Proud, impute to These the fault,"

this being substituted for a line abandoned by the poet. 'English Verse' gives—

> "Nor you ye proud impute to *them* the fault."

Here, again, the new version varies from all previous printed versions that we have inspected. Why these variations? Careless transcribing would be the most obvious solution. If this is not the source, the only other explanation possible is that Mr. Linton inspected the Wrightson MS., found these variations there, and substituted them, without regard to the general opinion of critics that this manuscript represents only the rough draft of the poem. In that case, he was bound to explain the fact in his notes, as he has explained matters of far less importance. No one has a right to tamper, without explanation, with the received text of a poem which we all learned by heart in childhood. To the rest of the 'English Verse' text of the "Elegy" we take no exception, save the revival of the now nearly obsolete spelling of the word "tenour" instead of "tenor." Why follow the spelling of the poet's time in this word any more than in "rhimes" or "ev'n"? The collected edition of 1768 has "tenor"; why not adhere to it?

Let us now turn to the volume of 'Lyrics of the Nineteenth Century.' On page 270, a line in Rossetti's "Lilith" is thus printed:

> "The witch *beloved* before the gift of Eve."

It should be "he loved." In the same poet's "The Card-dealer" (p. 268), we find

> "And he were rich who *would* unwind,"

where the "would" ought to be "should." Again, a line of his "True Woman" (p. 271) is thus given:

> "The wave-brown'd pearl—the *heartshape* seal of green."

Here the word should be "heart-shaped." Again, Thomson's poem, "The Three that Should be One," contains a line (p. 301),

> "Love kissed *her* swoon away."

It should be "the swoon." One of the lines of Tennyson's "Tithonus" is here printed (p. 176):

> "Are all *my* lights and cold my wrinkled feet."

This should be "thy lights."

We make little account of obvious misprints, such as "neek" for "neck" in Nicoll's poem of "Menie," ('Lyrics,' p. 196), or "Twins stars" for "Twin stars" ('Lyrics,' p. 227); but it is something more than a typographical error which utterly spoils a rhyme, as in Barry Cornwall's verse ('Lyrics,' p. 76):

> "With tongues all sweet and low
> Like a pleasant rhyme,
> They tell how much I owe
> To Thee and *Thine*."

Reference to any edition of Barry Cornwall will show that the last line should read

> "To Thee and Time."

We pass over also the difficult question as to how far the Scotch dialect should be followed or modified; and whether of Burns's two distinct forms of "The Banks o' Doon" the later or earlier should be given. The version of "The Flowers o' the Forest" (p. 279) bears marks of being drawn from an earlier copy than that transcribed, or possibly transformed, for Scott's 'Border Minstrelsy'; but since Scott tells us expressly (iii., 127) that the first line of the poem is far more ancient than Jean Elliot's verses, there seems no reason why this should be changed. Scott gives it as

> "I've heard them lilting at our ewes' milking";

but 'English Verse' (p. 279) gives it thus:

> "I've heard *the* lilting at our yowe-milking."

"Yowe" is well enough, but "the" is questionable.

Looking next at American poets, we find three wholly new and unexplained readings in the extracts from Emerson. In the short poem "To Eva" we have ('Lyrics,' p. 140):

> "Features that seem *in* heart my own,"

and

> "*Which* charm the more their glance forbids."

In these cases the words should be respectively "at" and "who." Again, in "The Problem" (p. 137), we have the line,

> "Of leaves and feathers from her breast,"

where the sense is bewildered for want of a comma after "leaves." Even in Whitman's

'Pioneers," a poem with which Mr. Linton must be thoroughly familiar, we have (p. 215):

"We the surface broad surveying *and* the virgin soil upheaving."

This "and" is in Osgood's revised edition "we." Another line of the same poem (p. 218) gives us "sleep" instead of "rest." If in these cases, or any of the others named, the editors have had access to private manuscripts or anything superseding the best editions accessible in print, they should have said so. The variations are so numerous, and in most cases so easily explained by careless transcribing, that it is not sufficient to expect us to rest upon the claims of the prospectus. A good poem is the world's jewel; anybody may alter the setting, but to recut the gem is a liberty which at least requires explanation.

Other points are open to criticism in the literary presentation of these poems. One will look in vain through Whitman's works for "The Soldier's Letter" given in this collection ('Lyrics,' p. 219); it appears in Osgood's edition of 'Leaves of Grass' (p. 236) under the title of "Come up from the Field, Father." Tannahill's beautiful poem, "O sair I rue the witless wish," is here given as "Love's Fear," and Clough's "Say not the struggle" is here called "Not unavailing." These changes are questionable liberties. The poet has a right to make his own title, and as it is, after all, the chief aim of every anthology to direct the reader to the original volumes, an alteration in the title is very confusing and leads the explorer to waste much time. It is no better, but rather worse, when only a part of the original production is given, with a new title and without explanation; thus, we have here what appears as a poem called "Waiting" (p. 301), attributed to Thomson. It is in reality a portion of a longer composition called "Sunday up the River," but no mention of the fact is made. In some cases, too, we note the absence of proper information as to the compound authorship of a poem; thus, it is not explained that the last two verses of Burns's "Of a' the airts" ('Chaucer to Burns,' p. 296) were not written by that poet, but by John Hamilton.

In the way of literary criticism, these volumes offer very little, and that little is chiefly contained in Mr. Stoddard's prefaces. The work of this gentleman is almost always well done, when—as in this case—he sets about it seriously and soberly, and keeps free from egotism and whims. We know not where to look for a more compact and useful introduction to English poetry than the two chapters which precede these two volumes. It is rash to question Mr. Stoddard's authority in matters of literary history, but we suspect him to be wrong in thinking that Allan Ramsay published the *Evergreen* first, and the *Tea-Table Miscellany* afterward; if we mistake not, the first volume of the *Miscellany* appeared in January, 1724, and the *Evergreen* in October of the same year. Nor can we find him quite correct in attributing the volume of poems by Lovell and Southey to the year 1794; the copy before us is dated 1795. True, the book is attributed by Southey's biographer to the close of the previous year, and it may possibly have appeared during the holidays, and have been post-dated, though we had not supposed that this bad practice began in England so early. Again, why speak of "Bürger's ballad 'Ellenore' which Scott Englished into 'Lenore'"? Does not the original ballad begin:

"Lenore fuhr um's Morgenroth
Empor aus schweren Träumen"?

Scott Englished the name into "Helen."

In the notes, at the end of the volumes, we find much valuable information, and often a very perplexing absence of it. In many cases, the titles and dates of the respective publications of authors are given with exhaustive care, and this not in poetry alone; we have thus the dates of all Mr. Aldrich's novels, and of Bayard Taylor's very numerous publications. In other cases, as with Matthew Arnold, there is no pretence at such a bibliography; and it is left to be understood, in such cases as those of Jean Ingelow, Celia Thaxter, and Helen Jackson, that they have written only poetry, although, in the case of Mrs. Stoddard, all the novels appear with their dates, and there is no volume of poetry at all. This is disappointing and uncertain, while the absence of alphabetical arrangement or index greatly diminishes the usefulness of this part of the work. We sometimes demur at the criticisms, as where it is said of Wolfe that, besides "The Burial of Sir John Moore," he "wrote only a few songs of little importance" ('Lyrics,' p. 315), whereas the fine poem beginning "If I had thought thou couldst have died" would have preserved his name, had nothing else done it; indeed, the closing lines of this poem are classic:

"Yet there was round thee such a dawn
Of light ne'er seen before,
As fancy never could have drawn,
And never can restore."

If we have seemed to criticise this new collection with a minuteness not always applied to similar work, this especial attention is due largely to the claims made by the publishers. Had they not said that "the work was directly suggested by the defects of the existing anthologies," we should not have demanded more of it than of the rest, and should have met with no disappointment. Had they not claimed for the book "an entirely exceptional position," it would not have been scrutinized with exceptional care. It is as good, probably, as the majority of such works, but it is our unwelcome duty to point out that it is no better.

BOOKS ABOUT THE STAGE.

Henry Irving, Actor and Manager. A Critical Study. By William Archer. London: Field & Tuer; New York: Scribner & Welford. 16mo, pp. 108.

Henry Irving. A Short Account of his Public Life. William S. Gottsberger. 12mo, pp. 212.

The Story of Helena Modjeska (Madame Chlapowska). By Mabel Collins. London: W. H. Allen & Co.; New York: Scribner & Welford. 8vo, pp. 297.

Helena Modjeska. By Jameson Torr Altemus. J. S. Ogilvie & Co. 8vo, pp. 217.

Some London Theatres, Past and Present. By Michael Williams. London: Sampson Low & Co.; New York: F. W. Christern. 8vo, pp. 215.

Au Bout de la Lorgnette. Par M. Paul Mahalin. Paris: Tresse; New York: F. W. Christern. 8vo, pp. 334.

It is well-nigh impossible to repress a feeling that there is something almost indecent in the writing of a man's biography while he is yet alive. That a man should write his autobiography and seek to set himself before his contemporaries as he appears to himself, is well enough, although there is a well-founded belief that the posthumous publication of an autobiography is best. But there is really little or nothing to be said in favor of a detailed biography of a living celebrity, save that it may gratify the impertinent curiosity of the idle, and turn an humble penny for the compiler of the book. The recent biographies of Mr. Gladstone and Sir Garnet Wolsely, in England, and of General Grant and Doctor Holmes, in the United States, are cases in point. They are emphatically works of supererogation. That the habit of preparing them is on the increase is a misfortune. For one thing, they are likely to err either in fulsome eulogy or in personal abuse. It may be taken for certain that the biography of a living celebrity is rarely written by a calm critic; almost always it is the work of a warm friend or of a bitter enemy. We believe we may safely say that the biographies of actors and of actresses printed while they are yet before the public are all either libels or puffs. The famous, or infamous, book against the elder Booth, 'The Actor,' is an instance of the libel, and the life of the younger Kean, written by a former member of the stage of his theatre, is an example of the puff.

Of the first four books on our list three are biographies of living celebrities. They are puffs, more or less disguised; and they vary but little in their worthlessness. The exception is Mr. Archer's study of Mr. Irving; this is not a biography but a criticism, and criticism is always in order. Mr. Archer's discussion of Mr. Irving's histrionic career is quite as legitimate as Mr. Hill's criticism of 'The Political Adventures of Lord Beaconsfield,' which was published during Disraeli's life. Those who seek for firm reasons for their admiration of Mr. Irving's performances will receive it gladly and read it with profit and pleasure. It has been roughly reviewed by some of Mr. Irving's indiscreet followers in England, but we question whether the actor himself would not greet the critic with more kindness and with more respect. Mr. Archer's criticism is searching and incisive, and its expression, although temperate, is frank. This is not the place nor is this the time to discuss again and at length the quality of Mr. Irving's histrionic gifts. It must suffice to say that he has an intelligence as alert as any on the modern stage, and that as an actor he does all that can be done by intelligence alone, cramped as it is by a want of thorough artistic training, and by an abuse of personal peculiarities which we cannot think other than wilful. He thus excels in "character" parts, while he does not excel in "heroic" parts, to use a distinction well taken by Mr. Archer (p. 51), who classes *Hamlet*, *Romeo*, *Macbeth*, and *Eugene Aram* as heroic parts, while setting off *Shylock* and *Richard III.*, with *Mathias*, *Richelieu*, and *Louis XI.*, as "character" parts.

The three other books devoted to Mr. Irving and Mme. Modjeska may be dismissed briefly. They are rubbish. The authors are ignorant not only of the principles of acting, but even of the more easily attainable history of the stage. They abound in blunders of fact. The anonymous life of Mr. Irving professes to follow his career step by step, but it makes many omissions, notably failing to record his acting with Mr. John T. Raymond in Paris in 1867 in support of Mr. Sothern's *Lord Dundreary*. It contains many misprints: "Blough," for "Brough," for instance, and "Matthews" for "Mathews." It refers to the "naturalism which was introduced into the humble walks of the drama—by Liston, the younger Mathews, the Bancrofts, and Toole"; and it classes together as great innovators in art Berlioz, Whistler, Emerson, Swinburne, and Mr. Irving—truly a happy family. Mr. Altemus's life of Mme. Modjeska begins with the assertion that she is a greater actress than Neilson, Ristori, or Rachael (*sic*). The most of its facts seem to have been borrowed from Miss Mabel Collins's biography. This last we may fairly accept as authorized by the subject, since it contains personal details likely to have been derived from the lady herself; and in mere style it is the best, although this is not saying much, as all three of the authors believe that a tragic actress ought to be called a *tragedienne*, and an actress of comedy a *comédienne*, and that an actress is not an artist but an *artiste*.

They also all believe in "spontaneity," or the reliance on the inspiration of the moment. Miss Collins remarks (p. 215) that Mme. Modjeska "is not a mechanical actress," and so her "business" in the "Dame aux Camélias" varies with every performance; and the anonymous biographer of Mr. Irving finds fault (p. 205) with Mr. Terriss, of the Lyceum company, because his "stage-business, once thoroughly mastered in rehearsal, has become part of the rôle to him forever after." To say this is to say that Mme. Modjeska does not know the rudiments of her profession while Mr. Terriss does; which is very indiscreet in a biographer. The writers who approve of the reliance on "spontaneity" are always prone to cast reflections on "tradition." Now, tradition on the stage is not in itself a bad thing. Like the common law, it contains the accumulated wisdom of the ages, and although it may frequently need reform, the innovator must show cause for the change—the burden of proof lies on him.

Mr. Williams's volume on 'Some London Theatres' contains five papers sketching the history of Sadler's Wells, the City of London, the Marylebone, Highbury Barn, and the Lyceum. They are laboriously compiled, and contain many items of interest—about Grimaldi, for example (p. 13), and John Howard Payne (pp. 12, 115), and J. W. Wallack (p. 101). It is with curiosity that we note the performance in London of Mrs. Mowatt's "Armand, or the Peer and the Peasant," the title of which is not now more old-fashioned than the play itself, and of Mr. Epes Sargent's tragedy "Velasco, or Castilian Honor" (pp. 96–97). Mr. Sargent's first name is misspelled "Eps," and Mr. Joaquin Miller's "Danites" is credited to Mr. Bronson Howard. The final chapter on the Lyceum, with its account of the performances there when Charles Fechter was manager, and again since Mr. Irving took possession, is useful. The book sadly needs an index.

M. Paul Mahalin is one of the lively young wits who give to Parisian journalism its most characteristic flavor. The *Figaro* is the typical sheet which these young men make, but the *Gil Blas* is simply the *Figaro* pushed a little further, and the *Gaulois* is simply the *Figaro* not so well done. M. Paul Mahalin's attachment is to the *Gaulois*, where he signs "Triolet," and where he writes a "Soirée Théâtrale," imitated in some measure from the always amusing articles of M. Arnold Mortier, the "Monsieur de l'Orchestre" of the *Figaro*. M. Mahalin is not as lively, witty, or well-bred as M. Mortier; but he will serve. In the present volume he has gathered together more than a hundred of his little personal articles, sometimes only a crackling squib of a triolet, and sometimes a string of entertaining anecdotes. The best thing in the book is a quotation from Theodore de Banville, describing the "making" of M. Coquelin.

THE *WANDERER* IN THE SOUTH SEAS.

The Voyage of the "Wanderer." From the Journals and Letters of C. and S. Lambert. Edited by Gerald Young. Illustrated by R. T. Pritchett and others. London and New York: Macmillan & Co. 1883.

It would be easy to imagine, without the testimony of those who have tried it, that a voyage around the world with pleasant companions, in a well-appointed yacht, must be, for those who find enjoyment at sea, an interesting and agreeable experience. The record of the *Wanderer's* cruise fully realizes, in many respects, one's ideal of such a journey, for it is the story of two very delightful years of travel, with the varied experiences of many ports and inland excursions, unusually free from mishaps to the pleasure-seekers, and, barring one or two accidents among the crew, and the occasional misery of sea-sickness among the passengers, a period of almost wholly uninterrupted enjoyment. The *Wanderer* sailed from Cowes on the 5th of August, 1880, having on board her owner, Mr. Lambert, with his wife, two daughters, two sons, the Rev. Mr. Wetherall, chaplain, Robert T. Pritchett, artist, Miss Power, governess, a ladies' maid, nurse, valet, and footman, making thirteen in all for the family party, besides a full ship's company of officers (among them a surgeon) and crew, numbering fifty more, or sixty-three persons all told. The narrative contains no detailed description of the vessel, but her equipment indicates a comfortable size, and her picture shows a three-masted craft, with fore-and-aft rig and square sails on the foremast, making a fair spread of canvas, aided by an auxiliary screw. While she does not appear to have earned distinction as a swift sailer, the *Wanderer* evidently possessed in a high degree the essential qualities for the purpose of her voyage—safety and comfort, with speed sufficient for people of leisure.

From the point of departure the *Wanderer's* general course lay westward around the globe, touching, however, first at Vigo Bay and Lisbon, and afterward at Madeira, Cape de Verde Islands, and Gaboon on the coast of Africa; thence by St. Helena to the east coast of South America; thence passing through the Straits of Magellan and calling at Valparaiso, Juan Fernandez, and Coquimbo; thence to the Marquesas, Society, Fiji, and Hawaiian Islands; thence to Japan, China, Singapore, Ceylon; through the Red Sea and Suez Canal to the Mediterranean, skirting the coast of Palestine and Asia Minor to Constantinople; thence to Greece, Sicily, Italy, Sardinia, Algiers, Malaga, Gibraltar, and Lisbon, thence to Queenstown, and, finally, home again to Cowes. The narrative of this long journey makes a large octavo volume of 335 pages. Edited by Mr. Young, it is mainly composed from the letters and journals of Mr. and Mrs. Lambert and Mr. Wetherall, and retains in its printed form a good deal of the ease and freedom of style appropriate to friendly correspondence. Its most entertaining portion is, perhaps, that which refers to the less familiar parts of the earth's surface, on the Pacific side of the globe; and more especially the South Sea Islands, among which the ship made a somewhat extended cruise, calling at some very queer places, not often visited by English families. Indeed, the voyagers all agreed, upon leaving the Marquesas, that nothing in their cruise had interested them so much. Nor is it difficult to imagine that the spectacle of a well-dressed and well-bred English family, comprising papa, mamma, boys, girls, the parson, artist, and governess, moving about among a crowd of nearly naked and highly inquisitive islanders, and, last of all, "an English man servant, trying to keep up a respectable dignity, with a Marquesan beauty on each side of him holding his hands, their little brown fingers interlaced with his, while they gurgled and cooed in his face," must have been a rare and curious sight to all observers.

The coral-islander is an interesting creature on account of his extreme simplicity. As the inhabitant of a typical coral island or atoll, far remote from other land, he represents the simplest form of humanity. He has fewer wants, fewer natural resources, and fewer ties of relationship to the rest of the world than any other human being. He has no necessities that cannot be supplied from a single source, the cocoanut tree, which gives him his food, drink, and shelter, his scanty dress, canoe, sails, nets, and cordage, implements and utensils of various sorts, and oil. His native land is a narrow strip of coral sand swept together by the waves upon a coral reef, all consisting of a single mineral, the carbonate of lime. He knows no ground higher than the beach. He has no conception of a mountain or river, and sometimes lives entirely without fresh water. His cocoanut diet is varied only by the fish or birds which are within his reach, and which fix the limit of his acquaintance with the animal kingdom, except where that has been enlarged by shipwrecked rats or a few pigs and fowls landed from some passing vessel. He can make fire by friction, but has little use for it. He has no tillable land and no agriculture, and little other occupation than fishing, bathing, and gathering cocoanuts. He has but little knowledge of any other people than the two or three hundred of his own kind with whom he has grown up. A language of a few hundred words has sufficient capacity for his needs of expression. He has no neighbors, no foreign intercourse, no trade or traffic, no arts of war. He is surrounded by sea and sky, and, excepting the occasional ships which, like comets, have come and gone, he knows nothing beyond his own horizon.

When the South Sea Islander's lot is cast upon one of an extensive group, and especially upon one of the larger and higher islands of volcanic origin, he is a man of somewhat greater resources and more varied experience. Intercourse with foreigners has given him some education; and he has adopted more or less of the habits, manners, and morals of the superior race with whose companionship he has been favored. If, under these conditions, he is not more interesting than the simple coral islander of the remote atoll, he is certainly more amusing with his grotesque mingling of native simplicity and foreign fashion. It was generally under these circumstances that the voyagers of the *Wanderer* made the acquaintance of the islanders, and found them most entertaining. Their first experience was at one of the Marquesas, under French "protection," where, upon landing, they

"were immediately surrounded by a crowd of laughing, chattering natives, few of whom could speak English, fewer still French. Most of the men were naked, some sported a loose fluttering shirt, but, to make up for deficiency of clothing, they were most beautifully tattooed from head to foot. The women and elder girls wore long bright colored cotton dresses, but no other garment. . . . Squatting near us was a fat old woman with yellow hair that stuck out horizontally like the branches of a cedar tree. She had fallen in with the new custom of putting on a nightgown, but she evidently thought it a foolish business, and the sleeves seemed to annoy her particularly, for whenever she wanted to use her hands or arms, she slipped them out at the bottom of her gown, raising the whole garment in folds to the necessary height to enable her to do what she wanted. . . . Beatrice's long plait of hair attracted a great deal of attention from the native ladies, who followed her about, lifting it up and letting it fall on her back, and she kept very close to Bob, not at all fancying these familiarities."

At Borabora they went ashore to pay their respects to the child queen,

"a bright, sprightly little creature of nine and a half years old, who received us very graciously, evidently taking a great fancy to Beatrice, whom she invited to stay and spend the afternoon, but as it was rather late we promised she should come back the next day. Moe, the little queen's mother, was also present, as well as her uncle, who acts as prime minister, and practically governs the island in his niece's name. Moe is a very pleasant person, and speaks English well. . . . At ten o'clock (next day) we sent for the queen and she came in state with her mother, another lady and six chiefs. The queen was dressed in yellow silk, gold necklace, a hat with a pink ribbon, and wore high-heeled French shoes, which evidently inconvenienced her very much—not to mention her garters, an evident source of worry; at one time

during her visit the prime minister was seen trying to arrange them more comfortably for her. Moe was dressed in black silk, and the third lady in pale yellow grenadine, with white embroidered petticoats. The queen fidgeted about all over the ship, and, taking Beatrice by the hand, made her show her everything. She was delighted with the piano, kicking her feet about in time as it was played. Before leaving she asked the girls to go and see her in the afternoon, which they promised to do, so after lunch Beatrice and Miss Power went off to return the visit. They found she had taken off her grand dress and put on a loose native one, and, later on, when we called for Beatrice in the galley, we saw the queen, having got rid of her visitors, racing about with bare feet in comfort. The next day was a Sunday, and from the deck we saw the people flocking into chapel at 7 A. M., and again at ten; for Sunday is kept here very strictly, and the people are very orderly and quiet. At 8 P. M. every night a bell is rung, and at nine it rings again, after which hour no one is allowed to be out. It was a damp muggy morning, but cleared sufficiently for us to have service, to which the queen, attended by her ministers and six chiefs, came; also, Mr. Blackett. The chiefs all looked remarkably uncomfortable, three of them in high black hats, one in an old opera hat, another in a pith helmet. Their clothes, too, were of every cut and material and of the seediest description—but they will serve for years yet, as no doubt they are only worn on grand occasions."

Mr. Lambert has no word of praise for French "protection" in the Marquesas and Society Islands, to which he attributes, probably with justice, the "disease, drunkenness, and immorality" prevailing there; and he earnestly prays that Borabora, which is still independent, and which is, at present, "a happy little kingdom, with a people leading a sober, righteous, and godly life," may be "spared from French protection, civilization, and misrule."

In the Fiji Islands the voyagers found much o interest them in the natural resources of the country, which are being gradually developed under English influence, especially the sugar culture, and also in contrasting the government and system in English hands with that of some of the French-ruled islands they had visited shortly before. It is but five years ago, says the narrative, since this country was cannibal, and it appears from what follows that the native epicures still cherish very savory memories of joys that they have tasted in the happy past. One of these informed the party that the human "fat is yellow, and smells like roast duck, and that the prime parts are the arms and thighs." It has been stated, on the authority of other leading cannibals, that the palm of the hand is unsurpassed for juicy tenderness and delicate flavor; but doubtless even cannibals have their preferences. Another old chief, who was introduced as one who had clubbed and eaten many men in his day, on being asked if that were so, "answered, smacking his lips and rubbing his old stomach, 'Yes, many, in old time; very good.' This dreadful old man gave us a curious little wooden dish, something like a flat, shallow sauce boat, in which many good bits of humanity had been placed, nicely roasted." The old white-haired and nearly blind ex-king Thakombau, "a fine old man, very upright and not wanting in a certain dignity of gait and manner," is said to have eaten "hundreds of human beings, and the only favor he now asks of the Governor is to be allowed to eat one more man before he dies."

The visit to Hawaii had another object than curiosity and pleasure-seeking. It was to place a memorial stone upon the grave of a son, Charles Lambert, who, at the age of twenty-four was drowned while bathing at Kailua Bay in 1874, and who lies buried in the churchyard at Kona not far from the spot, memorable in the history of the islands, where Captain Cook met his death.

The book is a very handsome one, abundantly illustrated, containing, besides many woodcuts, twenty-three colored plates—with one exception, by Mr. Pritchett. These, though perhaps slightly extravagant in color, have a generally pleasing effect, somewhat marred, here and there, for the critical eye, by the blemish of a misspelled word in the title, as "Attol" for Atoll, "Kilaua" for Kilauea (the crater). The text itself, though generally free from typographical errors, shows some inaccuracies in the rendering of proper names, such as "Kilaua" for Kailua (one of the bays of Hawaii), and others due to inattentive proof-reading, as "Panmotu" and "Paumutu" for Paumotu, "Savau" for Savaii. The book, though offered to the public, is doubtless more particularly intended for the relatives and friends of the voyagers, to whom it will be a pleasant souvenir of a happy and memorable cruise

NOW PUBLISHING

THE ENGLISH ILLUSTRATED MAGAZINE.

Single Number, Price 15 cents; Yearly Subscription, $1.50. Sent Free by Mail.

The price at which the ENGLISH ILLUSTRATED MAGAZINE is issued justifies the belief that it will appeal to a large and varied circle of readers, and an endeavor will be made, in the choice and arrangement of its contents, to satisfy the tastes of all who are interested in literature and art.

The ENGLISH ILLUSTRATED MAGAZINE is designed for the entertainment of the home, and for the instruction and amusement of young and old, and it will be conducted in the belief that every section of its readers, in whatever direction their tastes and interests may tend, are prepared to demand and to appreciate the best that can be offered to them.

The following, among others, are contributors to the current volume:

WRITERS.

GRANT ALLEN.
BERNARD H. BECKER.
WILLIAM BLACK.
J. COMYNS CARR.
AUSTIN DOBSON.
ARCHIBALD GEIKIE, F. R. S.
A. J. HIPKINS.
CHARLOTTE M. YONGE.
F. W. MAITLAND.
FREDERICK POLLOCK.
J. H. SHORTHOUSE.
R. L. STEVENSON.
A. C. SWINBURNE.
The Author of "John Halifax, Gentleman."
PROF. HUXLEY, P. R. S.
RICHARD JEFFERIES.

II. IN THE FENS. With Illustrations by R. W. MACBETH, A. R. A.
III. THE BANQUETING HOUSE AND OLD WHITEHALL. By AUSTIN DOBSON. With Illustrations.
IV. BRASS WORK AT BIRMINGHAM. By BERNARD H. BECKER. With Illustrations by A. MORROW.
V. THE LITTLE SCHOOLMASTER MARK. A Spiritual Romance. By J. H. SHORTHOUSE (author of 'John Inglesant').
VI. OYSTERS AND THE OYSTER QUESTION. (Concluded.) By T. H. HUXLEY, P. R. S. With Illustrations.
VII. THE ARMORER'S PRENTICES. Chapters III.-V. By CHARLOTTE M. YONGE.
ORNAMENTS, INITIAL LETTERS, ETC.

"If it continues as it has begun will supply a quantity and quality of superior literary and artistic substance, at a price—fifteen cents a copy—which should give it the widest and most immediate popularity. As for ourselves, we shall look for it each month as eagerly, almost, as for its more elaborate and ambitious American rivals, with which, all things considered, it compares, in some respects, even more than favorably."—*Christian Union.*

"A welcome contribution to periodical literature. The price is wonderfully low, and should the excellent standard of the first number be maintained, there can be no doubt that it will be immensely popular."—*Boston Traveller.*

"Will be heartily welcomed, and it comes with abundant auguries of success. It is cheap in price—fifteen cents a number—but it is not cheap in quality."—*Churchman.*

"The magazine is a marvel of cheapness, and it will from the start appeal to every Englishman in the country, and no less to the immense American magazine reading public. . . . . A welcome addition to the ranks of first class periodicals, and if it did not find a want ready for it, it will not be long in making one."—*Boston Courier.*

"So decidedly good that we think its success is assured."—*Albany Argus.*

"It will be a welcome visitor to a large class of cultivated people, who desire to possess the best things in English literature and art."—*Indianapolis Times.*

WRITINGS OF MATTHEW ARNOLD.

PROSE WORKS.

Cabinet Edition. In Seven Volumes. 12mo, each, $1.50.
(Uniform with the Eversley Edition of Charles Kingsley's Novels.)

CONTENTS OF THE VOLUMES.

Vol. 1. Essays in Criticism.
Vol. 2. On the Study of Celtic Literature—On Translating Homer.
Vol. 3. Culture and Anarchy—Friendship's Garland.
Vol. 4. Mixed Essays—Irish Essays.
Vol. 5. Literature and Dogma.
Vol. 6. God and the Bible.
Vol. 7. St. Paul and Protestantism—Last Essays on Church and Religion.

The Set of Seven Volumes, in paper box, $10.50.

PASSAGES FROM THE PROSE WRITINGS.

12mo, $1.50.

"Mr. Arnold's writings so abound in impressive and suggestive passages, which bear separation from the text in which they appear, and are worthy of frequently re-reading, that his works may be said to lend themselves in a peculiar and unusual degree to this sort of anthological treatment."—*Evening Post.*

POEMS.

Cabinet Edition. In Two Volumes. 12mo, $3.50.

Vol. 1. Early Poems, Narrative Poems, and Sonnets.
Vol. 2. Lyric, Dramatic, and Elegiac Poems.

The Poems and Prose Works, Cabinet Edition, Nine Vols. in paper box, $14.

American Edition of the Poems, Complete in One Vol., 12mo, $2.

"It is to him and Clough that the men of the future will come, who desire to find the clearest poetic expression of the sentiment and reflection of the most cultivated and thoughtful men of our generation."—*The Nation.*

"Yet I know numbers of young men—and some, alas, no longer young—who have found in Matthew Arnold's poetry a more exact answer to their intellectual and emotional wants than in any poetry of Tennyson's, or even of Emerson's."—*Henry A. Beers, in the Century Magazine.*

"Contains some of the wisest and most melodious verse that this age has produced."—*London Athenæum.*

SELECTED POEMS.

Golden Treasury Series. 18mo, $1.25.

"A volume which is a thing of beauty in itself."—*Pall Mall Gazette.*

The Nation.

NEW YORK, THURSDAY, DECEMBER 6, 1883.

The Week.

In his report of last year, the Comptroller of the Currency said that it would be better to abandon the national-banking system altogether than to attempt to carry it along without bond-security for the circulating notes. This view he supported by strong but not wholly conclusive arguments, the most weighty being his belief that the existing system had so entirely won the confidence of the people, through the absolute security of the notes, that the door to endless fraud and swindling would be thrown open if the bond security were withdrawn. He did not believe that the banks would ever agree to guarantee each other's notes, and he could not imagine any other effective insurance fund to take the place of the existing security of Government bonds. He failed, however, to point out what would come after the bond security should have disappeared through the extinction of the national debt, and he fails to do so now, although he hints that the thing most likely to happen will be the revival of the old State-bank system through the repeal of the 10 per cent. tax on their circulation. In his present report he says: "Other propositions have been suggested in order to postpone or prevent the contraction of national-bank circulation, but the Comptroller considers that, so long as there is a sufficient amount of United States bonds outstanding, legislation should be so shaped as to continue them in use as a basis for national-bank circulation."

With this postulate everybody except the Greenbackers pure and simple will agree. The legislation which he suggests is to repeal the 1 per cent. tax on national-bank circulation, and to allow the issue of notes to the extent of 90 per cent. of the market value of the bonds deposited, instead of 90 per cent. of their par value. These measures, he says, would suffice to maintain the circulation at its present aggregate, by enabling the banks to buy the 4 per cent. bonds at the present high premium, or even a higher one, to take the place of the 3s, which are now in course of extinction. How long a time the circulation could be maintained would depend upon the policy to be adopted by the Government with reference to the 4 and 4½ per cent. bonds, after the 3s are all called in. Some people assume that when the 3 per cents are all paid, the Government must fold its hands and wait till the year 1891, when the 4½ per cents mature. This idea garnishes Mr. Blaine's project for turning over the proceeds of the whiskey tax to the several States. Mr. Knox does not overlook the likelihood that the Government will have surplus revenues after the 3 per cent. bonds are paid off, and that it will make use of them by advertising for bids for the sale of bonds to the Treasury, as was done by Secretaries Boutwell and Bristow when there were no bonds upon which the option had matured Therefore Mr. Knox hazards no opinion as to the length of time that the national-bank circulation might be maintained if the curative measures which he recommends were adopted. He barely suggests that the time for paying the principal of the public debt might be postponed, but he evidently does not have sufficient confidence in the plan to embody it in a formal recommendation.

The report of the Postmaster-General on the postal service contains several recommendations, the most important of which are that the unit of letter postage should be made one ounce instead of a half-ounce, and that the rate on transient newspapers and periodicals should be one cent for every three ounces, instead of one cent for every two ounces as at present. The reasons in favor of these changes which Mr. Gresham gives are simple and strong. He argues that the raising of the unit for letter postage will not make much difference in the receipts, since the greater part of all letters mailed weigh less than half an ounce each. Less than six per cent. of them weigh more than that, and require double postage. With the rate fixed at two cents an ounce both the public and the post-office would be saved a vast amount of trouble. The same thing would be true of the change in the newspaper rate. Mr. Gresham says truly that the current impression is that one cent per copy is the uniform rate for newspapers, although many weigh more than that; and that persons who deposit those weighing more with only a cent postage stamp attached, complain because they are not forwarded. The reduced rate would bring all newspapers within the one-cent limit and remove all chance for misunderstanding. With these minor reductions the Postmaster-General thinks the Department should rest for the present. He estimates that the deficiency in the Department for the coming fiscal year will be nearly $3,000,000, owing mainly to the reduction in letter postage. For this and other reasons he opposes the establishment of the one-cent rate for drop letters in cities. On the question of a postal telegraph, he maintains the authority of Congress to assume control of the business, but does not think the evils complained of in the present management are sufficiently grievous to call for Congressional legislation.

The comments of the press of the country upon Mr. Blaine's whiskey-tax scheme show unmistakably that he has overshot his mark, as usual. Instead of impressing the country with his statesmanship, he has merely strengthened the prevalent suspicion of his sensational unsoundness upon all public questions. The public recognize in this tax-distribution scheme the same dangerous "brilliancy" which was shown in the South American diplomatic manœuvres, and they do not like it any better now than they did then. The principal "slogan" of the letter, "Is it wiser to tax whiskey than to tax farms and homesteads and shops?" is, we are happy to notice, taken for precisely what it is—a piece of clap-trap pure and simple. When the Wharton Barker plan was first broached, its advocates made little concealment of their belief that it would become popular chiefly because the ignorant masses would look upon it as an escape from taxation. In other words, it was based on the supposition that the people are mostly fools. Mr. Blaine's plan was merely a modification of Mr. Barker's, and was conceived in the same spirit. It is a most encouraging fact that both plans have met with instant condemnation and failure.

A prospectus for an International Bi-Metallic Monetary Association has been issued. The call is signed by General Grant, Mayor Edson, and thirty-eight other gentlemen, most of whom will be recognized as eminent in their respective vocations and in society. None of them, however, have acquired any reputation as economists or made any pretensions to distinction in that way. The principal object of the association is to establish the free coinage of silver on the same terms as gold, by international arrangements, and to co-operate with associations abroad having the same object in view. This is the proper course to be pursued by those who think that bi-metallism is practicable and useful. Bi-metallism by one country is an acknowledged absurdity, and has been condemned by all the bi-metallist authorities in Europe and America. "Birds of a feather flock together," said Lord Dundreary, "for how could one bird flock all alone by himself?" The mistaken attempt of the United States to "flock all alone by itself," furnishes a good starting point for the labors of the International Bi-Metallic Monetary Association. The first step to be taken to secure their end is to stop our coinage of two millions per month, so that the pressure of this amount of silver may fall upon foreign countries as well as upon ourselves. Of course England and Germany will do nothing so long as we voluntarily assume the burden of carrying all the surplus silver produced in the world. We trust that General Grant, Mayor Edson, and their associates will look sharply into this matter, and read carefully the writings of Cernuschi, Horton, Walker, and other bi-metallists, at home and abroad, who have borne valuable testimony upon this point.

Ohio politics are full of surprises this year. It has been generally believed that Senator Pendleton had small chance for reëlection, but the latest advices from the State are to the effect that the combinations against him have fallen through, and that he has more strength than any other candidate. It was thought that his solitary position as the only active civil-service reformer in his party had retired him permanently from politics, but the hostility toward him on that question seems to have been much more bitter among the Democratic politicians and newspapers than among the

people. His return to the Senate in January would give his party, what it has not now, something to "point to," as evidence of a friendliness toward civil-service reform. The claim could then be made that the author of the present Civil-Service Reform Law had been "endorsed" by his party.

The literature of the "Mormon problem" has been enriched by several new contributions during the past few days. The Rev. Dr. Armitage has produced the suggestion that polygamy is probably a species of "constru ctiveslavery," and therefore obnoxious to the Thirteenth Amendment. General Rosecrans, who is a member of Congress, takes a different view, and has prepared and published a constitutional amendment prohibiting polygamy throughout the United States, and giving Congress power to deal with it, which he will introduce into Congress at the earliest possible moment. There seems no reason why this should not be adopted at once, as polygamy is already an indictable offence, punishable by fine and imprisonment (U. S. R. S., sec. 5,352). The General's idea must be that a Mormon who would not shrink from polygamy as a crime, would quake with horror at the idea of having unconstitutional wives, and at once abandon the practice. It looks as if all discussions of the Mormon problem ought to be prohibited by law, unless accompanied by a careful statement under oath of what those who undertake to solve it believe the problem to be. "Troops" might be used against any man or body of men found thinking in violation of this rule.

The "National League for the Suppression of Polygamy," organized in October last, promises, it is said, to become large and powerful. It is described as a secret, oath-bound society, the members being pledged not to disclose its proceedings, nor to make public the names of the members. The only reason that we can imagine why anti-polygamists should get up secret organizations is because they know that their arguments or proposals are likely to be such as will not bear examination. The day for a crusade against the Mormons seems to be over, for a conflict between them and the Gentiles could only result in Utah being held temporarily by troops, who would restore order; but, after order is restored, all the wives will come out from the closets and from under the beds again, and polygamy will go on just as before. In fact, with troops in the Territory, the Mormons would probably be safer than they are now.

The divorce problem was discussed by the Congregational Club on Monday night, and the Rev. Mr. Dike, who has devoted a great deal of time and attention to it, delivered an address. He recommended changes in the State divorce laws, all of which would no doubt do good, but none of which would insure a permanently uniform systemall over the country. It is this fact which makes the discussion of the problem look sometimes as if it was carried on for its own sake, or as if it were thought that a solution of it might come to some one in the course of the discussion by inspiration. The Rev. Dr. Ingersoll, who is feeling about for a solution of this kind, suggested that "the craze for divorce ran in channels, like malarial fever, and, like that disease, it would die out in time."

Mr. Arnold's lecture on Emerson appears to have been a great success, and is itself the most complete refutation that could have appeared of the silly story that it was some "old" thing which he had brought over to "unload" on the American literary market. It is, in fact, a beautiful and delicate piece of criticism, such as no other Englishman or American, save perhaps Lowell, could have produced, in the course of which he succeeded in doing what few critics attempt and still fewer achieve—we mean, in giving a just estimate of his subject's place in philosophy and literature (necessarily a lower one than that which most of his admirers would insist upon) to an audience made up in large part of these admirers, and yet so as to please and delight everybody who heard him. His comparison of Emerson to Marcus Aurelius, as not so much a philosophy-maker as "the friend and aider of those who would live in the spirit," was a singularly happy critical suggestion.

The success of Mr. Cable's readings has drawn attention to the old question of a Southern literature and the literary differences between the new and the old South. Before the war the attempts of the South to produce a literature were failures, though it had apparently a good many qualifications for the task—a very peculiar civilization and institutions, a population ardently patriotic, and an educated class possessed of considerable refinement and leisure. It was badly handicapped by the fact that it could not tolerate any accurate description of itself, and a love of this sort of description is essential to any genuine modern literary growth. The thing that Southerners were most thoroughly agreed upon was that the South should not be seen as it actually was, and this led them to develop tastes in literature the exact opposite of those of the world around them. While Europe and the North were becoming more and more realistic, they fondly clung to romance. As Mark Twain somewhere puts it, they were led into secession and their consequent ruin by their blind affection for Sir Walter Scott. Southern novelists at least got from Scott notions of chivalry and romance which they misapplied as fatally as Southern politicians did their ideas of patriarchal institutions. The war swept all this away, and, as might have been expected, one of its most natural and interesting results is the appearance of new writers, who, like Mr. Cable and Mr. Harris, have completely broken with Scott and the middle ages, and are trying to make known to the world the real South.

The discussion over the rules of foot-ball at Harvard will probably result in the adoption of more stringent regulations than ever, and the fact seems to be that the game as now played is so violent, at best, that nothing but rigid supervision will prevent serious injury or loss of life. The distinction between legitimate play and "throttling," etc., though perfectly plain on paper and before the game begins, is sure to be lost sight of in the excitement of a rough-and-tumble struggle over the ball. The class foot-ball games at Harvard twenty-five years ago were simple fights, in which nearly everything short of gouging was legitimate, and they were in consequence peremptorily forbidden by the Faculty, and the game of foot-ball was practically banished there till the period of the great athletic revival after the war again brought it into fashion. The Harvard-Yale match, on Thanksgiving-day, which seems to have furnished a good day's sport, was regulated in advance by the Faculty. The old idea of the American professor that the athletic sports of undergraduates were something beneath his dignity, and with which he had nothing to do, is fast dying out, and the wholesome feeling of a common interest in the matter taking its place.

The suggestion that American girls of note should place their photographs on sale is one which certainly deserves consideration. The arguments in favor of it are, first, that it would add to their incomes and thus enable them to dress more extravagantly; second, that some of the English professional beauties are said to derive a revenue from this source; and third, that there is no question that actresses and prima-donnas do it. Against it, it is urged that hawking your face about the streets is not a nice thing for refined girls to do. This objection will only have weight, however, in refined families, and, as we have frequently pointed out in these columns, the great advance made by society in our time has been in the steps taken to recognize the claims of the vulgar. The refined have had the making and interpretation of the social code in their own hands for a long time; but the turn of the other side has come at last.

The white citizens of Copiah County, Mississippi, who were recently obliged to kill "Prent" Matthews, their sheriff, for voting, or attempting to vote, have held a mass meeting, and passed resolutions on the subject, but they seem to take it for granted that it was generally understood outside of Copiah County that "Prent" would have to be destroyed if he came to the polls; for the resolutions, instead of mentioning the facts which made the taking of his life necessary, mainly consist of a warning to his family that, if they do not "keep out of politics in Copiah County," they will be killed too. A committee was appointed, as is the custom in the case of obituary resolutions, to present a copy of the warning to the brothers and sons of the murdered man, and the Vicksburg *Herald* declares that the murder of Matthews is "not an event calculated to excite any regret outside of his immediate family circle." The main reason given by the *Herald* for the murder is that Matthews "kept Copiah County in a muss," or, in other words, made himself disagreeable to his neighbors. "The shedding of human blood is always to

be deplored," is the sentiment, it is hardly necessary to add, with which the *Herald* introduces its account. This sentence is, we believe, kept standing in every well-regulated Southern newspaper office.

A vindication of Governor Begole of Michigan has appeared. He was accused of having solicited passes for himself and Mrs. Begole from a railroad company, while recommending the company not to let the members of the Legislature have any. His friends now say this is a slander or "a deliberate lie," started by what they call the "Detroit Smut Mill," commonly known as the *Post and Tribune*. They say that the pass he asked for was due to him by the railroad company under an agreement with his firm for the transportation of freight, and that Mrs. Begole's was part of the same transaction, and was to be charged for in his current account with the company, and that he never used his ticket book for public business.

O'Donnell's conviction is a most satisfactory close to the horrible Phœnix Park tragedy. Five persons have been executed for it, and the informer whose testimony brought them to justice, and who was undoubtedly the worst of the lot, and whose escape from the gallows was a disappointment to all civilized men, has been murdered in cold blood. His murderer has now been convicted and will be hanged in the course of the present month, so that the full measure of justice will then have been meted out to all concerned. One deplorable result, however, will remain. The whole affair has brought discredit on the Irish people, which we fear will not be effaced for many a day, not so much because of the original murders—for conspirators as ferocious and senseless as the Phœnix Park ruffians could be found in any country—but because of the sympathy with which they have met from Irishmen all over the world. It is this, of all things connected with the crime, which has disgusted the civilized world, and in its eyes lowered the Irish people in the scale of civilization. We doubt if there ever was a good cause which met so little of the sympathy of humane and enlightened men everywhere to-day as the Irish cause, and this, almost wholly, because of the brutal and anti-social doctrines preached by so many of its advocates, and the base character of the instruments they are willing to use. No readiness to shed blood profusely in any cause degrades people in the eyes of mankind, as long as it is shed in open fight; but those who make heroes and martyrs of skulking assassins, cannot escape the scorn or detestation of the best portion of the human race.

In this country $47,000 were raised for O'Donnell's defence, but it must all have gone in counsel fees, for he called only one witness, and the despatch of General Pryor was probably the most expensive item in the account. What good General Pryor did beyond making whispered suggestions in court, does not clearly appear. He now says that he did not apply to be heard and have his application formally refused, because he was advised by counsel that it would prejudice the prisoner in the eyes of the jury if an American, employed by Irish-Americans to come over here and defend him, made any appearance in the case at all. To find this out, however, it was hardly necessary to go to England in person and take the opinion of counsel. It might easily have been discovered by writing to England, and getting an answer, at the small expense of ten cents, by any one who did not possess the elementary knowledge of the practice of English courts, and of the organization of the English bar, which any American lawyer ought to possess. The truth is, however, that the subscribers to the fund really sent him over, not so much to defend the prisoner as to do the very thing which he now excuses himself for not doing; that is, getting up and making a row in the court-room. The probabilities are that the value of his services would have been greatly enhanced, in their eyes, if he had sworn at the Judge, and had himself dragged out, neck and heels, by the police.

The quiet and almost unobserved retirement of Sir H. B. W. Brand from the Speakership of the House of Commons, compared with the excitement attending a corresponding change in the Speakership at Washington, furnishes a striking illustration of the difference in the position of the Speaker in the two countries. In England the office has now been for a long time a judicial one, almost as judicial as any judgeship in the courts of law. The Speaker appoints no committees, and, in fact, has no opportunity of favoring either one party or the other, except in allowing or not allowing his eye to be "caught" by would-be orators. Even as to this, however, he is furnished with a principle of selection by the custom of the House, which puts the leading men of both parties in seats near the Chair. The leading requisites of a Speaker are, therefore, easily agreed on both by Liberals and Conservatives. He is seldom, if ever, a great statesman or politician: neither party can spare such a man from the floor of the House. But he must be what Mr. Gladstone calls "a great gentleman"—that is, a man of independent fortune, and of high character and social position—and be gifted with tact, ease, polished manners, and readiness both of mind and speech. A man who has these, whatever his political antecedents, is sure of permanence in the place. Sir Henry Brand was for many years the Liberal "whip," that is, the gentleman who performs the onerous and unpaid duty of keeping the supporters of the ministry in good humor, by watching their whims and weak points, and seeing that they are present at divisions on important occasions. Nevertheless he was elected Speaker without opposition in 1872, and again when the Conservatives came into power two years later.

In the November *Fortnightly*, Mr. Charles Waring examines the Suez Canal question in an ably written article, and reaches the conclusion that England ought to buy the canal and enlarge or duplicate it, and then throw it open to the free navigation of the world. Such a consummation would undoubtedly solve all doubts and disputes which now disturb the ship-owners and the Canal Company, and would furnish an example of munificence and magnanimity of the most refreshing character. Mr. Waring believes that M. de Lesseps would sell out at some price, and that British commerce would gain all that the British Government would lose by the operation, and much more. He adds that the Government and British shareholders together own more than one-half of the property now, and that the acquisition of the remainder would not entail an excessive charge on the Treasury. The whole number of shares in the company is 400,000, of which the English Government owns 172,000. The latest quotation of the stock on the Paris Bourse was 2,175 francs per share. At this price, the cost of the 228,000 shares not owned by the Government would be about £20,000,000 sterling. Counting the Government shares at the same price (although they do not participate in dividends till the year 1894), the proposed donation to the world would amount to £32,000,000, not to mention the cost of the new canal, estimated at £8,000,000 more. Four-fifths of the resulting gain would be reaped by British merchants and ship-owners, and one-fifth by those of the Continent. The charges for transit should be sufficient merely to keep the canal in repair and pay the cost of administration.

M. de Lesseps's conferences with the ship-owners and commercial bodies of London, Liverpool, and Manchester have apparently not brought about an agreement of views. It appears, also, that there has been a hitch in the councils of the Khedive on the subject of the new canal, and that difficulties have arisen in the money market as a consequence of the political embarrassment in Egypt. In short, M. de Lesseps is in the situation of a private individual having to deal with three governments, yet having none of the attributes and powers of a government to enforce his own views. His claims rest upon moral grounds altogether, and here unquestionably he finds his only effectual support in the British Government. If this support were withdrawn the Egyptian authorities would sell a concession for a new canal over his head in a twinkling, and pocket the proceeds with a grin. France might protest, but she would never go to war to prevent the opening of a new canal. In such a situation, M. de Lesseps will probably find reasons for lowering his demands. The point in dispute between himself and the British ship-owners has been narrowed substantially to the question of dividends on the canal shares. The ship-owners are willing to concede 20 per cent. per annum—all receipts in excess of this amount to be applied to the reduction of tolls. M. de Lesseps contends for a division of the excess between the shareholders and the shippers, but will surely yield in the end, seeing that a new canal must be had, either with his consent or in spite of his opposition. Under a less conscientious government than that of Mr. Gladstone, his claims would have been brushed aside the day after Tel-el-Kebir, and a new canal would now be in course of construction under the protection of British guns.

MR. CARLISLE'S ELECTION.

THE election of Mr. Carlisle as Speaker of the House of Representatives is the outward sign of a reaction against the existing tariff which has been gathering force for some years, and of which the Tariff Commission of last year was itself a symptom. The Commission was an acknowledgment by the Republican party that the protective policy had been pushed to unjustifiable and unbearable limits. It was composed, in its *personnel*, of chiefs of the protectionist school and representatives of the principal protected trades. Their report began with an admission that the time had come for a relaxation of the severe restrictions put upon foreign trade, but when they came to details they failed to justify their own conclusions. The reduction of duties which they proposed was too faint to do more than set the country thinking, while in some directions they recommended an increase of duties which caused genuine alarm and roused stubborn and effectual resistance. Regarded as an educational measure, the Tariff Commission was extremely useful. Mr. Carlisle's success must be in part attributed to it, but both the Commission and the Speakership contest are the result and outgrowth of a public conviction that we have had too much tariff, and that the present bad state of trade is largely the consequence of it. The recent great meeting at Cooper Institute in favor of revenue reform is another sign of the strength of this movement. Five years or even three years ago it would have been impossible to bring together one-half the number of people who attended this meeting, and gave their assent to the principles which it was called to promote.

We do not look for any immediate radical changes to follow Mr. Carlisle's elevation to the Speaker's chair. His election signifies the direction in which the thought of the country has turned in respect of its tariff policy, rather than any determination or desire to knock away at once the crutches upon which so many of our crippled industries are hobbling. No revenue reformer, if a *carte blanche* had been given him to write a tariff upon, two years ago, would have proposed a scale of duties which would compel the steel-rail manufacturers to sell at $35 per ton, as they are now doing. Still less would he have proposed a policy which looked to shutting up three-fifths of the iron furnaces of the country. These interesting results, which have been brought about under the reign of the protectionists, prove that the tariff has done its best or its worst for us, and that nothing which the revenue reformers ever threatened can be so harmful as the condition we have actually reached after twenty years of extravagantly high duties.

The Philadelphia newspapers take a view of Mr. Carlisle's election which people in other cities and States can scarcely comprehend. They assume that the country is so enamored of a scale of duties averaging 47 per cent., that the mere suggestion of a change, however small and however adjusted, will defeat the Democratic party next year. "The result," says the *Press*, "simplifies the issue between the two parties, and makes a straight, direct fight on the command ing issue of protection." The *Times* is even more extravagant. It says that the only chance the Democrats have is to nominate Mr. Randall for President. Philadelphia seems to be a sort of blue grotto where there is no diversity of color, but everything wears the same cerulean tint. Protection, in the view of the *Press*, is evidently the highest rate of duty on any article which anybody desires to have. Mr. Carlisle's supporters might easily say that they think $18 per ton on steel rails too high, when the domestic article is selling at $35 and the lowest price abroad is $23. They might argue that a duty on lumber which sets a premium on the destruction of our narrowing forest area is unjustifiable and ought to be at once repealed. They might argue in the same way concerning the duty on copper. They might even attempt to justify the action of the last Congress (Republican in both branches), which lowered the duty on wool nearly two per cent. In short, they might be so unreasonable as to deny that protection has any of the elements of a "straight, direct fight" in it, and to insist that the issue is wholly one of percentages, as, whether silk shall be taxed 60 or only 50 per cent.; whether common table crockery shall pay 70 or only 60 per cent.; whether the whole canning industry of the country shall be sacrificed to the whim of some firm that wants to make tin plates, but can only do so at a loss, etc., etc. Before any issue can be made on protection, protection itself must be defined, and this will involve as many figures as are to be found in a table of logarithms. We can see nothing in the prospective overhauling of the tariff which need terrify the Democrats or greatly elate any Republican newspaper.

For the present, however, the Democrats are to all outward appearance committed to the policy of a gradual reduction of the tariff in the direction of a tariff for revenue only. There are two ways for the Republicans to meet this. One is to test Democratic sincerity by co-operating heartily in the careful and moderate reduction of taxation, which it is now very clear the country demands. The Republican party built up our present system of taxation, and has gone a good way toward paying off the war debt; it should, therefore, make a special effort to take the lead in bringing back that system to the normal peace footing, even if that be a protectionist footing.

The other way is to shirk all discussion of our present system of taxation by denying that there is any fault to be found with it, either as regards its incidence or amount, and by pretending that, such as it is, the prosperity of the country has been wholly due to it, and not at all, or only in a very small degree, to our national resources, or to the skill or industry or ingenuity of the people. This ground once taken, of course other absurdities will have to follow. The sectional issue is to be revived by declaring that Mr. Carlisle's election, although he was a Union man throughout the war, means another collision between the solid South and the solid North, and that therefore Republican voters, instead of expressing an opinion at the polls upon the amount of duty which should be levied on foreign imports, must again "vote as they shot" and "make it hot under the old flag." It appears, too, that the Irish voters in the manufacturing towns are to be called to the polls, not to express their opinion about the taxes they ought to pay in their adopted country, but to express their hatred of England and their undying remembrance of "six hundred years of wrong." In short, the strongest sort of appeal is to be made to what is most irrational in their mental constitution, and to the passions and prejudices which most seriously diminish their value as American citizens

The history of the Democratic party, however, during the past twenty years ought to be a solemn warning to Republicans against trying to live by clap-trap or dead issues. The Republican party is likely to fail far worse in any such undertaking than even the Democrats did, because of its great dependence on the independent vote. The force with which it wins at elections is now made up almost wholly of a class which cannot be humbugged or hoodwinked by appeals and fallacies which seem to be intended for European peasants rather than for American citizens. Moreover, the revival of old cries is still less open to it than to the Democrats. The sectional issue was abandoned in 1880 for the simple reason that it was worn out. It would never have been abandoned by a certain class of politicians for any other reason. It would take another war to give it any value now. If Republican politicians should be set to work to revive it during the coming year, on the stump, they would make the party so ridiculous that it would be overwhelmed long before November, 1884.

MR. BLAINE'S WHISKEY SCHEME.

MR. BLAINE'S letter recommending the distribution among the States of the proceeds of the Federal tax on whiskey, in order to relieve them from the burden of their local expenses, has probably answered nearly the whole of his purpose in writing it, by becoming the subject of an article in nearly every paper in the country. As materials for "copy" it has been a remarkable success. It was exceedingly shrewd of him to produce his plan as an amendment to the scheme of the Pennsylvania Protectionists for dividing redundant revenue among the States. By pointing out several serious objections to this, Mr. Blaine gives a delightful air of judiciousness and moderation to his own. A man, every one will say, who sees so clearly the defects of the Wharton Barker plan cannot but have carefully considered the whole subject, and anything he says about it must be worth weighing.

His suggestion is that the Federal Government should not go into partnership with the States in levying taxation, which it would have to do if it were to surrender the redundant revenue generally to their use; but instead of this should hand over to the States the entire proceeds of a particular tax, to be levied on one very hurtful, not to say immoral, product. From this tax he estimates a yield of about $86,000,000 annually, which he proposes to divide among the States in proportion to their population. This would relieve the great

majority of them of the whole burden of local taxation, and at the same time discourage a very hurtful branch of industry.

It is difficult to say, at present, how much need there is of stating the objections to this scheme. At present it does not seem, much more than the Wharton Barker scheme, to lie within the domain of practical politics. The constitutional argument against the power of Congress to levy and collect taxes for such a purpose is probably not overwhelmingly strong. To raise money for distribution among the States may possibly be providing for "the general welfare of the United States," even in the strict sense of the term. But there are a great many things which are constitutional and at the same time highly inexpedient, and even sometimes ridiculous; several which Congress undoubtedly has the power to do, but which no sane man would advise its being permitted to do. It might maintain an army of 500,000 men so as to be wholly independent of the State militia, either in executing the laws of the Union, suppressing insurrection, or repelling invasion; but no one would advise its doing so, and the people would certainly not permit it to do so. Probably it would be difficult to devise anything which would constitute a more decided step toward centralization than the assumption, which both Mr. Barker and Mr. Blaine propose, by the general Government, of the payment of the local expenses of the several States. In other words, the really serious objection to the Barker plan is the really serious objection to the Blaine plan, but Mr. Blaine has got the better of Mr. Barker by producing his scheme as part of a great work of moral reform—a piece of strategy which Mr. Barker overlooked.

Whether the money which the Federal Government is to furnish the States, is raised from whiskey, or from tapioca or arrowroot, really makes very little difference. The consequence in either case would be that the local government would be relieved of one of its most useful and serious responsibilities, in the careful assessment and proper and honest collection of the taxes for local purposes. There is nothing more essential to the safety and perpetuity of free government in the United States than the imposition on the inhabitants of the several States of the duty of providing the money which is to be spent on local objects, and looking after its careful and honest expenditure. If this were taken away, only a mere simulacrum of local government would remain; and if local government be not necessary to the existence of a healthy and intelligent interest in politics on the part of the people, and to the maintenance of ordered freedom, then the Constitution itself is a huge mistake, and nearly everything that has been written by the friends of republican government as to the conditions necessary to the success of republican institutions, is a delusion. No matter whether the States got their expenses paid out of the whiskey tax or out of a silk tax or a sugar tax, as long as the tax was levied by Congress, Washington would become the great and central source of political interest and political intrigue, to which all men's thoughts would be turned, and the State governments would be converted into mere almoners of Federal bounty. In fact, a very few years of living on the contributions made by drunkards in other parts of the country would kill utterly the already too feeble interest which the best portion of the population in many parts of the country now takes in real politics, that is, in measures of legislation and administration as distinguished from the nomination and election of officers.

The *Sun* has pointed out the absurdity of the Blaine plan in the case of prohibitory States like Maine, which, if their own laws were faithfully executed, would under it be drawing all their expenses from the drinking people of other States. It is to be hoped, and indeed expected, that, with the progress of civilization and the spread of education, the consumption of liquor in all the States will decline. No patriotic man will reconcile himself to the thought that the United States shall continue to receive $86,000,000 from the whiskey tax. Unless all that is best in our institutions proves a failure, this source of income will decline. If there is to be any serious improvement in the mental and moral condition of the great mass of the people, it must decline. Every lover of his race must believe that Americans will consume hereafter less and less whiskey, and ought to strive to that end. What are we to think, then, of a Sage who deliberately proposes a change in the manner of raising the local taxation of the country, which would give every State the strongest possible interest in having the consumption of liquor all over the country maintained and increased, and which would make the distillery one of the most valued instruments of government?

THE PRINTERS AND THE PRESS

THE recent printers' strike, which, as far as the *Evening Post* is concerned, has proved abortive, has to a good many people been full of suggestiveness as to the nature of the present and future relations between the printing trade and the press, and more particularly the newspaper press. We have been asked again and again, during the last fortnight, how it happened that the morning papers of the city, which discuss with such fulness and freedom strikes that occur in other branches of industry, and especially railroad and telegraph strikes, should have preserved such deep silence with regard to the printers' strike, although it had taken place in nearly every one of their offices, and had ended in every case, except that of the *Evening Post* and *Mail and Express*, in surrender to the strikers' demands. This surrender must have been due to one of two causes—that is, either to a conviction that the tendency of wages in all branches of industry, printing included, was at this moment upward, or that the consequences of resistance, as regarded the newspaper business in particular, were too serious to be faced. As a matter of fact, it is notoriously untrue that the tendency of wages is upward. On the contrary, the tendency is downward in nearly all branches of business, and the coming winter promises to be a very trying one for workingmen. A strike was threatened a few weeks ago by the compositors of the Chicago *Tribune*, and the question whether an advance of rates was justifiable in the present and prospective state of the labor market was, by mutual agreement between them and the proprietors, left to the decision of three arbitrators, who unanimously decided in the negative, and their decision was accepted by the men. It is fair to presume, then, that the surrender was due to reluctance on the part of newspaper proprietors to face the immediate loss and inconvenience which a strike would undoubtedly have inflicted. The public, however, has a deep interest in knowing how great this reluctance is, and how far it will be carried, or, in other words, what are the exact nature and extent of the power possessed by the printers' trade union over the newspapers, and whether, if the newspapers succumb to it, it may not make itself seriously felt among the books also.

That the press should be controlled, even in a small degree, by any trade or industry, so as either to suppress or modify its utterances on any question of the day, whether political, social, or economical, would be a serious matter. No organization, however mischievous, can do much harm by having an organ of its own, as long as the organ is recognized as such. But the possession of a silent, unseen influence over the press in general, and especially the metropolitan press, by any organization, however respectable or meritorious or enlightened, either in its management or in its aims, would be very disastrous, not only for the readers of particular newspapers but for the country in general. There are not many things either in the political or industrial field so important as that the newspaper publishers, at least, should be masters of their own business, and, therefore, fully responsible for the use they make of their power. Whether they are so now in this city we do not take upon ourselves to say. But that they cannot continue to be so if their present apparent reluctance to resist the demands of the Typographical Union continues, is very certain. That these demands are growing and will continue to grow with each success the Union achieves, is also certain.

What its influence on the press would be we may guess from the manner in which the Union is managed, as illustrated in the case of the *Evening Post*. The methods employed to bring it to terms were such as only thoroughly unscrupulous and unprincipled men would resort to, and in the hands of such men the great body of the printers in the city have practically placed their freedom and independence. We do not believe that any demand upon the proprietors of the newspapers would be too daring or too mischievous for the managers of the Union to make. It is folly to suppose, if they find they are invariably successful in extorting an increase of wages by sheer trickery and intimidation, that they will hesitate for a moment in asking for anything else they take a fancy to—the dismissal not only of men who do not choose to join the Union, or of a foreman who does his duty, but of an editor whose writing they do not like—or that they will refrain from putting a veto on an article or on a topic of discussion. We ven-

ture to say that this tyranny already exists in some offices in this city to a greater extent than the public imagines, and to a very dangerous extent too; that is, that in a large number of them an article such as we published in our issue before the last, or even a much milder one, which criticised unfavorably the methods of the Typographical Union, could not be put into type or printed. Under these circumstances it is, of course, questionable how long the public can expect any free or profitable newspaper discussion of trade unions or their methods, or how long the Typographical Union will confine its censorship of the press to matters immediately connected with the printing business."

Its activity has in various parts of the country already taken the form of open attempts to muzzle the press by other methods than strikes in the printing offices. It has in Washington made efforts to "boycott" a newspaper by getting other trades to join in discouraging or preventing its sale. We have heard of one instance in which it has refused to set up advertisements of a particular class. The spirit which instigates such performances is one which everywhere grows with success. We do not mean to cast any special blame on the Printers' Union in this matter. There is hardly any organization in the world, which suffers directly or indirectly from the press, that would not muzzle it if it could. Any usefulness which the press possesses in the present state of society is due to the fact that it has grown too strong for nearly all special interests to meddle with it. The printers are the only class now which can directly interfere with its utterances, and it remains with the newspaper proprietors to say whether they will allow this new yoke to be put on their necks, or, by opposing it vigorously now, at the outset, compel printers to submit, in their business relations, to the social and moral obligations by which men in other callings have to be governed.

THE ADIRONDACK FORESTS.

The condition of the Adirondack forests is alarming. The remoteness of the region occupied by these forests from the great lines of commerce, and the inferior quality of the material they yield, have had the effect of long postponing their inevitable destruction. Within the last few years, however, changes have taken place in the values of forest property, which must appear marvellous to those persons who can remember the price of good pine lands in Maine, Michigan, or Pennsylvania twenty-five years ago, or who have been accustomed, up to a much later day, to find comfort in the stories of our inexhaustible forests. No forest is inexhaustible. Wasteful and negligent management will in time destroy any forest, as the American people are just now finding out. The great changes which have taken place in the value of forest property and forest products make it profitable to operate now in forests which a few years ago possessed little commercial value. This is already true of the forests in the northern part of the State of New York. As long as first-rate pine was plenty and cheap in other parts of the country, there was little inducement to cut inferior pine or spruce in a region where the facilities for lumbering are not great. At the present time, however, spruce lumber, and even the lowest grades of pine, command prices which make it profitable to cut off these Adirondack forests. Several large mills have been erected during the past year at different points in this region; the Adirondack Railway has been extended several miles into the forest for the purpose of transporting logs and lumber, and it is proposed to extend it considerably further next season. It is therefore perfectly safe to predict the entire extermination of the Adirondack forest within a comparatively short space of time unless vigorous measures can be taken to prevent it. Fire, as is always the case in this country, will be pretty certain to follow close behind the lumberman and destroy what is spared by the axe. Fires succeed fires, and the burning over, year after year, of the light sandy soil of this part of the State, will render it entirely barren, and unfit for agricultural purposes or even to produce another crop of trees.

Twenty-five years ago, the State might have acquired this whole territory at a merely nominal price. To-day, when the necessity for preserving these forests is at last really felt, it will be found an exceedingly difficult and expensive matter to place them beyond the danger of destruction. If this, however, is to be done, it must be done at once. If a delay of even another year is allowed to occur, the amount of forests to preserve in the northern part of the State will be so much reduced, and the market value of forest lands will be so much enhanced, that the possibility of treating this question in any comprehensive or proper manner will be gone. The real question now before the people of this State is, whether the preservation of the Adirondack forests is desirable upon grounds of public expediency; that is, whether the public can hope to obtain sufficient benefit from the expenditure which it will be necessary to make in order to obtain possession of these forests, to justify them in making it. In order to decide this question it will be necessary to consider what benefits the State at large may expect from the maintenance of a large area of forests about the head waters of its principal streams; and what evils may be expected to follow the destruction of these forests.

The climatic influence of the Adirondack forests, beyond their immediate neighborhood, is probably not great, so that the whole question resolves itself into a discussion of their effect upon the water supply of the State. What we must determine is whether forests in general influence the flow of rivers; and then what effect the destruction of these particular forests is likely to exert upon the water supply of the Hudson, the Mohawk, and other streams heading among them. If we turn to Europe we find that the destruction of forests has had a most disastrous effect upon the condition of innumerable rivers; and that where mountain forests have been destroyed freshets have developed torrents, towns and villages have been swept away, and valleys buried deep under heaps of stone and gravel. Such torrents have exhausted, in the course of a few weeks, the supply of water, sufficient under normal conditions to flow continuously throughout the year. Great streams have become dry or nearly dry for months every year; and agriculture, commerce, and manufactures have suffered as severely from an insufficient supply of water at one season as they have from too much water at others. Such have been the results of excessive and improper forest destruction in many European countries. The United States happily has not yet experienced such serious fluvial irregularities as have long wasted Southern and Central Europe. This is not owing to any difference in the relations between European and American forests and rivers, which are the same in all countries. It is probably owing to the fact that nowhere in this country has any very serious damage yet been inflicted upon the remote and often inaccessible mountain forests, in which most of our important streams take their source. The time, however, is fast approaching when it will be found profitable to the lumbermen to cut off even our least valuable and most remote forests. When these are destroyed, there is no reason to doubt that precisely similar calamities will follow their destruction as have followed the destruction of forests similarly situated in other countries.

A small portion of the Adirondack forest has yet, comparatively speaking, been destroyed; but nevertheless the water supply of the Hudson and the Mohawk has been seriously affected. There is already danger that the streams which furnish water to the Erie Canal will not be able much longer to maintain the supply, and that as soon as the forests are stripped from the steep slopes of the high ridges and peaks of the Adirondack Mountains the small streams which feed the canal, and the bed of the upper Hudson itself, will become filled with stones or sand-bars, and rendered unfit for navigation. The preservation of the Hudson River and the Erie Canal is of vital importance to the prosperity of the State of New York, and if it can be shown that they are in any way dependent upon the maintenance of a growth of forest in the Adirondack region, it will be the duty, and the first duty, of the next Legislature to take the necessary action to preserve this forest. We have examined this subject carefully in all its various aspects; and, looking at the matter in the light of the experience of other countries, and judging by the effect already produced upon the water supply in our rivers by forest destruction in this State, we believe that there is no exaggeration in stating that the future prosperity and even the commercial existence of this State are bound up with these forests, and that, unless we are prepared to abandon the natural advantages which made New York what it is, we must stop, and stop at once, any further destruction of the Adirondack forests.

THE GERMAN CROWN PRINCE'S VISIT.

The reception of the Crown Prince of Germany in Madrid has been such as to make it clear that he is looked upon by the Court, the army, and the people of Spain, not merely as

an illustrious guest, but as a future ally. That he came to show himself in the latter capacity, to render the friendly relations—not to say alliance—recently entered into at Berlin by King Alfonso and Emperor William popular among all classes in Spain, and especially in army circles, is more than probable. Mere courtesy and court etiquette did not require so speedy a return of a royal visit. Nor was it necessary—a journey of the nearly nonagenarian Emperor being out of the question—to burden the Crown Prince with the personal delivery of international compliments, at a moment when the oscillations of sentiment in Spain in regard to the new attitude of her Government toward France had not yet subsided, and when many a Spanish democrat might still be inclined to give vent to his sympathies for the French Republic, and to his antipathy against her Prussian despoilers, in the manner in which "the Uhlan King" was lately received by the populace of Paris. To unpleasantnesses of this kind, which are not always mere trials of stoic indifference, personages of such high standing do not expose themselves without an important motive.

But what can be the practical value of a Spanish alliance for Germany, or, more properly speaking, for Prince Bismarck's Central-European coalition? Does the coalition meditate an unprovoked attack upon France? There is not the least reason, not the least indication, to make one suppose it. And if it did, is there any probability of its being able to drag Spain, in spite of all her French and democratic leanings, into an offensive war with the neighboring republic? What has Spain to gain by it? Is Béarn, is Roussillon, to be conquered? The time for such conquests has long gone by. Louis XIV. was egregiously mistaken when he said, in placing a scion of the House of Bourbon on Spanish soil, "There are no Pyrenees any longer." They continue to be a most powerful barrier, both national and strategic. No Marshal of Spain will dream of fighting another battle of Toulouse; when Wellington fought his in 1814, the military power of France had totally collapsed. An attempt to invade France will be deemed fratricidal by the Spanish nation, and must prove suicidal to the Government. Or is the value of the alliance a negative one? Is the consummation of a Franco Spanish alliance feared, or rather the adhesion of Spain to a Franco-Russian alliance which might be formed one of these days? The addition of a Spanish army corps to the forces of France on the Rhine would be of very little significance. Nor could Alfonso be persuaded to aid the French republicans, by landings in Italy, in revolutionizing that peninsula against the Sardinian dynasty, or the Spanish people of to-day be induced, should a monarchical restoration succeed in France, to join in a French crusade for the reëstablishment of the Papal power, as it did in 1849. All such contingencies are so highly improbable, and so remote, that sacrifices and efforts to prevent or counteract them appear decidedly unworthy of so serious and bold a diplomacy as is the Prussian.

There is, however, another field where the military activity of Spain might become exceedingly useful to the coalition erected by Prince Bismark as a bulwark of Central Europe against Russia and France combined, and where the moral support of the coalition would be still more important to Spain. We mean Northwestern Africa, as a possible theatre of Spanish warlike expansion. Spain has small possessions, some interests, and bases of operations there; she is anxious for colonial acquisitions on her side of the Atlantic, which might compensate her for all she has irretrievably lost on the other side; and her generals can find no other field for earning laurels by the sword, unless it be in civic contests. In Morocco moulder the bones of King Sebastian, and of so many other Spaniards who have fought for the Cross against the Crescent, down to the times of Prim and O'Donnell. This land of the Moors, from which came the foes with whom she contended for eight centuries, Spain looks upon as her lawful prey. The conquest of Algeria, the ancient Numidia, by the French, sharpened her desire for the conquest of the adjoining ancient Mauritania. In the same way emancipated Italy longed and expected to unite Tunisia, the land of ancient Carthage, with her dominions. The treacherous snatching away of this prey by France drove Italy into the alliance with Germany and Austria-Hungary. It equally exasperated Spain, who now finds that France is bent on seizing alone all the heritage of decaying Islam on the African shores of the western Mediterranean, with the hope of one day converting the latter into "a French lake."

To persuade Spain to resume and steadily to pursue a bold and aggressive policy in Morocco, and thus make her suspend her sword over the right flank of the French in northern Africa, while Italy, powerful in her ironclads, would menace the left in Tunisia, would be a permanent weakening, if not disabling, of the Republic for warfare against a powerful enemy in Europe. To begin such a policy, Spain needs only the promise of Germany, which might be readily given, that a violent opposition to it on the part of the French would be deemed by the Empire a wanton provocation of the Powers allied for the sake of peace. Germany may be inclined to promise more direct co-operation with her fleet, for which she is said to be anxious to acquire a station, such as the port of Mogadore, on the Atlantic shore of Morocco. Aggressive operations in Morocco could be begun by Spain without a direct challenge to France—however threatening they might appear to her—and thus without a challenge to the Spanish democracy. The Cabinet which initiated them would strengthen its position; success would strengthen the throne. No more propitious time for beginning such a policy could be found than the present, when the anti-French animosity is still lively among the majority of the Spanish people, and France is inextricably entangled by her adventurous undertakings in the far East. These considerations seem to us to offer a plausible explanation of the German Crown Prince's visit to the Court of Spain and of his choice of the moment.

ORANGE ACTION IN ULSTER.

DUBLIN, November 17.

THE United States and the British Colonies are perhaps as much interested as we are in the solution of the Irish problem. The unsettlement and demoralization at home are confined within the limits of the British Islands. But to you and the Colonies are being carried principles and modes of thought which, so long as they are nourished from here (and probably long after), will take root and flourish and bear bitter fruit over vast territories and amidst untold millions of people. A heavy responsibility rests upon the public opinion and journalism of the United States. Nations owe duties to each other just as individuals do. How much the unity of Italy was promoted by the moral support of Great Britain! How much the anti-slavery cause owed to its British allies! The South would scarcely have attempted secession if it had not relied upon the sympathy of the governing classes in the United Kingdom.

So is it at present with the Irish question. You have opportunities of judging more coolly and broadly than we can; and we know that if the public opinion of the United States be clearly and steadily against us on any important point, we are pretty sure to be in the wrong. And yet even your judgment must often be warped. For instance, the leading organs of Protestant England and Ireland may naturally unduly influence you, and it is to be feared that the samples of Irish you have in your midst are too often not fairly representative of our real character and capabilities. One of my best friends in the United States lately wrote, "I no more think of your being Irish than of your being a Malay." On the other hand, you may perhaps bring to the solution of the problem theories regarding the rights of men and of nations which are not applicable in the case of Ireland and England. And since the majority in every country take sides from interested motives, your politicians are not peculiar if they try to advance their party or their personal aims by an easy acquiescence in cries or measures which affect a distant body politic, and can never, as they suppose, react on themselves. Still, I cherish a profound confidence in educated America arriving at a clear and helpful average opinion upon the subject. Your unimpassioned distance may outweigh in advantage our more intimate acquaintance with facts, blinded as we are by the heat and dust of the conflict.

The proceedings of the Government with regard to late events in the North appear to us Nationalists most unfair. You are aware how the matters stand. There is an open agitation in Ireland under the auspices of the National League. The objects of this League are to secure for Ireland self-government in local affairs perhaps such as your States have, and a system of peasant proprietary such as exists in nearly every part of the civilized world except the United Kingdom. No one believes that these changes can be effected by force of arms. Our weapons are words. In the course of the agitation there is much said that ought not to be said; but we can hardly expect here the ordinary moral responsibility for language such as there is in a free country. Everything written or spoken passes through Government sieves. The Government can at its own will, at any moment, forbid any meeting, silence any newspaper, and cart off the plant of a printing-office to the vaults of the nearest police station. Government reporters attend every meeting. The language for which Mr. Hartington suffered three

months' imprisonment in convict's dress, with plank bed and oakum-picking, is of course stronger than it is safe to utter upon any Irish platform. His words have already appeared in your columns; but I may be permitted again to quote them:

"I advise the tenant-farmers of this locality to come forward zealously, and give a fair day's wages for a fair day's work. The agitation which has been carried on for the last four years will be turned against them if they do not come forward now and assist the laborers in their hour of need. I have learned since I came here (the county of Westmeath) that a great many of the farmers had got a reduction of from ten to twenty-five per cent., and they should come forward now, and assist the laborers in their hour of need."

Our minutest actions are watched by the police. We are liable to arrest if out of doors after certain hours. A word, a look, the refusal to sell to a customer, the whistling of a tune, may at any moment subject a man, a woman, or a child to imprisonment with hard labor. It is under these conditions that public meetings are held throughout Ireland. I have never heard it asserted that the language uttered on such occasions has been exceptionally violent in Ulster, or that meetings have there been attended with disorder. And then the Orangemen, headed by Lord Rossmore, Lord Ernest Hamilton, deputy-lieutenants, magistrates, and gentlemen step in and declare they will have no more National demonstrations in "their" province. Not content with holding meetings of their own, which they would have a perfect right to do, and in which they would be supported to the last by the Government (and which some of the most trusted National leaders have pledged themselves to insist on their right to hold, in any part of Ireland), these Orangemen have waited for National meetings to be announced, some in almost purely Catholic districts, have then issued proclamations, called their followers together, by road and rail, and assembled at the same spot and hour, with the declared determination to prevent the announced demonstration. They have resorted to open force upon more than one occasion. They have used language in comparison with which Mr. Hartington's is "as moonlight unto sunlight, and as water unto wine."

Under such circumstances the duty of the Government would appear to be plain, to mete out the same measure to Protestant noblemen and gentlemen, in Ulster, as it metes out to the mass of the people throughout Ireland. Lord Ernest Hamilton and Lord Rossmore are as fair game as Mr. Davitt and Mr. Healy. The Orangemen tried their Derry tactics in Glasgow the other day, and placarded their intention of preventing a lecture which it was announced Mr. Sexton, M. P., would deliver. Whereupon the Lord Provost did what the Irish Government, with its 50,000 troops and police, and a dozen coercion acts at its back, failed to do—declared his intention of supporting liberty of speech. He called on the military and police to protect the hall, and Mr. Sexton gave his address unmolested. Now what has been the action of Mr. Gladstone's Liberal Government in Ireland as administered by Earl Spencer and the biographer of Macaulay and Fox? It has done precisely what the Orangemen wished it to do, "proclaimed" the National meetings. It has been fair in this respect as regards the County Fermanagh—it has forbidden the carrying of arms to both parties alike; but we may feel sure that few of those gentlemen who lately advised their adherents to bring with them "their sweethearts and plenty of provision" (meaning revolvers and ammunition) will be refused licenses. It will be interesting to hear what defence the Government will make when Parliament meets. The *Times* is of course well satisfied, as it always is when force is applied to the solution of the Irish problem. It says: "The decision of the Irish Executive . . . has been welcomed with unalloyed satisfaction by sensible men of all parties." How do the American people and press feel in this matter? I am reminded of Gibbon's words: "As they punished only their enemies, they were obeyed only by their adherents." A high official in Dublin Castle told a friend of mine a few days ago that "Earl Spencer was rapidly following in Mr. Forster's footsteps."

In considering the question, you must remember that while the reported language of too many of the Nationalists is violent and in bad taste, often addressed as it is to inflammable audiences, the private sayings and attitude of their opponents are worse and more irritating. Many of the most violent Nationalists show themselves in private conversation to be reasonable men, while the freely-expressed extreme opinions of the ascendency party in Ireland appear ingrained in their very nature. I have never heard more wicked utterances than in private, at eating-houses, in public conveyances, against the tenantry and people of Ireland. Whether from conscience or policy such language is seldom uttered in public, but this vindictive and contemptuous attitude of mind must make itself felt, and with the most baneful results to the community. Moreover, conservative public pronouncements of this character are not exposed like the extreme words of Nationalists. The *Freeman's Journal* prints both alike, but I have turned to the *Daily Express* in vain for reports of such speeches—as one in which, the other day, the nominee of the Constitutional party for the Mayoralty denounced Mr. Gladstone as "a traitor to his country, and a traitor to his God"; or as another in which on Thursday evening, at a Conservative gathering, a professional man heaped the vilest insinuations upon Mr. Parnell and some of his party.

I will conclude this letter with a portion of a speech delivered the other day, by a Belfast Protestant manufacturer, to his 300 Protestant workpeople, who had persecuted from among them a few Catholic girls. It shows that while religious bitterness has for the most part died out in open party warfare, it still subsists among the population from whom the Orangemen are recruited:

"I have little doubt that you all feel very happy and delighted at having, by cruel intimidation, driven a few quiet, respectable, and inoffensive girls from these works, and are under the impression that you have accomplished a glorious victory, of which you are exceedingly proud. Is this not so? Your doing so has forced me to believe that you are just the right sort to tyrannize over the weak and helpless, and who would, if you dared, establish an inquisition where you would try and condemn Papists to be burned, and for a pastime hunt and hang Presbyterians. . . . You are a disgrace to Protestantism, and had you lived in the times of this good king (William III.) who fought and won the battle of civil and religious liberty, you would have been found in the ranks of his bitterest enemies." D. B.

THE LUTHER CELEBRATION AND ITS SEQUEL.

BERLIN, November 14.

THE last fortnight of our (and of a great part of European) life has been taken up with Martin Luther. Demonstrations and festivals of all kinds were celebrated all over the country and abroad. The old towns and places interwoven with the prominent events in Luther's history, such as Eisleben, where he was born and died; Erfurt, the university where he studied; Wittenberg, where he passed the best part of his hard-working life; Worms, where he stood before the Emperor and uttered the immortal words: "Here I stand; I cannot do otherwise. So help me God, Amen"; the Wartburg, where he translated the New Testament, and the old castle of Coburg, in the solitude of which he continued his studies—all these, with more or less pomp, splendor, and taste, celebrated the 400th anniversary of the great reformer's birth. They were joined, of course, by all the Protestant cities of the Empire. The German Lutherans in Catholic towns and provinces did not stay behind, and with spontaneous enthusiasm did honor to the great national hero. In non-German countries, as in the Russian Baltic provinces, in Norway and Sweden, Denmark and England, Holland and Switzerland, the interest of the people was as genuine as in the districts where the Reformation originated, suffered, and only partly triumphed.

In Prussia, the leading Power of Protestantism, the most orthodox wing of the Lutheran Church tried to make capital out of the great national movement for its own selfish ends; but its designs were baffled, first, by the Crown Prince, who invited the Liberal Protestants to join him at the first Wittenberg celebration, and proclaimed mutual good-will and forbearance as the duty of every patriot; and next by the masses, who cared more for a national than for a sectarian commemoration. Thus the good sense of the Crown Prince and the current of popular feeling proved stronger than the arrogance of intolerant clergymen and reactionary country squires. In Berlin, the University and city authorities vied with the Government in making the celebration an imposing holiday. Although the Berlin Mayor is a Roman Catholic (but not of the infallibility stamp), the President of the Board of Councilmen a Jew, and although three of the State Ministers are Catholics, entire harmony of feeling prevailed. One of the finest features of the day was the procession of about 100,000 school children, who in large squads marched to the churches and were presented each with a popular biography of Luther. All classes of the people appreciated thoroughly the importance of the day and looked happy and elated. Flags waving from housetops and towers; music playing the great hymn of the Reformation, "Eine feste Burg," and chorals; banners stretching from one side of the street to the other; fresh green wreaths and garlands decorating private houses and public buildings or thrown on the pavement, made a highly festive impression.

The conduct of our Roman Catholic brethren was not what it ought to have been. While nobody expected them to participate in the celebration, they were likewise expected not to manifest their anger toward it. It was only a practical joke that Herr Windthorst, the leader of the Ultramontanes, half clown and half statesman (imagine such a compound!), proposed a day of Roman Catholic humiliation and prayer for the sins of the followers of Luther, and for their return to the bosom of their loving mother. This comical proposition, of course, was laughed at by the Protestants, and even not heeded by the most bigoted Catholics. The attempt of the leading paper of this city, the *Germania*, to renew at the end of the nineteenth century a style of warfare which, more than two hundred years ago, was initiated by the Jesuits, and even then derided by all except the mob, likewise proved futile, although dozens of pamphlets followed in the wake of the *Germania*. There is no foul slander, no mean epithet in the German language, which was not used in their attacks upon Luther's character. They transformed his name into "Luder," which means carrion—an invention which, however, has not the merit of being new,

as it was manufactured at the outbreak of the Reformation; represented his father as a murderer and his son as a rebel, a robber, and a usurper. The actions of such a criminal were of course dictated by low ambition or lust, and his heroic life was nothing but a mixture of treachery and meanness. It is not quite certain, says one of these pamphlets, published in the Prussian city of Treves, whether this unprincipled monk (Luther) died of debauchery, or whether finally "the devil came for him."

So far as I know, there was only one prominent Roman Catholic who appreciated the full importance of Luther—I mean Ignatius Doellinger, of Munich, perhaps the greatest scholar in the history of his Church. He wrote to a friend that Catholics too were obliged to do homage to one of the greatest sons of Germany, and that they, as well as Protestants, ought to celebrate the 400th anniversary of the day on which Luther was given not only to his own country but to the whole civilized world. Of course Doellinger is right. We all—our modern civilization—stand on the shoulders of Luther. It was he who, in overthrowing the despotism of Rome, did away with the Latin dogma and reconquered the liberty of conscience and the autonomy of the individual. It was he who thus aroused the world from mental slumber to intellectual activity, and made the Teutonic race the leader in modern history. I cannot dwell at length upon the history of the Reformation, its spread to England and America; but your own political development is based on it. I think you will agree with me, that that grand thesis of ninety-five paragraphs which, on the 31st day of October, 1517, Luther nailed on the chapel door at Wittenberg, finally, after more than two centuries and a half, found its synthesis, when, on July 4, 1776, in the State House at Philadelphia, the young rising republic of the West made its Declaration of Independence and established liberty of conscience in politics. Thus Wittenberg and Philadelphia stand in close connection. Luther and his co-workers were the originators of the Reformation of the Church—Washington and his compeers, of that of the State.

But, even his merits as a reformer set aside, Luther has other peculiar claims on the gratitude of the German people. Our language would have been stifled in a dozen different dialects if he had not elevated it by his classical translation of the Bible and by his hymns; our schools would never have reached their comparatively high standard if he had not established them on a sound pecuniary basis, and extended the sphere of their useful activity. The Roman Catholics also ought to revere him, as his fierce warfare on the old Roman Church did away with the wicked Popedom of the Middle Ages, and effected the so-called Catholic counter-reformation.

It is a pity that in the present exasperation of minds, and in the midst of a conflict which for the past ten years has been raging with almost mediæval passion, greater stress had to be laid on Luther, the reformer and manly fighter, than on the patriot, the scholar, and the peaceful organizer. On the whole, the sacerdotal character prevailed in the festivity all over Germany, and introduced a certain narrow-mindedness which manifested itself even in Berlin. The old Emperor, who was present at the services in the St. Nicholas Church and the Cathedral, on this occasion considered himself merely as the high bishop of the Protestant Church and invited only Protestant dignitaries. Besides, the speeches and sermons of those days abound only in monotonous praise. Why not represent Luther as he really was? Why whitewash his stubbornness and other faults; why conceal his shortcomings and chiefly attack his opponents, who in a great many instances stood above him? Take only Zwingli!—not to speak of Thomas Münzer and Karlstadt! A really great man, such as Luther is and always will be, still remains great even if he often errs. Not a word was said about the phases which he underwent in his long life. From the time when he first (on October 31, 1517) attracted public attention in Wittenberg, down to his appearance before the Diet of Worms, in April, 1521, he was the great national hero. From 1521 to the outbreak of the great Peasants' War, in 1525, he was the great revolutionary leader who appealed to the masses for the support of his work, and obtained it. These eight years, from 1517 to 1525, are the most fascinating and the noblest period of his life, during which he was the most popular and the most respected man of Germany and of Europe; but then he became afraid of the consequences of his own doings, cried for the police against Münzer and others, became an established clergyman, and cared only for securing his religious reformation under the shelter of petty princes, who protected him for a very valuable consideration, namely: the confiscation for their sole profit and interest of the estates of the Church. Nevertheless, Luther is one of the representative men of history.

Awakened by the enthusiasm of the Luther commemoration, some plans have been formed to perpetuate the memory of the present celebration. First, it is intended to erect a statue of the reformer in a most conspicuous place in Berlin, as the largest Protestant city of the Continent and the capital of the German Empire. The principal promoters of this plan are the members of the Gustav Adolf Verein (the Liberal wing). Some propose to place the statue opposite the Great Elector on the King's Bridge and fronting the finest part of the old Castle. The collections promise rich results; they will at least produce a sum sufficient to pay for a first-class work. All the Berliners can desire is that the statue to be cast shall equal Siemering's statue of Luther which, on the 10th instant, was unveiled at Eisleben. It is really a masterpiece of sculpture. By the way, this Prof. Rudolf Siemering is at present engaged in modelling a large equestrian statue of Washington for the Philadelphia Cincinnati. In my opinion it is equal to Rauch's Frederick the Great. Besides, a committee has been organized for the collection of a capital of several millions for the education of the sons and daughters of poor teachers and clergymen. The ultra-Orthodox wanted to confer this benefit only on the sons of clergymen who should become theological students; but the more liberal men succeeded in having it conferred also on children of teachers, and in not limiting the stipend to theologians, but in allowing all the stipendiaries to follow any trade or profession. This movement too, spreading all over Germany, and headed by the most influential gentlemen, will be a decided success.

It is, however, more than doubtful whether a third plan will safely reach port. It contemplates the erection of a new "Luther Church" in this city. There is no sympathy for it, for the reason that the first idea was advocated by our Orthodox, who play the part of black gendarmerie in our political life, and that Berlin has already too many churches, which are far from being filled. Some years ago, when the Berlin Magistrate was applied to for a contribution for the erection of a church which was to be built in one of the new suburbs, an inquiry was made in order to ascertain whether or not the neighboring churches could accommodate a few hundred more new comers. The Committee found that in one of these churches the highest number of visitors was eleven, and that in the other it amounted to twenty-three. Among the latter were sixteen old ladies, who took their nap; five gentlemen, who liked the cool air in the heat of the summer day, and two baby Christians with their mothers. The Magistrate accordingly refused to act in the premises, and in the present instance, I apprehend, the pious Berliners, too, will decide that there is no need for a new church, even if it be for Luther.

Let me finally call your attention to some prominent publications on Luther's life. The best and most complete of all is 'Martin Luther: Sein Leben und Seine Schriften,' by Dr. Julius Köstlin, Professor at the University of Halle, in two large octavo volumes, which has just been published in its third edition. The first appeared in 1876, and the second last spring. For the thoroughness of its investigations, the accuracy of its details, and its fine style, this standard work was crowned with a prize of 1,000 thalers by the Prussian royal committee which had to decide on the merits of historical works which had been published between the years 1870 and 1880. An epitome of this larger work has just been published for the anniversary, and has been translated into English. It is well worth reading. A work not less conspicuous, and perhaps more comprehensive, is that which Prof. Max Lenz, of Marburg, Professor of Modern History, has written for the Magistrate of Berlin, who has distributed it in the higher classes of the gymnasia. In my opinion it is best adapted for the general reader, as it represents Luther in the light of his time. It does not fill more than 300 pages, 12mo, and ought to be translated into English. Popular and cheap pamphlets for schools have been written by the court preachers, Rogge and Frommel, of which several hundred thousand copies have been distributed. They are finely illustrated, and cost only twelve cents and six cents apiece respectively. The best contribution, however, to the glorification of November 10 is Herrman Boehlau's new critical edition of Luther's works, in royal 8vo, to be published in about thirty-five volumes, at twenty marks each, and superintended by one of the most learned Luther critics, Mr. Knake of Drackenstedt. Theological seminaries, students, and libraries cannot in future dispense with this new edition of Luther's works. In New York it will be found at E. Steiger's, who has taken thirteen copies, as I see from the subscription list.

Correspondence.

THE SPEAKER.

To the Editor of The Nation:

Sir: I imagine that many if not most of your readers, in following the fierce struggle over the Speakership as reported from Washington, have wondered what there can be to cause so much excitement in the mere office of presiding over the business of the House of Representatives. They are perhaps not aware that the Speaker is by far the most powerful individual in the Government, much more so than the President or any member of the Cabinet. The Speaker makes up absolutely at discretion all the committees which do the business of government, subject only to the established custom of naming a fair minority from his political opponents. When it is considered that these committees, working in secret, have, to say nothing of their positive power in shaping the policy of the Government, a nearly perfect negative power of stifling any movement or action which they do not like, it

becomes evident how important is this function of the Speaker. Add to this, that after the committees have reported, the Speaker, through his power of "recognizing" at his pleasure members desiring to speak, can throw the chances of political manœuvring very largely in favor of his political supporters. With all this power the Speaker is completely irresponsible either as regards the nation or the Executive. He is bound only to the party majority which has elected him, and after such a conflict as the present we may be sure that to them he is bound hand and foot.

It is a curious instance how, in spite of all our dread of one-man power, our affairs tend to drift steadily more and more in this direction. The fact is that there is an absolute necessity for some organized leadership in Congress. A passing comment of Mr. E. A. Freeman, in his "Impressions of the United States," is very much to the point:

"One incident specially struck me as illustrating the constitutional provision (*sic*) which shuts out the ministers of the President from Congress. One representative made a fierce attack on the Secretary of the Navy, and the Secretary of the Navy was not there to defend himself. Generally, I should say, the House of Representatives and the legislative bodies which answer to it in the several States illustrate Lord Macaulay's saying about the necessity of a ministry to keep a Parliament in order. One result of its absence is the far larger powers which in these assemblies are given to the Speaker. And this is again attended by the danger of turning the Speaker himself into the instrument of a party."

Boston, November 30th.

THE SOUTH IN THE NATIONAL REPUBLICAN CONVENTION.

To the Editor of The Nation:

Sir: As you have correctly pointed out in your paper, there is a strong effort made to repeat, in the 1884 Republican Convention, the spectacle of a solid Republican South. This result will be inevitable if the President continues in his policy to take advice, as to the South and Southern officials, from those who at present control Southern Republican patronage. It seems from the choice of such advisers: 1st. That the President either does not know or does not believe there are any decent Republicans in the South. 2d. That, at court, an impression seems to prevail that there are no Republicans in the South worth consulting, except those who either seek or hold office. 3d. That the policy pursued by certain Southern politicians in preventing any decent accessions to the Republican party, so as to keep it, as to numbers, within such a compass that there shall be no more white Republicans than necessary to give each of them an office, is especially approved of by the President and his advisers, or is acquiesced in by them from an ignorance of the true state of the facts. Just think how untrue it is, and how much more untrue it becomes every year, that we exercise the right of free citizens in the choice of our officers. It is the same from the President down to the constable in the smallest civil district. In no case has the popular voice any real choice. Look at the composition of a National Convention. Ward politicians and local wire-pullers make politics so disgusting that no decent gentleman has anything to do with them. Under this state of facts local conventions, to appoint first State and then national delegates, are held by these ward politicians and local wire-pullers. The delegates thus constituted meet and agree upon a choice, in which the people have to acquiesce. Now that is not enough. It so happens, in the circumstances herein suggested, that the choice of nearly one-half of the delegates, or at least of a respectable working minority, is made up from the Southern States, where none but office-holders or office-seekers control such affairs. And that is called a National Convention of the party of great moral ideas!

Is it not time that the tide of these evils should be checked? If the President really does not mean to work for a renomination, or if he intends to be renominated only if it can be done fairly, why does he not examine the true condition of the Republican party in the South?

Unus.

Nashville, Nov. 24, 1883.

OUR REPRESENTATION IN ITALY.

To the Editor of The Nation:

Sir: In anticipation of the meeting of Congress, and that information may not be wanting as to the state of our relations with Italy (though with faint hope that either public opinion or official wisdom will be moved by what is to be said), I beg to call attention to our official representation at Rome. Last year I showed that, owing to the ill judged attempt of our Government (properly, I suppose, a Congressional committee) to force the hand of Italy, the Italian ministry had refused to recognize as Consul-General the gentleman appointed to that office, in pursuance of the economical policy of accumulating the offices of Consul-General and Secretary of Legation on one representative. The Italian Government has from time immemorial refused to recognize a consul as a diplomatic officer, and even, until Mr. Marsh induced them to relax the rule, to allow the consulate-general of any foreign country to be established in the same place as its legation; and when our Government, ignoring (as it has done during the past year) the rebuff in its attempted violation of Italian official etiquette, persisted in forcing on the recognition of Italy a consular officer accredited with diplomatic functions, the King's Government replied in the only way left it, by refusing to recognize the consulate-general, and has ever since ignored it completely, requiring the authentication of signatures, etc., as far as official recognition is concerned, to be made by the legation—*i. e.*, officially cutting the consulate dead. I suppose that our Department of State cannot be ignorant of the egregious discourtesy involved in thus persisting in a pretension which in the beginning was an act of impoliteness, such as in private intercourse the rudest member of Congress would hardly venture on; but the Department has been in many cases, and I believe was in this, overruled by the action of men utterly ignorant of diplomatic etiquette. It is just as well, therefore, that the country should be advised that the Government of Italy has not relaxed, and will not relax, its regulations; and that our Consul-general does not, and under the present régime will not, exist for it; and that instead of economizing, as Congress intended, we are wasting the salary of the Consul-General, and keeping up an insulting farce at the court of Rome, thus augmenting the reputation of America for a lack of either politeness or intelligence. The only step our Government can take in common decency is to move the consulate-General to some other city—Turin, Milan, Florence, or Naples. From its general convenience for Americans and central situation, of course Florence would be the best, and doubtless the most grateful to the Italian Government.

But this is not all the story. The present state of our aggregate representation illustrates curiously the awkwardness of our position. We have at this moment no proper official representative at Rome, unless either the Minister or the Secretary of Legation has very recently returned, of which I am not informed. Mr. Astor and Gen. Richmond are both away on leave of absence—there is no Consul-General or Consul, and the Vice-Consul-General is Mr. Hooker, a banker, who of course, as any banker would, values the connection at so many francs a year in the business of his bank. The respectability of allowing our official character to rest in the hands of any banking establishment is questionable, but here we have the legation and consulate mixed up with a banker who was, during our war, known as the most actively disloyal Northern man in Rome. In his hands is now the entire dignity of the United States of America. I believe he gives a room in the bank for the use of the legation, and the arms of the United States serve as the sign-board of his bank. We have a consular clerk who is appointed and paid by the Government, and is, I believe, a most competent officer and actually performs all the duties of the consulate-general; but he is, by our ingenious system, not recognized as a public official, and for the Government of Italy does not exist.

I have nothing to say of the *personnel* of our official representation. The position is not of their making, and they are not responsible except for the anomaly of the Minister and the Secretary being absent at the same time; but it is clear that if our national character is of so little importance that it may be left in the hands of a banker for months at a time, a wiser economy would abolish it altogether. To suppose that Congress will pay any attention to the dignity of the country abroad, is doubtless a dream; but then let public opinion insist on respectability or economy. It is probably to the hammering of exasperated Philistines and outsiders like myself, that we owe the slight reform in the consular and diplomatic service—a reform which, as to the personality, is considerable, and most grateful to one who remembers it in past years, but which, so long as the system is not legally reformed, secures nothing. Let it be made a law that no man in trade, no banker or shopkeeper, or man interested in any business in the place where the consulate or legation is located, shall have any official connection with it. We are not so poor that we cannot pay our representatives. We do not at present pay them enough—in many cases not living wages to an *honest* consul; but we can at least keep our name abroad from being "put up the spout," either by paying or abolishing the places we can't pay.

W. J. S.

November, 1883.

DEFECTS OF THE HOMESTEAD LAW.

To the Editor of The Nation:

Sir: In a report to the United States Land Office, on the working of the homestead law, by Mr. E. T. Bickford, it is stated that a large proportion of homesteads in Dakota are claimed by persons who are not actual settlers. One need not go as far West as Dakota to find a similar state of affairs. It may safely be said that 25 per cent. of the homesteads in the State of Wisconsin are claimed by lawyers, merchants, tradesmen, and other people, who do not at all intend to make their homesteads their homes. They erect a rude log-cabin on their claim, in which they spend a few pleasant summer days every year, and, five years later, offer to make final proof. Any one of their neighbors is ready to bear witness that they have complied with all the requirements of the law. I recall the instance of a widow lady from New York, who used to spend the summer with her friends in this village. She claims to be the legal owner of a fine homestead in this county, yet I doubt whether she has ever so much as seen the place. Our homestead law

certainly needs an alteration.—Very respectfully,
ERNST BRUNCKEN.
MEDFORD, WIS., Nov. 22, 1883.

LITERARY RESEMBLANCES.

TO THE EDITOR OF THE NATION:

SIR: The tribulations of authors will apparently never cease. Here is an English correspondent of the *Literary World* writing from Germany of the appropriation, by the veracious Charles Reade, of an incident in one of Grimm's Fairy Tales, and of its interweaving by that fertile author into one of the innumerable stories which he is flinging off right and left—this time into the columns of one of the Harper publications.

The object of this letter is not nearly so wicked, but simply to recall to some of your German-reading readers the remarkable resemblance between a picturesque incident in Mr. F. Marion Crawford's 'Roman Singer'—the story of Nina's love-confession to Hedwig von Lira—and Grimm's "Dornröschen," in which the hedge grows up around the enchanted castle, and suddenly, on the approach of the lover-prince, breaks into blossom. I do not assert that this is a case of plagiarism, but the incidents are sufficiently alike in the two stories to haunt one with a feeling that one may have suggested the other.

J. A. H.

LEXINGTON, VA., Nov. 25.

THE SENIOR SOCIETY EVIL AT YALE.

TO THE EDITOR OF THE NATION:

SIR: There is certainly no good reason why secret societies should exist in any college. Without doubt the element of secrecy works a great harm both at Yale and elsewhere; but that Yale in particular is handicapped by its society system is not true. The writer, an undergraduate and a non-society man, is greatly surprised to learn, through the correspondence columns of the *Nation*, that he and the majority of his classmates are under a tyranny of two senior societies having a membership of thirty, about equally divided between the best and the very weakest men in the class. So much of your correspondent's letter is absurd. And in regard to another part of it, I speak for a large number of my classmates when I say that as long as we have minded our own business we have not been in the least annoyed by mystic scarf-pins or the increasing size of "Bones" hall. Furthermore, after nearly four years of college life, our loyalty to Yale is by no means destroyed because we do not happen to be members of this or that club or society. As to the statement that it is useless to appeal to the Faculty for redress of grievances because half the members of that body were society men in college, it strikes us as rather severe on the rest of the Faculty.

But without taking too much space, we wish to offer a few disconnected facts, which do not go to show that the secret societies are on the whole a benefit to the College, but which may temper the impression conveyed by the letters you have published. In the first place, Yale men generally agree that the strong class feeling here is, as a professor recently said, "a grand good thing." It promotes the democratic spirit for which the College is remarkable; and hence the class system of societies is at least more desirable than one which might tend to break up this class feeling. Again, the senior societies hold out elections as incentives to good literary work and success in athletics; for the valedictorian, the salutatorian, junior prize-man, successful college journalists and writers, and the men who distinguish themselves by faithful work in foot-ball, base-ball, and rowing are generally sure to "go" to either "Bones" or "Keys." This is the only real excuse for their existence. As to the death of "Linonia" and the other debating societies, they died a natural death here, as in other New England colleges. Indeed, debating societies seem to have followed the Star of Empire, and to day they flourish in Western universities.

As I said in the beginning, there is no reason why secret societies should not cease to exist in all colleges. But the point that I insist on is that the reform must come not from within, as "Graduate" suggests, but from without. The evil which your correspondents mention so indefinitely is simply the toadying of a considerable number in every class to a few members of the class above; and the harm done by the societies is that they encourage this toadyism, or "suping," as it is here called. These societies will cease to exist just so soon as a healthy college sentiment comes to recognize the fact that the traditional secrecy of fifteen or thirty college seniors is a very silly thing at the most.

SENIOR.

YALE COLLEGE, Nov. 27, 1883.

TO THE EDITOR OF THE NATION:

SIR: As a graduate of Yale I rejoice at the opening in the columns of the *Nation* of the discussion of what is aptly styled the "Senior Society Evil at Yale." No one can pass four years as a student in that institution without becoming deeply sensible of the overshadowing influence wielded by the two senior societies. If his judgment is not warped by a consuming desire to become a member of one of them, I venture to say it will be equally impossible for him not to recognize the fact that the influence of these societies is highly detrimental to the best interests of the College. There is not a detail mentioned in the recent communication of an undergraduate that is not borne out by the experience of every non-society man who goes through Yale.

To attempt to explain just why the College world should be so dominated by the small body of men who compose the membership of "Bones" and "Keys," would be a difficult task. There is no valid reason why thirty men should so largely control the minds of six hundred. The absurdity of the thing, however, makes it none the less a fact, and one which, as remarked by "Graduate," vitally concerns the welfare of Yale College. The tyrannizing tendency of the societies is no myth. It is as real as any influence that one feels at college, yet can with difficulty be described. The shackling of the College press is complete, and the high-spirited undergraduate feels the galling weight of the "society influence" when he learns that the columns of the College press, ostensibly organs for the free expression of College opinion, are closed to him if he desires to call the attention of his fellow-students to some subject which the mighty powers of the societies decide shall not be discussed. If the College community may be considered a world in miniature, and the College press as relatively the same to this little world as the public press is to the world at large, the simple fact of interference with the free working of this organ of public life should utterly condemn the system responsible for it. No one can conceive of an institution so beneficial in other respects that we should be willing to give into its unlimited control the press of the country; nor should a similar state of affairs be tolerated in a college, by those who profess to have at heart the interests of the institution they serve. I lay stress on this particular phase of the "Senior Society Evil" because it is in this way that the societies largely exert their deadening influence on the growth of an independent manhood at Yale. From the time of entering, the undergraduate, if he desires to secure a place in one of these gatherings of "the most distinguished men of his class," is subjected to a course of imposition, and if he dares call his soul his own he is at once set down as having "ruined his chances." As a consequence, where we should see manly young men we see too often only "supes."

That the loyalty of the Yale graduates is greatly lessened by the continued existence of the senior societies is a fact patent to all who are not wilfully blind. I was informed recently, by a Yale man, of a graduate (at the head of a preparatory school) who said that so long as the secret societies existed at Yale he should exert his influence against sending his boys to his Alma Mater. It is a question for the Faculty and Corporation to consider whether they can afford to ignore the existence of this sentiment among the alumni—a sentiment that must, if continued, be injurious in a high degree. "Graduate" suggests that, instead of abolishing the societies, they be entreated to discard their infantile regulations; but I think if they were to do this and also cease to be exclusive, they would scarcely have a *raison d'être*.

Gentlemen of the Faculty, you have in the bosom of Yale College an enemy to her progress. The feeling in regard to the society system may be unreasoning, but it exists, it is on the increase—and what do you propose to do about it?

EIGHTY-THREE.

MEDIA, PA., Nov. 24, 1883.

TO THE EDITOR OF THE NATION:

SIR: The senior societies of Yale have their advantages. Membership in them is an object of ambition to most underclassmen, as, *prima facie*, it is an evidence of superiority in learning, culture, good-fellowship, muscle, or wealth. The fraternity spirit in these societies is very strong, and one who has passed the mystic portals receives benefit therefrom, social or other, throughout his life. But, taken all in all, these societies are not an unmixed good. Till the close of the junior year, when the elections are given out, the student ambitious of being a senior-society man may be spurred on to extra exertion in some way that promises to win for him this honor; but, after election, this impulse is gone, and these societies cease to have any appreciable beneficial effect. It may well be doubted whether in any practical sense the members realize the ideal educated gentleman any more fully than they would have done had there been no such society. On the other hand, these societies are hurtful to their members, to those not members, and to the College at large. The last point has been sufficiently elaborated in these columns already, and all that has been said on this head is only too true.

According to Thackeray's definition, the senior-society man is essentially a snob, and the sentiment that makes him such is encouraged by his fellows to a point beyond the limits of absurdity, and becomes a source of constant annoyance and irritation to those without the pale. This spirit of snobbery breeds toadyism in underclassmen, and tends to paralyze independence and to prevent the development of true manliness. It makes invidious distinctions. It is undemocratic. It creates an aristocracy in what should be a republic. The Faculty and Corporation, almost to a man, are members of these societies, and are so biassed by their fraternal feeling that, in the distribution of honors, they are too often led into doing injustice to those not of the elect. The time is near when these societies must be reformed, or they will irreparably injure the College.

H.

ST. LOUIS, Nov. 24, 1883.

TO THE EDITOR OF THE NATION:

SIR: The communications attacking the "Senior Society Evil" at Yale, which appeared in the last two numbers of the *Nation*, have been read with much attention here. They have started anew the old discussion as to the good or evil of the present societies, and it is with a view of opening up the other side of the question that this letter is written.

At the outset I shall make the declaration that the senior-society system is an admirable thing. These societies are an incentive to men to work—an incentive the power of which cannot be appreciated by any one who has never lived beneath Yale's classic elms. From the day the freshman sets foot upon the campus to the day of the senior elections, he has something before him to work for—a distant goal, to attain which all his best qualities and powers must be directed. It is a race for glory, fame, honor—moreover, it is a race in which all start on an equality. The poorest freshman is on a level with the wealthiest, provided he uses his powers judiciously. It is human for man to wish to appear well in the eyes of his fellows, to win their commendation and respect; and such is the end which each man of spirit has in view who strives for election into the senior societies. It is a race in which the best men win. All that is admirable in man is brought into play to reach the desired goal. Excellence in scholarship and in literature, success as a skilful and well-trained athlete, a polite and ever gentlemanly deportment, the possession of a strong, manly character—these are the qualifications for election, these are the paths open to the undergraduate to pursue; and if one will look over the members for past years, he will find that nearly all shone under one or more of these heads. I say nearly all, for there will of necessity be some few men elected on petty considerations, but yet even these will be found to have been not without some merit. Ancestry and wealth have from time to time been qualifications for election. But can the upper classes be held culpable for taking men whose fathers and grandfathers have been honored members, or for taking men for their money when they also take deserving men too poor to pay dues, and whose expenses must be met by some means or other? I reassert then that the present system is a good thing, for it induces men to work for worthy ends, it encourages them to work in directions profitable to themselves and to the College; it frowns upon excessive dissipation—in fine, it develops and brings to light the good that is in a man, and sends him forth into the world far the better for his college experience.

The writer in the last *Nation* on this question offers some very sensible thoughts, but he errs sadly when he draws a picture of 150 out of a class of 180 rendered non-loyal to their Alma Mater after the bestowal of the coveted elections. In the first place, there have never yet been 150 men "left" in any class. In the second place, there have never been (to make the largest estimate) more than sixty men considered as at all eligible. There is in every class a large majority of the members who never stand even the slightest chance. These include the "digs," the fast men, the indifferent men, the lazy men, the independent men, the retiring men, and the class blockheads and fools. These men, I say, make up the majority of the members of each class. The remaining members are the candidates for elections, and in no class of my own experience could they muster over fifty men. Thirty of these, then, become the happy recipients of mystic emblems, leaving twenty "soreheads" rendered disloyal (as "Graduate" puts it) to their Alma Mater by their failure of election. These, and these only, are the men who return here to find this once dear campus without a charm for them; these are the ones who are "glad to get away from their college haunts." There is, I admit, on the part of this few a lack of patriotism toward Yale which shows itself in many ways after graduation. But the great body of the class has no such feeling of disloyalty. Any one who has been at Yale knows that he cannot hope for a senior election without some praiseworthy distinction of one sort or another. Those who do not try cannot expect to be rewarded. Poor taste indeed is it in any one of this class to raise a cry about the evils to the college of a system which bestows its honors on the deserving, and on them alone.

A secondary purpose for which this letter is written is to say a few words regarding the new senior society. The long-felt need of a third society at Yale has been met by the enterprise and courage of members of the last and present senior classes. To found a society in the face of the prestige sustained by the old societies by virtue of time and prominent graduates is no small undertaking. But the founders feel that with proper judgment and judicious foresight the enterprise promises well. At any rate, the foundation of a third society is assured. For the past two weeks building has been under way, and a society hall will be finished during the winter. That there is room for the coming society is universally admitted. It will fill a position in college life necessary to the welfare of old Yale. It will serve as the remedy which "Graduate" calls upon the Corporation and Alumni to supply. It will unite a certain number out of each class under a common tie, and prevent the decay of undergraduate enthusiasm. In general, by enlarging the field of contest and bestowing honors upon more men, it will create a healthier, less antagonistic feeling on the part of every undergraduate. X.

YALE COLLEGE.

TO THE EDITOR OF THE NATION:

SIR: I am glad to see, at last, in your columns a discussion of the evils of the secret society system at Yale, for I believe that system works great detriment to the true interests of the University. The absurdities of etiquette which those societies force upon college society at large are most puerile. For example, while rooming with an editor of one of the college papers, I found in the library an old Dissenters' Hymnal of a century or two ago. I was asked to write a brief article upon the book, giving extracts. I did so, choosing, of course, such portions as most sharply contrasted the then with the now. When the article was done, the editor singled out one extract with the remark, "That cannot be published." "Why not?" said I. "We should be in trouble at once," replied he: "Skull and Bones would think it was meant as a direct insult to them." The offending extract happened to contain the innocent phrase "dead men's bones" in such connection that only a hyperæsthetic vanity could have discerned a covert allusion. Yet it had to be suppressed. A lady, conversant with the circumstances, is my authority for the following. An acquaintance of hers was visiting in New Haven. At the friend's where she was stopping there called a member of "Scroll and Key." During the evening the young lady was asked to sing. Seating herself at the piano she innocently began "Gaily the troubadour," when to her astonishment she saw the gentlemanly (!) senior turn on his heel and make for the door without even the formality of an "Excuse me."

While we may laugh at the conceit that seeks to throw a quasi-sacred halo about social clubs of half-grown youths, by tabuing every word or phrase that the supersensitive self-consciousness of the adolescent devotee can by any possibility twist into an allusion to the pin he so conspicuously displays upon his necktie, there is a serious side to it as well. It was notorious ten years ago, that while the ostensible basis of election to "Bones" was scholarship, members were but too apt to choose as their successors those who had been their "heelers" in the contests of "college politics," making that which is from the first held up to the student as one of the highest college honors the reward not of merit, but of trickery. The letters you have published would seem to indicate that such an impression still obtains among the students. How far this four years' practical training in the "spoils system" has influenced the position of Yale alumni in national and State politics, would be an interesting field for inquiry: but no one who has carefully watched its effects can doubt that it lowers the tone of college morality and college honor. It is for this reason that, though my personal memories of New Haven are pleasant, and though I have influenced more than one to attend the post-graduate courses of the University, I have uniformly, when consulted, advised parents *not* to send their sons to Yale for their college course.

Very respectfully yours,

L. B. TUCKERMAN.

CLEVELAND, O., Nov. 26, 1883.

TO THE EDITOR OF THE NATION:

SIR: The letter of "Harvard Graduate," in No. 961 of the *Nation*, seems quite to overlook the essential difference between the society systems of Harvard and Yale. At the latter college only thirty men out of each class—that is, about one-fifth—are admitted into the societies in which membership is so highly prized. At Harvard, about a hundred and forty men, or two-thirds of the class, find a place in one of the three mutually exclusive societies. There is doubtless toadying here, as in other parts of the civilized world; but there is no abject servility toward a few men in the senior class, for the simple reason that the societies are too large for any control of the elections of new members by a knot or clique.

As for "secret societies," in the sense in which that term is usually applied in American colleges, they have never taken root here. There are at present three "Greek-letter societies," of which one has never had a close connection with the fraternity, one is literary, and one is moribund.

H.

CAMBRIDGE, Dec. 3, 1883.

THE DISCIPLINE OF SCIENCE STUDY.

TO THE EDITOR OF THE NATION:

SIR: Allow me a word in reference to Mr. Frederick G. Bromberg's article in the issue of Nov. 15, upon the "Study of Greek." With the writer's main proposition that the true end of all culture is to "teach the future man to think," I am entirely in accord (indeed, I hold all teaching that falls below this to be not alone fruitless, but vicious); but in the demonstration of this proposition there are two points which seem to me open to criticism.

I presume I believe as fully as Mr. Bromberg in the study of language for discipline or utility; but that science cannot and does not, under proper conditions, subserve "the true end of all culture," I believe to be a mistake. "No one can do original thinking in any department of science who is incapable of making original investigations therein. Original investigations cannot be made by children." Of course no child can, at a single bound, rival the masters

in science, but every child is placed, with reference to any science, where the most brilliant investigator started—at the beginning. To make my meaning clear: A flower is given to the child. He knows nothing about it; he dissects it, noting everything that comes under his observation; with each repetition of the process new discoveries are made; and finally the child knows one plant, not from having read a description of it in some text-book, but from actual contact with it, through his senses. Or, in a similar way, he may make a study of the corresponding parts of different plants, as stem, leaf, petal, stamen, etc.

A child thus taught is an original investigator. He may not add at all to the world's knowledge of plant life, but, for himself and for the development of his own mind, he is as much an original investigator as the most profound student of modern botany. To be sure, he will make mistakes, and often fail utterly to grasp the meaning of his subject; but we have seen Virgil and Homer most horribly mutilated at the hands of classical aspirants. If, now, he be required to express his ideas of what he has learned "in appropriate language of his own," is he not taught "both to think and to express his thoughts in words"? What is true of botany is still more true of other departments of science; especially may the elements of physics and chemistry be so presented that the pupil is constantly an original investigator.

That science has not in the past held the place it deserves as a disciplinary study, and does not now hold that place, is because of the manner in which it has been presented. Lay aside all text-book cramming, and let the young pupil learn the great facts of science from a natural and objective point of view, and we shall hear of great minds whose diet has been science. If the young mind needs concrete objects for its contemplation, where will it the more readily find them—in nature ever calling for investigation, or in the ὁ, ἡ, τό of a Greek grammar? And whether it will be more helpful for the practical man, in his every-day life, to be familiar with the great laws of the world around and above, or with the proper accentuation of Patroclus, seems apparent.

For those sciences which are more strictly mathematical, Mr. Bromberg would substitute language because they are too abstract and demand only "a very limited vocabulary and the use of very bald sentences." On these very grounds I would defend the study of mathematics. No one can lay any claim to a disciplined mind who has not acquired the power of abstract thought. Like the power of original investigation, this does not come at a single step; it is a long process and the result of years of toil; the child can and should make a beginning. Though the vocabulary of mathematics is limited, it is exact; and for this reason mathematics is invaluable for the young student. Nothing has more constantly to be checked than looseness in thought and expression. For developing clearness of thought, closeness of reasoning, and conciseness of expression, there is nothing like the cold logic of mathematics.

In thus arguing for science as a disciplinary study, I do not mean to decry language, ancient or modern. The fully-developed men will have both. I only claim for science due recognition. We can ill afford to sacrifice either; surely we ought not to sacrifice the living facts of science for a smattering of a dead language.

FAIR PLAY.

Notes.

D. APPLETON & Co. will publish shortly 'An Illustrated Guide to Mexico, for Tourists, Settlers, and Invalids,' by Alfred R. Conkling; 'Anecdotes of the Civil War,' by Maj. Gen. E. D. Townsend; 'English Lyrics,' in the Parchment Series; 'The City of Success, and Other Poems,' by Henry Abbey; 'The Organs of Speech,' by George Hermann von Meyer; and 'Body and Will,' by Henry Maudsley, M.D.

Prof. Herbert Tuttle's 'History of Prussia to the Accession of Frederick the Great'; 'Characteristics,' by A. P. Russell; 'Excursions of an Evolutionist,' by John Fiske; 'A Roundabout Journey,' by Charles Dudley Warner; and 'Tennyson's "In Memoriam," A Study,' by John F. Genung, are among the immediate publications of Houghton, Mifflin & Co.

The same firm have just issued a lithographic life-size portrait, uniform with their *Atlantic* series, of Nathaniel Hawthorne, drawn by Mr. J. E. Baker, after an English photograph. The expression is remarkably animated, free from anything morbid or sombre, and so in marked contrast to the better-known likenesses of later date. Mr. Hawthorne's family are more than pleased with this reproduction, and we have little doubt that the public will show a similar partiality for it.

Thomas Whittaker will shortly publish 'Doctrine and Duty, or Notes on the Church,' twenty-five sermons by the Rev. Geo. F. Cushman, D.D.

'Times of Charles XII.,' the third volume of Topelius's "Surgeon's Stories," is about being published by Jansen, McClurg & Co., Chicago.

The November *Bibliographer* (J. W. Bouton) announces that the first part of the Philological Society's English Dictionary will soon make its appearance, containing A—Ant, and covering 352 pages.

The American Institute of Instruction offers a prize of $60 for the best essay, without regard to length, on "The New Education: its Origin, History, Principles, Methods, and Results." Essays must be sent to the Secretary, Mr. Thomas B. Stockwell, Providence, R. I., on or before April 1, 1884. The vagueness and vastness of the subject, and the smallness of the premium (which is also the purchase money of the favored MS.), do not promise great results.

James R. Osgood & Co. have issued in an attractive shape the letters of Abelard and Heloise, with an introduction by Mrs Abby Sage Richardson. She narrates the familiar story forcibly, but with so little knowledge of anything but the bare facts as to be superficial and misleading. The letters are given in an English version of the last century. A new translation is needful if the reader of to-day is to understand their pathos and power. It is not that St. Benedict would not be recognized as St. Bennet, nor that *preposterous*, used literally, is now absurd; but that what was thought needful polish a hundred years ago seems only to weaken thought and feeling to a generation that prefers the vigorous directness of the Latin.

It is hard to understand why the late Prof. Amos Dean's little compendium, 'The British Constitution' (Townsend MacCoun), should be given to the public, apparently without revision, nearly twenty years after its author's death. The observations of a lawyer of high standing upon the legal features of the English Constitution will not readily lose their value, and there are many paragraphs here which we can read with pleasure and instruction; but the inadequacy of the historical part will be seen at once when it is noticed that neither Stubbs, Freeman, May, nor Bagehot, nor, we think, Hallam, is referred to as an authority. The need of revision is further shown by the presence of such slips as (p. 70) making Charles II. brother of Charles I., and (p. 73) making the Electress Sophia daughter of James I.

Recent French translations of two American books deserve record. One is Col. Higginson's 'Life in a Black Regiment,' which appears as 'Vie Militaire dans un régiment noir' (Paris: Fischbacher: New York: F. W. Christern). The translation is the work of Mme. la Comtesse Agénor de Gasparin, who had previously rendered into French Mr. Frederick Douglass's autobiography. The other is Mark Twain's 'The Prince and the Pauper,' which appears among the first half dozen of a new "Collection des chefs-d'œuvre des littératures étrangères" (Paris: H. Oudin et Cie.; New York: F. W. Christern). It is called 'Le Prince et le Pauvre.

The great French publishing house of Firmin-Didot & Cie., having completed their magnificent edition of Sir Walter Scott's novels with new and plentiful illustrations, have now begun a companion edition of Fenimore Cooper. The first volume, 'Le Dernier des Mohicans,' is to be illustrated by M. Andriolli, and will appear at once (New York: F. W. Christern). This is additional evidence, were any needed, of the very high place Cooper has always held in the estimation of Continental critics.

The veteran French abolitionist, Victor Schœlcher, has given to the National Library his large and extremely valuable collection of anti-slavery works, containing many rarities, and in addition his collection of works relating to the *Coup d'État* formed during his exile. The former, says *Le Livre*, is unique of its kind.

A new evidence of the rapid differentiation of science in our day is afforded by the announcement from Germany that the firm of Cotta proposes to publish a magazine to be devoted exclusively to the scientific treatment of financial questions. The new periodical is to be called *Das Finanzarchiv*. The editor-in-chief is Professor Schanz, of the University of Würzburg, and among his assistant editors we notice the name of Dr. E. J. James, Professor of Finance and Administration in the University of Pennsylvania.

— *Harper's* and the *Century* always make a special effort in December, and their Christmas numbers this year are certainly very good. The race is pretty even, but the *Century* still gives evidence of being a little ahead, with *Harper's* pressing it close. With these two for favorites, and no field—for the other magazines can hardly be said to encroach upon their domain at all—the result will be watched with interest, no matter what it may be. Charles Reade is writing short stories for *Harper's*. Howells contributes a play ("The Register, a Comedy"); William Black some, "Gossip about the West Highlanders." Mr. Reade is unfortunately out of fashion. There was a time when the announcement of short stories from him would have been a great literary event, and we hardly know why it is that those he is now writing attract so little notice. They are very much the same as what he used to write when 'Peg Woffington' and 'Christie Johnstone' were thought to be among the prettiest tales in the language; but they are not the same, because we have changed ourselves. We ask for more analysis and subtlety, and Reade seems hardly any longer a contemporary. He has actually become in his own lifetime a survival. Mr. Black tells some curious stories about the West Highlanders, whom he knows very well. To Americans all Scotch are alike, and rarely known at all except through the caricatures of *Punch*. But the Scotchman whom the Englishman ridicules is usually the

Lowlander, and the Highlander is a very different creature—more amiable, childlike, and primitive—a clansman and a Celt. The illustrated articles this month are exceptionally good.

—The *Century* has the effect of greater luxury in the editing than any of the rival magazines. Without undertaking to express a technical opinion as to its illustrations, or other details, it is certainly safe to say that the wayfaring magazine reader feels as if its subscribers must be marching along in the foremost files of time, so far as magazine literature is concerned. The object of an illustrated magazine is chiefly entertainment, and entertaining the *Century* always is. Its frontispiece this month is a striking picture of the late Peter Cooper, reinforced by some "recollections," by Susan N. Carter, who dwells with perhaps needless iteration on his benevolence—a quality which, in a philanthropist, may to a certain extent be taken for granted. Literature is represented chiefly by the concluding instalment of Mr. James's clever "Impressions of a Cousin," a sketch of life in New York which shows his usual ingenuity. It contains an excellent picture of a familiar New York character—the defaulting trustee—accompanied by another of a much more uncommon type, namely, the good brother who saves the defaulting trustee from ruin and exposure by the sacrifice of his own property. Mr. Robert Grant has added himself to the lengthening list of American novelists (his "Frivolous Girl" could hardly be called a novel), contributing the opening chapters of "An Average Man." It would be worth the while of some one with a fondness for statistics to make out a list of American novelists. It is hard to recall any large number of the younger generation of literary men—or women—who are not writing a serial. The capacity to write a novel of some sort seems to be very widely distributed, but, of course, this makes it all the more difficult to attain eminent success in it. The production of plays is a matter of far greater difficulty.

—In the December *Atlantic*, Mr. R. G. White discusses "Some Alleged Americanisms" in an entertaining manner. The subject is an old one with him, and the view which he holds with regard to it has become, partly through his efforts, a very generally accepted one. Nevertheless, we think we may point out an aspect of the matter which he now and then overlooks, and which accounts for the curious fact that English people of education continually talk and write about "Americanisms" which Americans declare to be nothing more nor less than English. "To stamp a word or a phrase as an Americanism, it is necessary to show that (1) it is of so-called 'American' origin—that is, that it first came into use in the United States of North America; or that (2) it has been adopted in those States from some language other than English, or has been kept in use there while it has wholly passed out of use in England"—points which, as Mr. White says, are very difficult of sufficient proof. But in a multitude of cases, unless we are greatly mistaken, English writers, when they talk about Americanisms, mean something different from all of this. For instance, he refers to an English critical review of high standing, which, in discussing Walt Whitman's prose, speaks of "scooted" and "out of kilter" as "American slang." Now "scoot" and "kilter" he shows to be English words, or provincialisms; consequently, he says, they cannot properly be regarded as American slang. Notwithstanding which, we venture to assert that if Mr. White were wandering in far Cathay, or on the banks of the White Nile, and should there fall in with a total stranger, who should suggest that as things in that part of the world were rather out of kilter' they had both better just scoot, he would, without hesitation, pronounce his new acquaintance an American. What would make him so sure? Because he would expect from a casual English acquaintance phrases entirely different. Without going into the matter too minutely or curiously, Mr. White seems to overlook, at times, the fact that a mere difference in use may give a word or phrase, for the time being, a sufficiently distinct American character to justify its being called an Americanism, or at any rate to prevent the calling it an Americanism being such utter folly as it seems to him. When we talk about the current use of language, we certainly get upon very debatable ground. Another striking article is an account by Mr. Emerson of Mary Moody Emerson, his aunt, and her religious eccentricities.

—"Doctor and Count Mattei" is the title of an article in *Lippincott's* by Marie L. Thompson, on the great Bolognese "electro-homœopath," Count Cesare Mattei, and incidentally on the trade of the old-fashioned charlatan, as it is still plied in Italy. The Count, it should be understood, is the originator of a system of medicine which is something quite different from medicine as ordinarily practised by any known school. The principle of electro-homœopathy (which should not be confounded with that of homœopathy) was, it seems, discovered twenty years ago by him, but, as so often happens, most of the people who have occupied themselves with it, instead of being willing to see that it is "the greatest boon which God has yet sent upon earth," and consequently ought to have been "widely diffused by all who had the sentiment of duty and honor," have simply looked into it "for the purpose of falsifying it." This makes it the less surprising that, as the Count's 'Guide Pratique' says, all the books hitherto written on electro-homœopathy have been written in ignorance. The simple fact is that the Count's medicines, manufactured by himself, and which he declares have hitherto "defied analysis," restore a patient to health by "renewing the normal action of the diseased organs." This certainly seems to be what medicine ought to do, but then it must not be forgetten that in treating a sick person with electro-homœopathic remedies it is necessary to know whether he is of a sanguine, or lymphatic, or "mixed" temperament. The reason that the medicines have defied analysis is that the Count has never revealed the secret of their composition; and it is hardly necessary to say that the story that "certain medicinal herbs, or the essences of such herbs, form the base of the Mattei globules and liquids, essences which act upon the system like morphine, strychnine, etc.," is a malicious slander got up by rival physicians and druggists. Altogether, electro-homœopathy promises well for those who know how to make use of the new science.

—The November circular of the Johns Hopkins University has just appeared. The number of students is 233, an increase of twenty-nine over last year. It is worthy of note that for the last five years the increase has been almost entirely among the graduate students. They number at present 148, more than half the entire body of students—a fact which has, as a matter of course, a strong effect upon the tone of University life. Among the States represented, Massachusetts shows its usual avidity for learning; not content with its own colleges, it sends, after Maryland, the third largest number of students to Baltimore. No other college, probably, gives a student so large a portion of an instructor: the catalogue shows that there are only five and a half men to each member of the academic staff. The principal accession to the corps of instructors this year is Dr. Paul Haupt, formerly professor of Assyriology in the University of Göttingen. He has organized classes in Hebrew, Arabic, Assyrian, Ethiopic, and Sumero-Accadian. Among the losses, actual and possible, are Dr. Sedgwick, associate in biology, who has gone to the Massachusetts Institute of Technology, and Dr. Hastings, who has just received the appointment to the chair of physics in the Sheffield Scientific School. The circular gives official information of the resignation of Professor Sylvester, who has held the chair of mathematics from the opening of the University, and who has been a chief element of its fame. His lectures during the present half year are on Multiple Algebra, a subject which is almost entirely his own creation, and in regard to which he says: "To me it seems that this vast new science of multiple quantity soars as high above ordinary or quaternion algebra as the 'Mécanique Céleste' above the 'Dynamics of a Particle' or a pair of particles." The students of the University and a small portion of the general public have had this year the rare privilege of listening to a short course of informal but most eloquent and impressive lectures on history and politics by Professor von Holst; and more recently have enjoyed the no less enviable opportunity of hearing Professor Bryce on Roman Legal History.

—Mr. D D. Lloyd, the Washington correspondent of the *Tribune*, has written or, it would be more correct to say, compiled a play, which was first produced last week in that city. With the exception of the leading character, the parts are the stereotyped figures with which many generations have been more or less amused; the scenes consist of the most threadbare of situations and the clumsiest of stage contrivances; the dialogue is hardly more connected, or original, or artistic than the anecdote column of a country weekly—that of one scene, in fact, being bodily lifted from one of Mark Twain's 'Sketches,' while another is boldly borrowed from "In Paradise." To complete the defects of the play, as presented, the acting, with the exception of the leading part, was uniformly bad—not merely crude and awkward, but often coarse. In spite of all this the play seems to be a success: the theatre is filled, the President honors it by attending it, members of the Cabinet and "retired statesmen" like Mr. Blaine sit through it with, apparently, great enjoyment. It is true, doubtless, that had not the part of "*General*" *Limber*, the politician, been acted by J. T. Raymond, no one would have gone to see it, but even a first-rate actor cannot make a success of a play unless it has something which appeals to popular sympathy. To this sympathy was primarily due the success of the same actor's *Colonel Sellers*; but "The Gilded Age" was not only a far better play, from both a literary and a theatrical point of view, but there was much originality and attractiveness in the Colonel's character as a person, aside from his representing the type of optimistic speculator, which we are all said to be in embryo, and in which we naturally take a hearty interest. But not even Mr. Raymond can give a personal interest to the hero of "For Congress," who is a mere bundle of attributes—the "stock Congressman of the writers of fiction," minus the interest which belongs to the latter as one of several characters who collectively work out the story. He is a mere country politician of the lowest rank, the puller of the most obvious and familiar wires, the mouthpiece of the most hackneyed noble sentiments, familiarity with which, as political devices, has destroyed in him even the consciousness of their incongruity. His cynicism, indeed, is so open as to be without humor

while the best touch of nature in *Colonel Sellers* was his childlike confidence not only in himself, but in his schemes.

—It is, therefore, sympathy of a different kind which connects actor and audience in "For Congress." It is not to what they are, but merely to what they have seen or heard, that the actor's successful appeal is made. We might dwell upon the moral, implied in this statement, that politics must indeed be in a bad way when good-natured contempt for the political class is so universal as to make such representations acceptable. We prefer to remark upon their picturesqueness, without which mere truthfulness would fall far short of success. The politician (in the East, at least) is far more familiar than the speculator, and, judged by the standard of the plays and novels commonly presented to us, he is as original as the red Indian ever was. Mr. Henry James has told us that the difficulties, usually insuperable, of the American novelist are owing to the absence of social distinctions, without which are impossible light and shade. Mere wealth does not appeal to the imagination, and is therefore useless to the novelist. But the politicians form a "class" whose literary merits are only beginning to be appreciated. Though their eminence is usually self-created, it is undisputed, and the feeling of the public with regard to them is, not like, certainly, but perhaps analogous to, that felt by the European middle class for those of whose nominal superiority they are at once conscious and resentful.

—The *Deutsche Rundschau* for the present month begins the publication of "Ivan Turgeneff's Recollections of Life and Literature." Those to whom French is easier reading will derive much gratification from two articles in the November *Livre*—"Ivan Tourguéneff raconté par lui-même," by Michael Ashkinasi, and a further discourse about the same genius, apparently (to judge by the initials) from the same pen, under the rubric of Foreign Correspondence. In the latter so-called "biographical study" we are treated to an almost entire translation of the appreciative and discerning estimate passed by Bielinski on the rising novelist in 1848. One sentence from this critique is as follows: "The principal trait of his talent is his inability to create a character that he has not met with in real life." Turgeneff himself confirms this in a sentence quoted by Mr. Ashkinasi from his 'Recollections': "I must confess that I have never tried to create a character unless based, not on an idea, but upon a living person"—for example, Basarof in 'Fathers and Sons.' Bielinski did not overlook, either, "the art with which Turgeneff paints the scenery of our country. He has an artist's love of nature, depicting it not exclusively in its poetic aspects, but just as he sees it. His paintings are always truthful, and you will always recognize our dear Russian nature." Ashkinasi, reminding us that Turgeneff was a man of gradation, not of revolution, hazards the conjecture that some posthumous work may be discovered, in which it will appear that he *could* paint the "veritable Russian revolutionist" of to-day, though he avoided doing so during his lifetime. His descriptions of the personal appearance of Pushkin and Gogol, his experience with the censorship—one K. changing the phrase "This young girl was a flower" into "This young lady resembled a splendid rose"—his love affair with a young English woman, broken off by a nameless "accident très-vulgaire et très-grotesque" in a boat excursion on an Italian lake, his indignation at Russian Jew-baiting, his resentment against foreign traducers of his native land—such are some of the topics touched upon more or less fully by his admirer. Add to all this a most interesting etched portrait of the sad-eyed author of 'Virgin Soil.'

—Some forty years ago, Johanna Schopenhauer, mother of the philosopher, published the charming reminiscences of her youth which, gracefully abridged by Mrs. Austin, formed the most interesting chapter of her volume on 'German Society.' The time and scene of the reminiscences are the last quarter of the 18th century in Danzig—then as picturesque socially as it was (and is) architecturally. One of the incidents related by Mrs. Schopenhauer is how, as a little girl, she was one day playing in the house of an old lady, Mrs. Chodowiecki by name, when a great disturbance arose, caused by the sudden arrival of the old lady's only son. The boy had left Danzig thirty years before, with nothing in his pocket but his talents, and not much hope of turning these to advantage. But fortune favored him, and he became a prosperous portrait-painter and book-illustrator. In 1773, he made the above-mentioned visit to his mother, during which he kept, both with pen and pencil, a daily record of all that happened within his vision. At his death, his sketch-book passed into the possession of the Berlin Academy, from whose archives it was recently disinterred by the director of the institution. Chodowiecki sketched everything, beginning with the farewell to his family; and his sketch-book, as published, is said to be unique in its faithful portraiture of manners and customs. Pictures of ostensibly the same character were previously known, but they occur chiefly as illustrations of the absurdly artificial and conventional fictions of the time, the illustrations of which, had they depicted real life, would not only have burlesqued the text, but would have shocked the sensibilities of the romantic readers of the day as much as Trollope's realism shocks Mr. Julian Hawthorne. Historically, the sketches are more valuable than works of genius, such as Hogarth's, since no *arrière-pensée* is involved in them—no intention to point a moral or adorn a tale.

—The sixteenth volume of the Encyclopædia Britannica (Little, Brown & Co.) is preëminently devoted to scientific and technical subjects. The articles "Mineralogy," by Professor Heddle, "Meteorology," by A. Buchan and Balfour Stewart, and "Mollusca," by Ray Lankester, are, in reality, extensive books. Next to these must be mentioned "Mensuration" (Professor Thomson), "Metallurgy" (Dittmar), "Micrometer" (Dr. Gill), "Microscope" (Dr. Carpenter), "Mining," "Mint," "Molecule," and "Morphology." Some of these treatises are richly illustrated. The most conspicuous contributions to philosophy, theology, and Biblical science are by Professor Caird ("Metaphysics," a very extensive treatise), Rev. Dr. Rigg ("Methodism"), Dr. Harnack ("Millennium"), Prof. Robertson Smith ("Messiah," "Micah," etc.), Rev. Dr. Littledale ("Monachism"), and Wellhausen ("Moab," "Moses"). The last-named also contributes an essay on Mohammed, while one of his few rivals as a Biblical and Oriental critic, Nöldeke, treats of the Koran and the Moallakat. Schiller-Szinessy's articles on the Mishnah and Midrash are crammed full of bibliographical details and lexicographical remarks, and, therefore, almost unreadable. Wellhausen's "Moses" contains some interesting special points, but appears to us inadequate even as a supplement to his great article "Israel." Nor is "Moab" full enough, considering that there is no separate notice of Mesha (and his stone). That there is no entry whatever under the latter name is characteristic of the peculiar economy of this Encyclopædia, which in the present volume also omits to furnish any reference or statement to readers who look for information on Miriam, Messalina, or Miaulis; on the island or the Venus of Milo; or on any of the sultans called Mohammed. The sultans will, of course, in due time easily be discovered under "Ottoman Empire" or "Turkey," though undoubtedly not with the necessary biographical particulars, as distinguished from the historical; but Miriam is mentioned neither under "Moses" nor under "Israel," Miaulis is barely alluded to under "Greece," and why is the average reader presupposed to know that Messalina was the wife of the Emperor Claudius, in the notice of whom he may read about her, or that the island of Milo is described under "Melos"? That Mendizabal, Messala, and Mittermaier do not appear among the biographical notices, nor Meudon, Michoacan, and Minho among the geographical, is, perhaps, less surprising. Among the more interesting lives are those of Mencius (by Professor Legge), Felix Mendelssohn, Metternich, Michelangelo (Colvin), John Stuart Mill (Minto), Milton (Masson, 18 pages), and Montesquieu (Saintsbury). Of the articles combining description and history the most important are: "Mesopotamia" (by Socin), "Mexico," "Mougols," "Montenegro," and "Morocco." In all these the more recent history is defective. The late history of Mexico is especially remarkable for its skeleton-like meagreness. The invasion of 1861 and the war of the following six years are told in ten lines, in which there is no mention of Forey or Bazaine, Diaz or Escobedo, Miramon or Zuloaga, or of the siege of Puebla. The geography of the United States is represented by descriptions and very handsome maps of Michigan, Minnesota, Mississippi, and Missouri. The most valuable maps in this volume are those of Mexico and Morocco.

SEELEY'S EXPANSION OF ENGLAND.

The Expansion of England. Two courses of lectures by J. R. Seeley, M.A., Regius Professor of Modern History in the University of Cambridge. London: Macmillan & Co.; Boston: Roberts Bros. 1883.

THIS singularly thoughtful and suggestive book abundantly accounts for the interest in historical inquiry which the author has succeeded in kindling among the students of the University at which he lectures upon Modern History. His resolve, indeed, to be independent, to look at history exclusively from his own point of view, is, perhaps, pushed to excess. It causes him to be a little too disdainful of the labors of his predecessors in the same field, and in the result he seems to us to do less than justice to their manner and method of writing history, and, perhaps, to exaggerate the importance of the new views set forth in the volume before us. At the same time there can be no question that their importance is great; that by means of these lectures a novel light is thrown upon the tangled records of English history during the eighteenth century.

The title of the book explains its object. It sketches the enormous territorial expansion of England during the eighteenth century. Having regard to this expansion, Professor Seeley is of opinion that the interest of English history ought to "deepen steadily to the close," but actually, as it has hitherto been written, the reverse of this is the case. "English history, as it is popularly related, not only has no distinct end, but leaves off in such a gradual manner, growing feebler and feebler, duller and duller, towards the close, that one might suppose that England, instead of steadily gaining in

strength, had been for a century or two dying of mere old age." The eighteenth century, beyond all others, has left only

"a faint and confused impression upon the national memory. In a great part of it we see nothing but stagnation. The wars seem to lead to nothing, and we do not perceive the working of any new political ideas. That time seems to have created little, so that we can only think of it as prosperous, but not as memorable. . . . But what we chiefly miss is unity. In France, the corresponding period has just as little greatness, but it has unity; it is intelligible; we can describe it in one word as the age of the approach of the Revolution. But what is the English eighteenth century, and what has come of it?"

The cause of this lack of interest and unity Professor Seeley finds in what he considers a radically false conception of the manner in which history ought to be written. Historians treating of the eighteenth century, for example, have devoted themselves almost exclusively to the task of reproducing the age, and the men and women who lived in it, and the events which happened, precisely as the newspapers of the day looked at and wrote about them. The consequence has been that Parliamentary wrangles, the fall of one ministry, the taking of office by another, and other trifles of this kind have been thrust into the foreground of the picture which ought to be occupied by the story of "The Expansion of England." This expansion, Professor Seeley complains, has barely been regarded as belonging to the history of England properly so called. "Colonial affairs and Indian affairs are usually pushed a little on one side by historians. They are relegated to supplementary chapters. It seems to be assumed that affairs which are remote from England cannot deserve a leading place in a history of England, as if the England of which histories are written were the island so called, and not the political union, named after the island, which is quite capable of expanding so as to cover half the globe." The consequence is that the one fact of transcendant importance—namely, the expansion of England—which all through the eighteenth century was steadily growing to completion, being omitted from the main record of events as without any special significance, what remains to be told is merely details, chronologically arranged, but having no other principle of cohesion.

This expansion took the shape of a struggle between England and France for the mastery in the New World and in India. "The New World, in the seventeenth and eighteenth centuries, does not lie outside Europe, but exists inside it as a principle of unlimited political change. Instead of being an isolated region in which history is not yet interested, it is a present influence of the utmost importance, to which the historian must be continually alive; an influence which, for a long time, rivalled the Reformation, and from the beginning of the eighteenth century surpassed the Reformation in its effect upon the politics of the European states." So, also, was it in India. The trade rivalries of French and English mercantile companies steadily grew in magnitude and importance until they became a contest in which the two nations became involved as principals, and "probably the great Mahratta war of 1803 seemed to Lord Wellesley to be a part of the war with France; and probably Arthur Wellesley believed that at Assaye and Argaum he struck at the same enemy as afterwards at Salamanca and Waterloo."

The singular indifference to the expansion of England, on the part both of historians and the nation at large, Mr. Seeley attributes to a misunderstanding of the cause which led to the revolt and independence of the United States. This cause is supposed to be involved, so to speak, in the very nature of a distant dependency, and certain, therefore, to operate at some time or other. Sooner or later, this or that English colony will pass from the age of infancy to that of manhood, and as soon as it feels itself capable of standing alone, it will declare itself independent of the parent state. Colonies are not, therefore, an integral part of the British state or the British nation. They are only attached to it for so long as such attachment is convenient and profitable to themselves. Against this conception of the colonial relation Professor Seeley protests with much emphasis. He brands those who hold it as "pessimists." He considers that it is based upon a mistaken analogy, and that the experience of the modern world demonstrates that a vast empire is under no inherent necessity to fall to pieces simply because it is immensely large. It was the old "colonial system" which drove the American colonies into revolt, and, that system having now disappeared, there is no reason to suppose that the colonies which England possesses at present will be driven to act upon that precedent. On the other hand, the existence of the United States and the Russian Empire demonstrates that the problem which the "pessimists" say can be solved only in one way has practically been solved in the opposite way. Here we have two instances of indefinite territorial expansion without loss of unity and cohesion.

"It is curious," writes Professor Seeley, "that the pessimists among ourselves should generally have been admirers of the United States, and yet there we have the most striking example of confident and successful expansion. Those colonists which, when they parted from us, did but fringe the Atlantic sea-board, and had but lately begun to push their settlements into the valley of the Onio, how steadily, how boundlessly, and with what steadfast self-reliance have they advanced since! They have covered with their States or Territories, first the mighty Mississippi Valley, next the Rocky Mountains, and lastly the Pacific Coast. They have made no difficulty of absorbing all this territory; it has not shaken their political system. And yet they have never said, as among us even those who are not pessimists say of the colonies, that if they wish to secede, of course they can do so. On the contrary, they have firmly denied this right, and to maintain the unity of their vast state have sacrificed blood and treasure in unexampled profusion. They firmly refused to allow their Union to be broken up, or to listen to the argument that a state is none the better for being very large."

The Russian Empire also is held up for the confusion and refutation of the "pessimist."

"As soon as it is proved by the examples of the United States and Russia that political union over vast areas has begun to be possible, so soon Greater Britain starts up not only a reality, but a robust reality. It will belong to the stronger class of political unions. If it will not be stronger than the United States, we may say with confidence that it will be far stronger than the great conglomeration of Slavs, Germans, Turcomans, and Armenians, of Greek Christians, Catholics, Protestants, Mussulmans, and Buddhists, which we call Russia."

Professor Seeley, conscious that the pessimistic manner of regarding distant colonies is due largely to a bad habit, conjures his countrymen to abandon this bad habit for a most excellent way. Emigration on any large scale to the colonies is frequently deprecated on the ground that England would thereby be "deprived" of the best and hardiest part of its population, whereas their colonies ought to be regarded by all good and patriotic Englishmen as "simple extensions of the English state and nation over new territory." There is no fear, so long as they are not exploited for the selfish advantage of the parent state, that the colonies will, of their own motion, cut themselves adrift.

"The emigrant who goes out merely to make his fortune may possibly in time forget his native land; but he is not likely to do so. Absence endears it to him, distance idealizes it; he desires to return to it when his money is made; he would gladly be buried in it. There is scarcely more than one thing that can break this spell, and that is religion. Religion, indeed, may turn emigration into exodus. Those who leave Troy carrying their gods with them can resist, no doubt, the yearning that draws them back; they can build with confidence their Lavinium or their Alba, or even their Rome, in the new territory unhallowed before. For I always hold that religion is the great state-building principle. These colonists could create a new state because they were already a church, since the church (so at least I hold) is the soul of the state. Where there is a church a state grows up in time; but if you find a state which is not also in some sense a church, you find a state which is not long for this world. . . . But what is to be found similar to this in our present colonies? They have not sprung out of any religious exodus. Their founders carried no gods with them. On the contrary, they go out into the wilderness of mere materialism, into territories where as yet there is nothing consecrated, nothing ideal. Where can their gods be but at home? If they, in such circumstances, can find within them the courage to stand out as state-builders, if they can have the heart to sever themselves from English history, from all traditions and memories of the island where their fathers lived for a thousand years, it will indeed be necessary to think that England is a name which possesses sadly little attractive power."

This is written in truly choice and felicitous English; it is a pleasure to read, and it lingers in the memory like a strain of delightful music. But it betrays a curious confusion of thought. It identifies the capacity to found an independent state with the desire to attempt it. The American colonies did not revolt because they had gone out from the parent state carrying their gods with them, but because the English Parliament insisted upon taxing them without their consent. And, similarly, if the British colonies of to-day find that their connection with England is either financially burdensome or politically dangerous, they will certainly not be hindered from asserting their independence by the reflection that a state without a church is not long for this world. The very fact that they have gone out into "the wilderness of mere materialism" for the purpose of becoming rich, will aid to make aught which interferes with that purpose altogether intolerable. Apart, however, from this consideration, it strikes us as strange that Professor Seeley should cite either Russia or ourselves as examples of states which have solved the problem of holding together such an empire as that of Great Britain. The Russian Empire, indeed, at the present stage of its existence, cannot be said to have solved any problem of government except, perhaps, the problem of how not to do a thing, and the United States have not been called upon to hold a heterogeneous empire together in the face of that great divider of men, the sea—and how potent an element of division the sea is, is obvious if we compare the relations between England and Ireland with those between England and Scotland.

Professor Seeley attempts to meet this difficulty by saying that modern mechanical inventions have, so to speak, thrown a bridge across the broadest seas, making that close at hand which half a century ago was distant by half the length of the year. But the sea is not a divider in proportion to the number of leagues which separate one country from another, but inasmuch as it, and it alone, creates in the countries thus divided interests and needs which are independent of each other. The United States, notwithstanding their vast extent, are so related to each other geographically that no one of them could be assailed by an enemy without the material interests of all being immediately affected. The circumstances of the British Empire are altogether different. The United Kingdom of

Great Britain and Ireland belongs to a political system towards which the English settlers in Australia, New Zealand, or the Cape stand in no relation. The Indian Empire, again, is exclusively a British interest. Almost the entire foreign policy of Great Britain is regulated by the real or supposed necessities of its Indian Empire. If it should engage in a war with any European Power, it is India that would be the efficient cause of the war. The British colonies would have no voice in either the declaration or the averting of such a war; their own material interests would be in no way concerned in it; but as portions of the British Empire they would, to no inconsiderable extent, be compelled to participate in its dangers and burdens. The mechanical inventions which have bridged the ocean would make such liabilities of a far more menacing character than they bore a century ago. Their commerce would be liable to be swept away by the enemy's cruisers, and their seaports bombarded and pillaged by the enemy's ships of war. It is surely a reasonable conclusion of the pessimist to anticipate that if the choice lie between the endurance of such inconveniences and the setting up in life for themselves, the British colonies will choose the latter alternative.

Professor Seeley shrinks from this prospect because he fears that when she is shorn of her colonies and India, Great Britain will sink to the level of such states as Holland and Spain, whose history is, as it were, wound up, and which have only the memory of a great past to live upon. But to think thus, it seems to us, is to fall into that very mood of pessimism against which he is elsewhere so careful to warn his readers. Spain's history is not wound up because she has lost her American colonies, but because the genius and the energy of her people have been withered under the combined influence of persistent misgovernment and religious superstition. Great Britain nurtures her colonies in to strength, so far as that can be done, by feeding them with emigrants, but she derives no strength in return; and unless her colonies take to maintaining standing armies and iron-clad navies for the purpose of coming to the assistance of the mother country in the hour of her need, it is difficult to see of what service they could ever be to Great Britain. Englishmen hold their own among the nations of the world by reason of their own inherent strength and moral and intellectual capacities, and all these would remain unimpaired if her colonies were simultaneously to repudiate their allegiance to Queen Victoria. To us it certainly appears that Great Britain and her colonies will both benefit greatly when the slender tie which still binds them together is severed. So long as that tie remains, the most populous and flourishing colony will not be able to develop those higher moral qualities which come from the dignity and responsibilities of independence; and Great Britain will herself be burdened with cares, and distracted with fears, which divert her attention from the growing wants of her population at home.

The second course of Professor Seeley's lectures is taken up with an investigation of the causes which led to the growth of British power in India. This investigation is remarkable for the same freshness of view and independence of judgment which are to be found in the earlier course, but also, it appears to us, for a curious unwillingness to contemplate the darker aspects of that marvellous history. The truth is that Professor Seeley, notwithstanding his exhortations to study history in a scientific and dispassionate spirit, is himself partially enthralled by a prejudice in favor of large empires. He does not like to think that the day will ever come when the British Empire will extend over a fewer number of square miles than the United States or the Empire of Russia; and, under the influence of this feeling, he has been unconsciously led to emphasize unduly all that tells in favor of unity, and to throw into the background the facts and forces which tell against it.

Scotland in Pagan Times: The Rhind Lectures in Archæology for 1881. By Joseph Anderson, LL.D. Edinburgh: David Douglas. 1883. 8vo, pp. 314, with 265 illustrations.

THIS book, consisting of a series of lectures delivered under the auspices of the Society of Antiquaries of Scotland, is the second instalment in a course of prehistoric research of which 'Scotland in Early Christian Times' was the first. Ostensibly it refers to the epoch or phase of civilization that lies between the close of the Bronze Age and the introduction of Christianity, but in point of fact it only covers the latter portion of that time. Roughly speaking, this whole period, so far as Scotland is concerned, may be defined as beginning some two or three hundred years B. C., and reaching down to the ninth or tenth century of our era, though, like all such efforts, this attempt to assign fixed dates to archæological epochs is, necessarily, vague and elastic. In the present instance, however, it is rendered less uncertain by the fact that our author evidently intended to make his definition broad enough to include not only the time of the Roman occupation, but also that of the Vikings, and thus to bring it down to a period long after the Gospel was first preached on Iona. Of course, during much of this time Christian convert and pagan devotee must have lived together in Scotland as contemporaries if not as neighbors, and hence the difficulty of drawing a hard and fast line between their arts and their industries. To obviate this difficulty, our author classifies the relics that have come down to us, according to the burial customs that are supposed to have characterized the two forms of religion—ascribing all those interments that show signs of cremation, or in which are found articles intended either for use or ornament, to a pagan origin; while those in which there are no such deposits of grave goods, or in which the articles found have an evident connection with the new faith, are assumed to belong to the Christian period.

This is, no doubt, a sweeping generalization, in view of the fact that weapons and other insignia of office are still occasionally buried with military and ecclesiastical dignitaries; but under the circumstances it is, perhaps, as satisfactory a basis for classification as any that could have been devised. At all events, it is decisive as to a class of burials containing articles which belong unmistakably to the pagan times of Scandinavia, or which, differing from these in form and ornamentation, are yet possessed of characteristics, or were found under conditions, that can only be referred to the same time and people. So, also, and for the same reason, it is believed to be conclusive as to certain groups of relics, in stone and metal, which "present in their forms and their decorations features which we have learned to recognize as belonging to the school" termed "Celtic," and which is said to have been "the precursor and parent of the greater school of Celtic art of Christian times." Reduced to plain English, these are but other ways of saying that an article, made and used by a people who had never felt the influence of Christian civilization, must have been of pagan origin; and this of course is a truism and decisive so far as it can be made to apply to any given specimen. But while cheerfully conceding this point, we must be permitted to protest against that style of reasoning which is wont to infer a phase of civilization from the form of an implement, a style of ornamentation, or a fashion in decoration. These are stages in the progress of art, and while they must have coexisted, in time and place, with certain conditions of social and of religious development, there is no necessary connection between them, and hence the presence of the one is not, of itself, decisive as to the existence of the other. Indeed, the facilities of intercourse, even between barbaric tribes, are and always must have been so great, the survivals and revivals in art so frequent, as to make it unsafe to say of any style of ornamentation and, *a fortiori*, of any mere fashion in decoration, that it is characteristic of any particular "province," or that it belongs to any particular period, in time or phase, of civilization. For this reason, then, we must decline to follow our author in all that is said upon this point. That a pattern in ornamentation, as, for instance, the zoömorphic, might have originated in Scandinavia, as he (p. 93) intimates, and been transplanted in pagan times to Scotland, where it continued to flourish until it reached its full development in the Christian period, is, of course, very probable; and it is also possible, as these periods were contemporaneous and the provinces conterminous, that the process may, to some extent, have been reversed: but if the terms Scandinavian, and Pagan and Christian or their equivalents, Early and Late Celtic, when applied to art, mean distinct things, as they do when applied to a people or a religion, then it is difficult to understand how one and the same style of ornamentation can be characteristic of all three, or how it is possible to say to which one of them it properly belongs, since it is found under circumstances that lead to the belief that it was common in all.

In dealing with the architectural remains of this period—the lake-dwellings, hill-forts, and earth-houses—our author is more successful; and especially is this true of his treatment of that large class of ruins known under the local name of "brochs," or burghs. Of this group, the burgh of Moussa is the best-known representative, and with this as a type they may be briefly described as circular stone towers of dry-built masonry, enclosing central areas or courts, and with their chambers, stairs, and galleries contained within the thickness of the walls. Though differing thus widely, in interior arrangement and in the method of construction, from the tall, slender lime-built towers that dot the opposite shores of Ireland, they undoubtedly owe their origin to the same cause; and if they do not represent the same phase of religious culture, they belong, chronologically, to the same period. Upon this point there is no room for doubt. The character of the articles, particularly the Samian ware found amid their ruins, shows conclusively that the people who sought shelter in them lived after the time of the Romans; and this circumstance, taken in connection with the fact that, like the towers of "ecclesiastical construction" on the coast opposite, their range is limited to the regions that were most exposed to the piratical attacks of the Vikings, would seem to be decisive as to the time and purpose for which they were built, even without the confirmatory evidence of the sagas.

In justice to our author it must be said that in order to appreciate this work it should be studied in connection with its predecessor, and should be considered, not so much a series of oral lectures as a special treatise upon the particular period to which it refers. Regarded in this light, the details with which it is, at times, too much crowded to suit our American ideas

of what a lecture ought to be, will be seen to have their uses; and the numerous and well-executed plans and engravings, which add so much to the interest and value of the work, will be found to take their proper place in illustrating the arts and architecture of a period which, however interesting, seems to have been but transitional.

A Book of Sibyls: Mrs. Barbauld, Miss Edgeworth, Mrs. Opie, Miss Austen. By Miss Thackeray. Harper & Bros.

THE four sketches which make up 'The Book of Sibyls' are only the more welcome because already known in the pages of the *Cornhill*. The book is beautifully inscribed to Mrs. Oliphant: "Dear Sibyl of our own, . . . as I write your name, I am grateful to know that to mine and me it is not only that of a Sibyl with deep visions, but of a friend to us all." The essays are not mere collections of facts, nor are they meant as literary criticism, but they give what is infinitely more precious than the one, and, in its way, more rare and more exquisite than the other. They seem to catch and to embody for us that subtle something which we name but do not define when we call it charm.

Miss Thackeray, by some gentle witchery, has made real and living for us the grace and the winsomeness that made these ladies so attractive to their own generation, and their memories so delightful to us. Such work is most happily suited to her style, a style which it were needless to praise, were it not that Mr. Trollope's recent criticism will be remembered here. There is, we admit, a carelessness about her style. But there is negligence and negligence, as there are styles and styles. Many are learned from books. They are not necessarily pedantic or stiff, but they have a completeness, a deliberateness, that remains even when a definite form of expression has become second nature. Others are learned from people, or rather developed from an intercourse with wise, bright men and women, that plainly must have been life-long. To this class belongs Miss Thackeray's, and its faults are exactly the faults of conversation—the lapses, the little reversions, the repetitions. A methodical writer like Mr. Trollope cannot forgive such mistakes, but, for all that, the very carelessness gives such a style a grace all its own.

For the sketch of Miss Edgeworth, Miss Thackeray was allowed to quote from a privately-printed volume which appears not to have been known to any of her biographers. It was written by the last Mrs. Edgeworth, for the use of her children, as a record of "a friendship lasting for over fifty years" between Maria and her father's wife. For the others, the chief materials were already familiar, but the rich store of personal recollection and association which Miss Thackeray has to draw upon give vivid reality to the portraits. With her we climb the old high road to Hampstead and walk with Mrs. Barbauld. We sit at the lunch table where all but one, and he a Frenchman, know Maple Grove and Selina. We hear Lady S—— describing her uncle Edgeworth: "If you had known him, you would not have wondered at anything." Miss Thackeray remembers Mrs. Opie—"the straight-cut figure of a Quaker lady standing in the deep window of an old mansion that overlooked the Luxembourg Gardens, with all their perfume and blooming scent of lilac, and sweet echoes of children, while the quiet figure stood looking down on it all. From —— to a child—such an immeasurable distance." From out the lumber-room of that same house came the old brown volume of 'Popular Tales.'

The little anecdotes and allusions that occur on every page are slight and modest enough, but as the eye catches them one after another they suggest what a painter would call a secondary color in the picture. We find that besides the portraits of the four ladies we have much that could make an autobiography of Thackeray's daughter. It begins in childhood, when she lived "in company with a delightful host of little playmates, bright, busy, clever children: . . . simple Susan, lame Jervas, generous Ben"; and ends at that lunch table where, we may be sure, the party was of people who (to borrow her own felicitous phrase) belong to the *agreeable* classes. There is a beautiful suggestion of personal experience in the constant and tender recognition of the peculiar ties that may bind father and daughter. Is it true that a woman of unusual power is likely to be what is called "the father's child"?

There are some bits of critical judgment that are well worth considering. Of Jane Austen: "In her special gift for organization she seems almost unrivalled." Of Miss Edgeworth: "One very distinctive mark of her mind is the honest candor and genuine critical faculty which is hers"; and "a power of versatility, an interest in subjects for their own sakes, not for the sakes of those who are interested in them, was essentially hers." This last, the gift of looking at things impersonally, is, we fear, but rarely possessed by women in general. "The authoresses of that day [the close of the last century] were rather literary women than creators of literature." . . . "This simple discovery, that of reality, was one of the last to be made by women." We close with one comment on character for the sake of the contrast, which is drawn more acutely and more delicately than we have ever seen before, between the two lives possible to a woman: "Her life [Miss Edgeworth's] was now shaped and moulded in its own groove. The consideration, the variety, the difficulties of unmarried life were hers; its agreeable change, its monotony of feeling and of unselfish happiness, compared with the necessary regularity, the more personal felicity, the less liberal interests of the married."

English Style in Public Discourse: With Special Reference to the Usages of the Pulpit. By Austin Phelps, D.D. Charles Scribner's Sons. 1883.

DR. PHELPS prefaces this publication of his Andover lectures on rhetoric with the statement that the chief features of the culture of theological students, when they come from the colleges to the seminary, are "a limited knowledge of English literature, a more limited acquaintance with the philosophy of language, a still more partial familiarity with the English pulpit, etc." He remarks further on "the necessity of a great deal of *elementary* instruction" in this branch, and concludes by saying that his object will be gained if his book has any influence among such students, "to expand their English culture, and diminish the inevitable waste of their early years of professional service by helping them to begin it with a scholarly ideal." This introduction (and no one can speak with greater authority on the subject than does this experienced professor) gives an unfavorable impression of the material out of which the ranks of the clergy are recruited; but it was required in excuse of the exceedingly elementary rules of composition, old as the rhetorical art itself, which make up the substance of the teaching, although they are treated of in a vigorous and thoughtful way, very different from the petty pedagogic style of most manuals. Were this all, however, there would be no need of noticing the volume, which will easily find introduction as an educational work for its special purpose. The secular mind is more interested in the advice which this veteran of the pulpit addresses, at considerable length and without caring where he hits, to the novices in his charge. Not to enter on the matter in detail, he insists on the importance of raising the intellectual standard of sermons, partly as an antidote to the excessive emotional tendencies of Christianity, partly in rivalry of infide brains. He discourages all violence, whether in the form of denouncing vengeance or dogmatizing in speculative theology. He seeks to destroy the sentimental hallucinations that gather about "the sacred calling," and warns the young men that they must take their chances and win respect among educated men and influence over the people, as other gentlemen do, by good sense, good taste, and good manners. In short, the tendency of all that is said is toward more learning, seemliness, and tolerance in the profession. The striking thing in this, the sign of the times, is, that these young men are instructed, on the question of tact—the practical question how to meet a modern audience—that they should adopt an attitude very different from that which was the ideal before the new scepticism came in. Here is the voice of one of the elders within the church, counselling less rigidity, less social confidence, a more secular learning, a milder persuasion, and yet without implying the need of any revision of doctrine unless it be that of original sin. Such a change in the mode of presenting truth by the preacher indicates a much greater difference, already acknowledged, in the way in which truth is held by the disciple; it is a rearrangement, and practically a reform, of the creed itself. Men not unfrequently change their minds without knowing it at the time.

As literary work Dr. Phelps's book deserves a word more. The force he displays in thinking leads him occasionally to boldness in rhetorical statement often happy but sometimes amusing. Dr. Johnson, we fancy, would have been more startled by the following than by "Goldy's" original joke: "In his [Dr. Johnson's] conversation he was an antelope: in his books he was a whale." The author elsewhere calls the venerable Doctor's style that "of a crocodile." He betrays, too, seemingly, a prejudice against Carlyle, Emerson, and other writers of markedly original expression. The color of it is seen in the following curiously-elaborated censure of Lowell for the coining of such words as "other-worldliness": "If an orthodox minister should coin them, the author of the 'Biglow Papers' would be the first to satirize them as tokens of the barbarism of the pulpit. He knows, and the world of scholars knows, that his own scholarly reputation will bear such occasional departures from good English, somewhat as a very saintly man can bear to be seen carrying a flask of brandy in the street." With the exception of this modern liberal class of writers, literary men are sensibly estimated in point of style. We cordially commend the book to its own audience.

Curious Epitaphs. Collected from the Graveyards of Great Britain and Ireland, with Biographical, Genealogical, and Historical Notes. By William Andrews, F.R.H.S. London: Hamilton, Adams & Co. 1883.

To the manifold works which he enumerates in his tentative bibliography of epitaphian literature Mr. Andrews has made a substantial addition. Soldiers and sailors, musicians and actors, parish clerks and sextons, sportsmen, traders, printers, topers, punsters, and what not, all figure in his pages as the subjects of eccentric epitaphs, not a few of which were written by themselves. And odd indeed are many of the things which his researches, at first or at second hand, among the tombs have dragged to light. The

philologist will learn from him, though, possibly, not to his complete conviction, that there stands inscribed on the gravestone of a hawker of fish, at Preston: "Beneath this stone are deposited the remains of Richard Turner, author of the word Teetotal, as applied to abstinence from all intoxicating liquors, who departed this life on the 27th day of October, 1846, aged 56 years." Fragrant to vegetarians (however suggestive to carnivorous, ornithophagous, and other species of human kind, of the odor of frequent cabbage and onions) must be the memory of the sturdy and much enduring martyr regarding whom is to be read, in the churchyard of Uley: "Underneath lies the remains of Roger Rutter, *alias* Rudder, eldest son of John Rutter, of Uley, who was buried August 30, 1771, aged 84 years, having never eaten flesh, fish, or fowl during the course of his long life." "Dump" (as "dumpling" is called in Roger Rutter's native Gloucestersbire) is said to have constituted, in its varieties of "plain dump," "hard dump," with a change to "apple dump" on high days and holidays, the principal food of this man of monotonous diet. In the epitaph on Daniel Lambert, the obese, it is recorded: "He measured 3 feet 1 inch round the leg, 9 feet 4 inches round the body, and weighed 52 stones 11 lbs. (14 lb. to the stone)." The explicitness of the information given in brackets reminds one of the pious widow who, in praying for a competency, was careful to specify that what she intended was "five hundred pounds sterling per annum, in quarterly instalments, to be paid in advance, and without deduction for income-tax." At Sculcoates, Hull, is an epitaph of the last century on Mrs. Jane Delamoth, described as "a poor sinner, but not without holiness," in short-hand. It is supposed to be unique of its kind. In connection with an epitaph in Warwickshire, on a young woman, Mary Ashford, who was murdered in 1817, we are told that her brother, on the acquittal of the assassin, Abraham Thornton, sued out an appeal against him. Thornton, in preference to undergoing a fresh trial, claimed the privilege of wager of battle, and challenged the brother, who, however, being unwilling to fight, was obliged formally to "cry craven." Lord Ellenborough had, with reluctance, previously acknowledged, to general amazement, that Thornton was entitled to the option which he demanded. It was not till two years later that, by an act of Parliament, the ancient legal barbarity of which Thornton had availed himself was expunged from the English statute-book. With the transcription of a graceless epitaph, A. D. 1804, on an attorney at Castleton, in the Peak of Derbyshire, who apparently hoped that wit would be discovered, by the discerning, in his posthumous impudence and irreverence, we close our notice of an entertaining little volume, which may be recommended to all who are interested in tomb-stone literature:

"Quid eram nescitis;
Quid sum nescitis:
Ubi abii nescitis.
Valete."

Addresses, Delivered on Several Occasions by Alexander Hamilton Bullock. With a Memoir by George F. Hoar. Boston: Little, Brown & Co. 1883.

THE preparation of this volume must have been a labor of love to Senator Hoar. One can easily gather from these speeches what a refined and elevating influence emanated from Gov. Bullock, and the affectionate relation in which he stood to the community in which he lived—qualities in which we believe American gentlemen of the best class are surpassed by those of no other nation. The addresses themselves, while not marked by very spontaneous or commanding eloquence, are polished and cultured in tone and sentiment, reminding the reader very strongly of Edward Everett, whom, indeed, Gov. Bullock seems to have held in very high esteem. Most of the earlier parts of the volume were contemporary with and have reference to the civil war, and it is worth observing how thoroughly even a disciple of Webster and Everett, to whom the Union and peace had seemed inseparable, was stirred to uncompromising resistance. Perhaps only those who are old enough to remember those fearful days can imagine how deeply audiences were moved by such appeals. The eulogy upon Abraham Lincoln, however, seems inadequately to express a full appreciation of a character which could hardly find response in the somewhat aristocratic mind of an old-fashioned Whig. The school of Edward Everett knew but little of the brotherhood of equality with the poorest and lowliest, which was one of the distinguishing qualities of President Lincoln.

One of the most interesting addresses is that on the "Centennial Situation of Woman," delivered at Mount Holyoke Seminary in 1876, in which the position of the female sex, certainly one of the most important characteristics of this country, is strongly set forth; but that the Governor could upon occasion apply the Harvard maxim of *vera pro gratis*, is shown by his taking that occasion to make a strong argument against female suffrage. The "Centennial of the Massachusetts Constitution" is also of interest, especially in view of the events of the past year. It is pretty evident that that instrument will ere long become the object of something besides unmixed eulogy, and that after a century of wear it will need to be hauled up for repairs. It is a curious circumstance that though Governor Bullock was a member of the State Legislature from 1845 to 1849, was Mayor of Worcester in 1859, Speaker of the House of Representatives from 1862 to 1865, and Governor of the State in 1866, 1867, and 1868, he left no more trace upon public affairs than does the passage of a boat through water. The same is true of all the Massachusetts Governors since Andrew. It has come to be considered a gross impropriety for a candidate to urge his personal claims for office. Now, in the address on "Intellectual Leadership in America," Governor Bullock says that "the spontaneous, instinctive acknowledgment of intellectual authority, the law of faith, of confidence in a superior intelligence, is a part of the laws governing public opinion. We are all of us and always under such a lead. And the globe has not borne another people who paid greater deference to such guides than our own." And Mr. Matthew Arnold is reported to have recently said that in England it is the politicians who are the object of interest which in this country seems to be turned towards the literary men. It is safe to say, however, that in this country also eminence in politics would command the attention of ten persons where that in literature attracts one. The jealousy which suppresses the former is, therefore, on Governor Bullock's showing, a violation of the first principles of human nature.

Encyklopädie der Neueren Geschichte. In Verbindung mit namhaften deutschen und ausserdeutschen Historikern herausgegeben von Wilhelm Herbst. Parts 1-16. Gotha. 1880-1883.

THIS work was originally calculated to embrace two large volumes, in twenty *Lieferungen*. Of the latter, however, sixteen have appeared, and they reach only as far as "Heinrich." We may hence presume that the whole will be finished in three volumes. The scope is narrowed down to political history—literature, inventions, statistics, etc., being almost entirely excluded. The history of the leading European nations is most amply treated, and that of the Asiatic and African countries only in its relations to western politics. Biographical articles predominate; in fact, most of the history is told in biographies, the length of which ranges from half-a-dozen lines to about a dozen pages. Completeness is aimed at as to topics, but not exhaustiveness under the single titles. In some instances the collective articles are exceedingly brief, and the needed information is designedly left to be gathered almost entirely from a large number of notices treating of the separate parts of the subject. Thus, while the history of France in the last four centuries—its "modern history," in the sense of this encyclopædia—is presented in a condensed sketch comprising every reign and revolution, the history of Germany must be compounded by the reader primarily out of the contents of the articles on Baden, Bavaria, Brunswick, etc., which are very full. In other instances, the history of what is now a component part of a great state, though it was an independent whole even in modern times, is omitted under its own head. Thus the history of Brandenburg is to be told hereafter under "Preussen." The reader is expected to comprehend the reasons of omission, a considerable amount of knowledge on his part being presupposed in general. A very lucid and elaborate introduction, however—the only contribution of the original editor, who died in December, 1882—is to serve as a clew to the whole course of events, universal and national, as here compassed. A list of twenty-seven contributors (mostly professors of history) to whom special parts have been assigned is a guarantee of careful execution in nearly every branch. The style is almost uniformly good, and no room is wasted.

As an addition to a large universal history, like Schlosser's, or to a good cyclopædia, like Meyer's or Brockhaus's, this publication is highly valuable. Vastly superior in correctness of execution, and partly also in fulness of contents, to the corresponding portions of history in almost all collective works, it also comprises a mass of biographical details such as no connected history can find room for. But, well planned as it is as a complement to works more comprehensive in their scope, even as such it is here and there very defective. Its selection of topics is good as a rule, but unjustifiable omissions are frequent. Thus, the notices of both Abd-el-Kader and Algeria are too brief, Afghanistan appears separately only in a notice of the Afghan treaty of 1869, under "Cypern" there is no mention of the British occupation of the island, and Bulgaria is entirely forgotten. English biography is amply represented in numerous and often lengthy articles, like those on Bacon, Beaconsfield, Bolingbroke, Brougham, the Buckinghams, Cromwell, Elisabeth, or Gladstone; French and Spanish historical characters are equally well remembered, and Professor Schwicker, of Buda-Pestb, does more than his share of the work in extensive and interesting notices of such Magyars as the Báthorys, Batthyányis, Bercsényi, Bethlen, Bocskay, Deák, or Eötvös; but Professor Liske, of Lemberg, leaves out such eminently historical Polish names as Czarnecki, Dwernicki, and even Chlopicki; and North American biography has been unfortunately surrendered to an historian—Professor Hertzberg, of Halle—who does excellent work on Greece and the Ottoman Empire, but has very scanty knowledge of things and men on this continent.

The history of both North and South America is very carelessly treated in this work. The article "Chile" is meagre; and while there is a

notice of Costa Rica, there is none of Bolivia or Ecuador. Colombia and the Argentine Republic are equally forgotten in the first volume, but they may possibly turn up as "Kolumbien" and "La Plata." The notices of European battles are so numerous that even the insignificant engagements of Caldineo, Courbevoie, and Chrobrz are recorded under their own heads, but no separate room has been devoted to Antietam or Chancellorsville—not to speak of Chickamauga or Fredericksburg. The last-named battle is mentioned as that of "Friedrichsburg" under "Burnside," and turned into a two days' fight; the date of Chickamauga, under "Garfield," is changed from Sept. 19–20 into "Sept. 29–30." Under the latter title the battle of Pittsburgh Landing, or Shiloh, is extended into a three days' engagement "at Pittsburgh"; Garfield himself is sketched as panegyrical obituaries described him. Less room is devoted to both Adamses than to Van Buren alone (under "Buren"); and while Aaron Burr, John Brown, and Beauregard are forgotten, a separate title introduces Belknap—in colors little flattering to himself or to his chief, General Grant, who is also severely criticised under his own name. Similar inconsistencies and inaccuracies are incomparably rarer in contributions referring to European subjects, and most of the incorrect dates or names which we have discovered in glancing over the pages of the book may be attributed to slips of the compositor and proof-reader. The greatest editorial slip is the giving of two articles, different in length and composition, on the bloodless war of the Bavarian succession, one entitled "Bayerischer Erbfolgekrieg," and the other "Erbfolgekrieg, Bayerischer." A much more serious war of succession, the Polish, is omitted. The great general merits and usefulness of the work, however, make us easily overlook the defects we have pointed out.

Ancient Egypt in the Light of Modern Discoveries. By Prof. H. S. Osborn, LL.D. Cincinnati: Robert Clarke & Co. 1883. 16mo, pp. viii.–232.

THE recent discoveries in Egypt, which have materially changed the conception of its history held even ten years ago, are scattered over so many volumes that it would be almost impossible for any one but the specialist to keep himself informed of the progress of things in this department; it is therefore a praiseworthy attempt that Mr. Osborn has made to present the new material in small compass and in popular form, and in some respects he has succeeded very well. He gives clear and generally correct accounts of the probable origin of the Egyptian people, of the historical chronology, of the history, the monuments, and the social life. He has almost nothing to say of the religion, and this we must think a fault; but in the descriptive material that he introduces he is commonly clear and sensible —thus, he rejects Piazzi Smith's nonsense about the pyramids, and regards them simply as tombs of the sovereigns. It is to be regretted that he has not confined himself to describing what he has seen; unfortunately, he wanders here and there into the field of historical criticism, where he is not at home. He thinks (p. 224) that the genuine Egyptian coloring of parts of Genesis and Exodus sets aside modern results as to the date of the Pentateuch; following Professor Campbell, of Montreal, he is inclined to hold (p. 201) that the book of Chronicles is "in advance of any other [in the world] except Genesis, so far as historic accuracy and history are concerned," and (p. 200) that "the list of names in the first eight chapters of 1st Chronicles contains a key to universal history." He seems to suggest (p. 217), though his language is here not clear, that the Egyptians and the Iranians were once one people; he thinks it probable (p. 218) that "even before the First Dynasty" divine communications were made to the Egyptian kings, and that this was the origin of what he regards as the primitive Egyptian monotheism; he finds no difficulty in reconciling the Biblical date of the Flood with Egyptian history (p. 103); he narrates as history (p. 186) the story told by Herodotus of the vengeance taken by Queen Nitocris on the murderers of her brother; and he cannot refrain from dealing the doctrine of evolution a heavy blow—"one suggestion," he says (p. 221), "we might drop in passing—to the sorrow of the evolutionist: It is found in the perfectly unchanged appearance [on the monuments] in all the species, both of plants and of animals." These critical crudities mar the usefulness of the book, and we hope that, if a second edition is called for, they will be omitted. Occasional careless and inaccurate historical statements occur: the Ethiopians are called (p. 62) a "mixed race," for which the author quotes Renouf and refers to Lenormant, but there is no ground for such a statement; the date of the Jew Philo, who went on an embassy to the Emperor Caligula, is given (p. 30) as B. C. 20. Mr Osborn puts too much trust in Lenormant, whose unproved and highly improbable assertion that "the Hamitic race of Cush founded a powerful empire at Babylon, and this is a fact of great importance in tracing the migrations of the races," he quotes (p. 56) as if it were an assured fact. A minor blemish is the use of the word "transpire" (p. 43) in the sense of "occur"; and what shall we say to such a sentence as this (p. 103): "So that the agreement between the Biblical date of 1656 and the Egyptian Dynastic date, even if we take them all in such years as we now use, would fully agree, upon the sole condition of altering the date of Ussher, namely, 4004, and not altering the Biblical date of the flood whatever"?

Theory and Practice of Teaching. By the Rev. Edward Thring, Head Master of Uppingham School. The Cambridge University Press. 1883.

A FEW personal words in regard to Mr. Thring may be justified in drawing the attention of educational men in America to the last book which he has written. We have heard a distinguished Oxford professor, well known in America as in England, and who was Dr. Arnold's trusted assistant in Rugby's palmy days, say that Thring had more of Arnold's spirit in him than any schoolmaster left in England. At the Head Masters' Conference, held at Dulwich College, in 1876, Dr. Carver, the President, referred to Mr. Thring as the real founder of the Conference, and as one who could claim the unique honor of having forced an ordinary county grammar school, within his own lifetime, into the front rank of England's great public schools. We mention these facts, which happen to be within our knowledge, merely to show that our author is a man of purpose and personal power, whose thoughts on professional questions ought to be worth reading.

In his book we have something very different from the ordinary work on education. It is full of life. It comes fresh from the busy workshop of a teacher at once practical and enthusiastic, who has evidently taken up his pen, not for the sake of writing a book, but under the compulsion of almost passionate earnestness, to give expression to his views on questions connected with the teacher's life and work. Though written largely from an English point of view and as the result of English experience, it deals with fundamental principles, and discusses questions as interesting to American as to English teachers. The style is at times belligerent. Fighting the battle of what he believes to be educational freedom and truth, Mr. Thring hits hard blows. The reader will sometimes be compelled to qualify an exaggeration of statement, but we doubt if any true teacher will often have reason to question the solid basis of truth on which the arguments are built. He asks pregnant questions: "What, again, is the true price of a teacher in the market, and why? If the true price is not given, the further question arises whether a system which requires martyrs to work it truly, does not in the second generation get worked by cheats." Many of our readers will admit that questions such as these require an answer in America as well as in England.

In part the book is a protest—a protest against the subjection of the skilled educational workman to the unskilled theorist; of the living teacher to the dead and deadening influence of excessive state control. It can easily be imagined that a teacher who frames as his highest definition of education the "transmission of life from the living, through the living, to the living," has little faith in machine systems of education. He is inclined to jeer at the rule-of-thumb applied to this living power dealing with life. He believes that intellectual death is the only possible result that can come from making the teacher a mere machine, with his work and its worth tested and ticketed by another examining machine, which compels all that come under its control to pass through one and the same intellectual hole which it has drilled as a gauge of merit. He protests against the jealous suspicion which dogs the teacher's steps in our modern systems. "It is a strange spectacle," he says, "everywhere seen, though no one sees it—the spectacle of the nation putting their best hope, their children, under the charge of men whom they do not trust to do their work, and so put them under the charge of others." He asks that "freedom should be given, and a belief in skill, and a trust that skill will in the long run know how to work best."

Doubtless modern education has its real Scylla and Charybdis in the two aspects of the examination question. On the one side is that excess of system and supervision which kills true life and original power, and on the other is that lack of system and supervision which leaves room for the grossest quackery, imposture, and waste of means. Against the former of these dangers, as perhaps the more threatening evil of the present day, Mr. Thring raises an earnest voice of warning:

"If education and training are the true aim of mankind, and power in a man's self the prize of life, then no superstition ever ate into a healthy national organism more fatal than the cult of the examiner. Better in its degree the negro bowing down before the ghastliest fetish, than the civilized mumbo-jumboism which thinks it can award over a whole kingdom the palm of mind. Examinations in that case are but another name for death to originality and all improvement that is original."

It is easier to admit the truth of this than to fix the exact point to which the examiner may go without becoming a bane. Our author suggests a pass examination, sufficient to discover culpable idleness or dishonest neglect. This he considers honest for the teacher and not destructive of life. The fatal point is reached when "all the varieties of living growth must be reduced to a lifeless uniformity to make them capable of being appraised by an examiner."

All that we have referred to, however, is secondary to the main purpose of the book, which is to lay down for practical teachers the principles that should guide them in training (not stuffing) the young mind. For suggestiveness and clear incisive statement of the funda-

mental problems which arise in dealing with the minds of children, we know of no more useful book for any teacher who is willing to throw heart, and conscience, and honesty into his work. A few sentences taken at random may serve to illustrate the spirit in which Mr. Thring discusses the work of the schoolmaster:

"The teacher must be full of human sympathy, inwardly exhaustless in kindness and patience—willing to bear anything but refusal to be taught, and fertile in resources even for that."

"A dull boy's mind is a wise man's problem."

"A teacher's first maxim is: 'If the boys don't learn, it is my fault'; his comforting axiom is, 'The worse the material the greater the skill of the worker.'"

"Time and teaching and love—these three can slowly and surely make the eye see, and the mind inspire the eye, and be inspired in return. The slowest can begin, though the swiftest cannot end. Time, teaching, and love—these three transmute all things when life is at work. There is no incapacity which can prevent observation. And there is no inability to enjoy what observers give. . . . The problem of power in a man's self is capable of no hard solution; there is no stupidity."

"Training means accuracy. Observation and accuracy are twins. The beginning of all true work is accurate observation; the end and crown of all true work is an accuracy which observes everything, and lets nothing escape. . . . Observation and accuracy comprise all that it is possible for a teacher to do."

We hope we have said enough to induce some teachers in America to read Mr. Thring's book. They will find it a mine in which they will never dig without some substantial return, either in high inspiration or sound practical advice. Many of the hints and illustrations given are of the greatest value for the ordinary routine work of the class-room. Still more helpful will the book be found in the weapons which it furnishes to the schoolmaster wherewith to guard against his greatest danger, slavery to routine.

Trees, and How to Paint Them in Water-Colors. By W. H. J. Boot. With eighteen colored plates and numerous wood-engravings. London and New York: Cassell & Co. 1883.

Of popular treatises on the art of painting we have rarely before seen one so good as this. While bearing at first glance a somewhat repellent appearance of kinship with the many existing superficial works on the subject, the book soon demonstrates the fact that it belongs in quite another category, and that it possesses the rare merit of stimulating observation of Nature, while it explains, about as well as words can explain, the methods by which the difficulties arising out of her complexities may be measurably conquered. Trees are among the most perplexing objects which embarrass the beginner in sketching from nature. But this author shows that it is possible, in painting them, to proceed in so orderly a way from general proportions and tones to the more particular characteristics of form and color, that these perplexities are reduced to a minimum. Yet no illusive prospect of a royal road is held out. On the contrary, the fact that nothing but close attention and prolonged effort will insure progress is well impressed. It is extremely difficult to convey in words any intelligible or serviceable instruction with regard to coloring, yet Mr. Boot has succeeded so well that, with the help of the colored illustrations included in the book, we think that any young person of intelligence and aptitude might learn from it to do very good work. Certainly, if coupled with faithful practice under guidance of the plates of Turner's 'Liber Studiorum,' a course like this could barely fail to yield excellent results. The illustrations in chromo-lithography, though they possess the imperfections that are inseparable from work wrought by mechanical means, bear evidence of having been executed with care, and are, for such things, remarkably good—quite good enough to be very useful.

NEW BOOKS.

(*A Sumptuous Gift Book.*)

THE RENAISSANCE OF ART in Italy. An Illustrated History by Leader Scott, author of 'Fra Bartolommeo,' 'A Nook in the Appennines,' etc. Comprising a brief History of the Rise of Italian Art in Verona, Lucca, Pisa, and Ravenna; its Development in Bologna, Siena, Orvieto, and Padua; and its Culmination in Florence, Rome, and Venice. This work has been printed with great care on toned paper, and is embellished with upward of 250 engravings of important examples of architecture, sculpture, painting, engraving, mosaics, embroidery, metal-work, and wood-carving. 4to, cloth. Extra gilt, $10.50, or polished Levant morocco, $22.50.

*** A descriptive circular supplied on application.

WRAXALL'S HISTORICAL and Posthumous Memoirs, 1772-1784. By Sir Nathaniel William Wraxall, Bart. With Corrections and Additions from the Author's own MS., and Illustrative Notes by Mrs. Piozzi and Dr. Doran. To which are added Reminiscences of Royal and Noble Personages during the last and present centuries, from the Author's Unpublished MS. The whole Edited and Annotated by Henry B. Wheatley, F.S.A. Finely engraved portraits. A new library edition, in five volumes. 8vo, cloth, extra, $22.50.

*** The 'Memoirs of His Own Time,' by Sir N. W. Wraxall, occupy a position almost unique in the English Historical Library. They form nearly the only work that it can offer to compete with the delightful 'Mémoires pour Servir,' so abundant in French Literature. It rivals them in its plenitude and piquancy of Court Gossip, both English and Continental, and private (not to say sometimes scandalous) revelations respecting the great names of history that loom up so grandly in the panorama of the past.

HENRY IRVING: A Biographical Sketch. By Austin Brereton. Illustrated with 17 full page portraits from drawings by E. Long, Whistler, Barnard, Val. Bromley, Tilt, Mrs. Allingham. 8vo, cloth, extra, $3.00.

MONTHLY MAXIMS, Rhymes and Reasons, to Suit the Seasons; and Pictures New to Suit them too. By Robert Dudley. With numerous full-page and other illustrations by the author, printed in the highest style of chromo-lithography. Medium 4to, cloth, gilt, $4.00.

*** This work is printed on the finest ivory cardboard, linen-hinged, and is illustrated on every page by the author, whose drawings have been reproduced with the utmost fidelity. Excellently adapted for presentation.

THE HEROES OF ENGLAND. Stories of the Lives of England's Warriors by Land and Sea. Edited by John G. Edgar. With an account of Admiral Collingwood added. Twelve illustrations in permanent photography. 8vo, cloth, extra gilt, $3.00.

CRAWHALL'S CHAPBOOK Chaplets, including Reprints of the Old Ballads of 'The Barkeshire Lady's Garland,' 'I Know What I Know,' 'The Taming of the Shrew,' 'Blew Caps for Me,' 'John and Joan,' etc., etc., with fac-similes of the old cuts, covers, etc., colored by hand. 4to, board, $12.00.

*** A limited number only of this curious reprint have been issued.

THE CITY IN THE SEA. Stories of the Deeds of the Old Venetians. From the Chronicles. By the author of 'Belt and Spur.' With 16 illuminations from MSS. and copies from Canaletto, Uccello, Gozzoli, etc., etc. 12mo, cloth, gilt, $2.

*** Also, a New Edition of 'Belt and Spur,' Stories of the Knights, with illuminations. 12mo, $2.00.

A SOUVENIR OF AN EMINENT AUTHOR.

MATTHEW ARNOLD BIRTH- day-Book. With appropriate selections from the various Writings of this author, and spaces for Notes and Autographs. Selected and arranged by his Daughter. 4to, cloth, gilt, with photograph, $3.75.

LIFE IN ROME IN THE DAYS of Cicero. Sketches drawn from his Letters. With colored illustrations from the Antique. By Prof. A. J. Church, author of 'Stories from Homer,' etc., etc. 12mo, cloth, $2.00.

*** Also new editions of the previous nine volumes of this author's popular stories from the classics.

THE ROYAL COOKERY BOOK (Le Livre de Cuisine). By Jules Gouffé, Chef de Cuisine of the Paris Jockey Club. Translated from the French and adapted for English use by Alphonse Gouffé, Head Pastry Cook to the Queen. Comprising Domestic and High-class Cookery. With 16 large colored plates and 161 woodcuts, from drawings from nature. New edition. Imperial 8vo, cloth, extra gilt, $15.

THE PHARAOHS AND THEIR Land: Scenes of Old Egyptian Life and History. By E. Berkley. With colored illustrations. Cloth, gilt, $2.

THE MACLISE PORTRAIT Gallery of "Illustrious Literary Characters." With Memoirs, Biographical, Critical, Bibliographical, and Anecdotal, Illustrative of the Literature of the Former Half of the Present Century. By William Bates, B.A. Crown 8vo, with eighty-five portraits, cloth, $3; half calf, gilt, $5; half morocco, extra, gilt top, $6.50.

SOCIAL LIFE IN THE REIGN of Queen Anne. Taken from Original Sources. By John Ashton, author of 'Chap Books of the Eighteenth Century,' etc., with eighty-four illustrations by the author from Contemporary Prints. Edition de Luxe of 100 copies on large paper, 4to, vellum backs, $9.00; half calf extra, $13.50; half morocco extra, $15.00.

ANCIENT GREEK FEMALE Costume. Illustrated by a series of 112 full-page plates and about 30 smaller illustrations, with explanatory letterpress and illustrative passages from Homer, Hesiod, Æschylus, Sophocles, Pindar, Herodotus, Euripides, Aristophanes, Xenophon, Theocritus, Plutarch, and Lucian. Selected and arranged by J. Moyr Smith. Crown 8vo, cloth, $3.

SINTRAM AND HIS COMPAN- ions. By De La Motte Fouque. A new translation with numerous illustrations, by H. Sumner. 12mo, cloth, $2.00.

COLERIDGE'S LECTURES AND Notes on Shakspere and Other English Poets, including Mr. Collier's Transcript of the Lectures of 1811, now first collected. By T. Ashe, B.A., author of 'Songs Now and Then.' Small post, 8vo. (Bohn's Standard Library.) $1.40.

*** The above books are for sale by all booksellers, or will be sent upon receipt of advertised price. Catalogues of rare and curious second-hand books, and detailed lists of our regular stock, will be sent upon application.

SCRIBNER & WELFORD, No. 745 Broadway, New York.

NEW

Illustrated Books.

Sunlight and Shade.

Being Poems and Pictures of Life and Nature. Illustrated by Barnard, Barnes, Barraud, Boot, Clausen, Dodd, Dicksee, Edwards, Gardner, Gow, Gregory, Hatherell, Hopkins, Kilburne, Macbeth, Overend, Palmer, Ralston, Small, Wyllie, and many others of the best artists of the day.

An elegant quarto volume, with an illustration on each and every page, and accompanying text, either original or selected, from favorite poets. One vol., 4to, beautifully printed on fine paper, and bound in extra cloth, full gilt, $3.00; full morocco, extra gilt edges, etc., $7.50.

The Forging of the Anchor.

A Poem, by Samuel Ferguson, LL. D., with twenty original illustrations specially executed for the work by Barraud, Glindoni, Harvey, Hatherell, Lucas, Ludlow, Nash, Overend, Staniland, Wyllie.

It is gotten up in a handsome quarto form, elegantly printed on extra heavy plate paper, and handsomely bound in extra cloth, gilt edges, with gold and colored inks. A delightful volume. $1.50.

Some Modern Artists and their Works.

With Portraits and examples of the works of Sir Frederick Leighton, P. R. A., Sir John Gilbert, R. A., G. H. Boughton, A. R. A., Vicat Cole, R. A., Joseph Edgar Boehm, R. A., Henry Stacy Marks, R. A., Jean Louis Ernest Meissonier, Mrs. Butler, Sir Joseph Noel Paton, R. S. A., LL. D., Rosa Bonheur, Laurens Alma Tadema, R. A., Harris Thornycroft, A. R. A., Luke Fildes, A. R. A., William F. Yeames, R. A., Geo. Dunlop Leslie, R. A., Briton Riviere, R. A., Michael Munkacsy, etc., etc. In one elegant large quarto volume full gilt, $5.00; full morocco extra, $10.00.

OUTLINE ENGRAVINGS TO

The Tempest and Prometheus Unbound.

The Tempest, by William Shakspeare, containing fifteen engravings in outline, and Shelley's Prometheus Unbound, containing twelve engravings in outline from compositions by Sir J. Noel Paton, with appropriate text. The two vols. in one. Crown 4to, oblong, handsomely bound, cloth extra, $2.00.

European Butterflies and Moths.

With sixty-one colored plates, based upon Bergis's "Schmetterlingsbuch," by W. F. Kirby, assistant in the Zoölogical Department, British Museum, and Secretary to the Entomological Society of London. With index to English names, and index of Genera and Species. 1 vol., large quarto, full gilt and colored inks, $15.00.

Familiar Wild Birds.

By W. Swaysland, with forty colored lithographic plates, truthfully drawn, and done in the highest style of the art. Ornamental initials and tail-pieces. 1 vol., 12mo, full gilt, colored ink, and hand-painted, $5.00; full calf, $7.50; full morocco, $7.50.

The Magazine of Art.

Volume VI., with steel etching and several hundred illustrations, new and elegant bindings. Extra cloth, bevelled, full gilt, $5.00; full morocco, $10.00.

"Messrs. Cassell & Company are to be congratulated upon the uniform excellence of the printing and typography of this handsome work, upon the superior quality of the paper and the elegance of the binding, and the high art standard sustained from the opening to the close."—*The Publishers' Weekly.*

NOW READY

Our complete Descriptive Catalogue of Illustrated and Fine Art Books, Juvenile and Educational Works, which will be sent free to any address upon application.

CASSELL & COMPANY, Limited,
739 and 741 Broadway, New York.

The Nation.

NEW YORK, THURSDAY, DECEMBER 13, 1883.

The Week.

THE President, in his message to Congress, begins as usual with foreign relations. The fisheries treaty with England comes to an end in 1885, and he suggests a commission to consider the "general question." As to assisted emigrants, he thinks the precautions taken by the English Government insufficient, and that legislation may be requisite, but does not say what legislation. The Iglesias Government, in Peru, he says he will recognize if it is approved by the new Congress summoned to meet on March 1. He thinks the Canton indemnity fund ought to be returned to China. With regard to the surplus, he is opposed to the rapid extinction of the national debt or excessive taxation, but thinks that the results of last year's legislation are not yet sufficiently apparent to justify any radical or sweeping modifications of existing law; and until these effects do show themselves, suggests that some of the surplus might be spent upon the navy and coast defences. He is in favor also of "substantial reductions" in the customs revenues, but not yet. He discusses the future of the banking system, and agrees with the Secretary of the Treasury in urging that the tax on circulation should be repealed, and the banks allowed to issue notes to an amount equal to 90 per cent. of the market value, instead of the face value of the bonds deposited as security for circulation. In order to get the trade dollar out of the currency, he would have it received at the Treasury and the mints as bullion, at a small percentage above the current market price of silver of like fineness.

There is no reason, the President believes, to expect any trouble from the Indians, but he calls the attention of Congress to the importance of perfecting the defence of the sea-coast with torpedoes, and urges the reconstruction of the navy. Government control of the telegraph he opposes, on the ground of the increase of the civil-service list it would require. He thinks that Government ought to be authorized by law to exercise "some sort of supervision over inter-State telegraph communication," but does not say what sort. He again submits to the consideration of Congress "whether some Federal aid should not be extended to public primary education." The Anti-Polygamy Act he pronounces a failure, and thinks that the Territory should be handed over to a commission, "with such power and duties as shall be delegated to it by law." He finds the working of the Civil-Service Act beneficial, and advises the passage of the act already adopted by the Senate on the Presidential disability question, and that the Executive should be given the right to veto separate items of the appropriation bills.

This last suggestion of the President has been acted upon by Senator Lapham, who has prepared a joint resolution to amend the Constitution for the purpose. This has brought out the curious fact, according to a Washington despatch, that there is a disinclination on the part of many Senators and Congressmen to amend the Constitution at all. Probably, however, their belief that it is a perfect and unimprovable instrument applies chiefly to those portions of it which give them power. Their right to force the Executive to take an appropriation as a whole, or not at all, is a piece of arbitrary privilege which would probably never have been put in the Constitution at all if the framers of it could have foreseen the way in which Congress would do its work. They looked forward to appropriations being discussed by it as matters of business, and never dreamed that Congress would reach the point of appropriating millions of money against the wishes of the country at large, and the wishes and advice of the Executive which was to spend it.

The Treasury report this year is more than usually turgid, and is in some parts hesitating and apologetic to a painful degree. The long argument which the Secretary spins out to sustain the view that the national banks are useful to the community, and that their circulation ought to be kept going, and that the tax on circulation ought to be repealed "in whole or in part," so that contraction of the currency may be prevented, reads like the production of one who is fearful lest the Greenback-Labor party should presently overrun the country and turn all the good men out of office. In this regard the report is far less satisfactory than the President's message and the report of the Comptroller of the Currency, both of whom recommend the repeal of the tax, in plain English, for good and sufficient reasons, and without apology. The line of reasoning with which the Secretary opposes the Barker-Blaine projects for distributing the surplus revenue among the States is extremely verbose, and reads like a plea in chancery. As regards the reduction of taxation, the report argues both for and against it—for it where the bank question is treated, and against it where the tariff is treated. The conclusion reached, if we may call it a conclusion, is that although the repeal of taxes last year has not lessened the revenue so much as was expected and intended, by $30,000,000, yet sufficient time has not elapsed since the repeal went into effect to determine the ultimate results of the reduction, and that, therefore, "it may not be deemed expedient so soon to make again a revision of the tariff to effect a reduction." Nevertheless, the Secretary adheres to the conviction that "ultimately the just and expedient method of relief from taxation, and of limiting the revenues to the needs of an economical government, must be found in a reduction of the duties on imports."

The more important recommendations of the Secretary of the Treasury are that the trade dollar be redeemed in standard silver dollars and recoined, the bullion contained in them being reckoned as part of the two millions per month now required to be coined; that the silver coinage be suspended except as regards the recoinage of the trade dollar until the public demand for silver dollars overtakes the supply; that the banks be allowed to issue circulating notes up to 90 per cent. of their security bonds, and that the tax on circulation be repealed in whole or in part; that the Hawaiian treaty be continued; and that "there ought to be a reduction of taxation." The last recommendation is, however, qualified by a counter-recommendation that there ought not to be any immediate revision of the tariff; and since all of the internal-revenue taxes have been repealed except those on spirits, tobacco, and bank circulation, the subject of dealing with these articles is confided to the wisdom of Congress, with a suggestion that alcohol used in the arts be exempted from tax, and that bank circulation, as previously mentioned, be exempted in whole or in part. The Secretary appears to be inclined to look favorably upon a total repeal of the tobacco tax, but his argument elsewhere in favor of retaining the taxes on luxuries goes far to countervail the hint which he drops in reference to tobacco.

The conversion of Mr. W. D. Kelley on the silver question, so far as to make him introduce a bill for the stoppage of the silver coinage, is a curious and interesting phenomenon. There are other conversions among the furious silver men of seven years ago, such as that of Murat Halstead, almost equally remarkable. That these gentlemen have been converted is, of course, creditable to their candor and common sense. When they were furiously preaching the bi-metallic gospel they refused to be guided by the recorded experience of mankind, or by the deductions therefrom made by leading economists. They insisted on having experience of their own. Now they have had it, and they admit that they were wrong. It would be ungracious to reproach them for all this, but we must call their attention to the enormous inconvenience of having the affairs of a great nation conducted in disregard of the history of the doings of the rest of the human race. Of course the world goes forward in large part by the trial of novelties, but it would not go forward at all, or would only go forward to a general smash-up, if some things, at least, were not treated as settled and beyond dispute. We hope, too, that the experience of the country on this silver question will produce greater sober-mindedness and moderation in future financial discussions. Mr. Kelley himself, honest man as he is, must feel humiliated and ashamed when he remembers that he delivered a lecture in Chicago, in the height of the silver fever, in which he urged us to adopt the silver standard, for one reason, because Abraham had paid silver shekels for the cave of Machpelah.

It is evident that the first week's discussion of the issue raised by Mr. Carlisle's election has encouraged the Democrats to adhere to their new position on the tariff. They have

found out, evidently to their own surprise, that their attitude in favor of a low tariff is much more popular than they expected it would be. They have met the full brunt of the protectionist attack, and have not been perceptibly injured by it. Mr Carlisle's conservative speech on taking the chair spiked the heaviest protection gun, by showing that he was not a free-trader in the sense that he was in favor of abolishing the tariff at a single blow. The protectionists accuse him of changing his ground in that speech, but all that he did was to show that the ground which he and other tariff reformers occupy was not the ground which the high-tariff defenders had attributed to them. Heretofore, when the protectionists have made this charge, the Democrats have virtually admitted it by running away, instead of standing their ground and explaining. Another gain for them has been the futile use of the sectional issue. It was employed with great vigor by the Republicans for a few days, but has been withdrawn for the present, and, although it may reappear next year, it has evidently lost the greater part of its old "power."

It may be regarded as settled that no surplus-distribution scheme will play a prominent part in the campaign of next year. The Barker plan never gained any foothold outside of Pennsylvania, and Mr. Blaine's modified imitation cannot be said to have gained a foothold anywhere outside the columns of the two or three newspapers which are joint owners in every form of a Blaine boom. The whole press of the country, with these few exceptions, condemned the plan with a vigor and unanimity which were evidently comprehended by Mr. Blaine himself, for he has given semi-official notice that the plan has been withdrawn for the present. In removing it from public view he remarked, with a comical assumption of ruffled dignity, that it really was not worth while for the press to attack it so violently, since it belonged to the future and not to the present. He had merely suggested such a disposition of the whiskey tax when the Government reached the point at which it would be able to get along without it.

The fact that less than six months remain before the customary period for holding the Republican National Convention has occasioned very little remark. It required some outward and visible token, like the assembling of the National Committee, to put people in mind of the coming event. The Committee met in Washington yesterday to prepare the usual call, but their coming together was not attended with anything like the excitement which prevailed four years ago. Indeed, there is no excitement at all, and no considerable interest except as to the place where the Convention shall be held, and as to the mode of choosing the district delegates. It will be remembered that there was a bitter controversy in the last Convention over the contested seats from Illinois, growing out of the attempt of the majority in the State Convention to appoint all the delegates from the Congressional districts, in opposition to the wishes and votes of the nine districts which had chosen delegates opposed to the nomination of General Grant. In order to prevent such disputes hereafter, the Convention adopted a resolution instructing the next Committee to adopt methods and rules which should "secure to the several Congressional districts the right to elect their own delegates to the National Convention." The Committee were required to adopt these rules "within the next twelve months," and it is understood that they did so at a meeting held in Washington some three years ago. The method will be formulated in the call soon to be issued.

The place for holding the Convention is a subject of contest among the hotel-keepers of various cities rather than of rival candidates for the nomination. The "claims" of Chicago, Indianapolis, Cincinnati, Philadelphia, Baltimore, and Saratoga are under debate particularly with reference to their accommodations for a crowd. It is rather against Chicago that she furnished too much accommodation the last time, by providing a building of such enormous capacity that the spectators overwhelmed the delegates with deafening and long-continued clamor, protracting the sessions unnecessarily, and at times turning the Convention into a contest of sheer lung power between rival factions in the galleries. It is now pretty generally agreed to avoid such demonstrations and to choose a place of meeting where there will be little more room than sufficient for the delegates, alternates, and reporters. National Conventions of the Republican party have been held in Chicago three times (1860, 1868, and 1880), in Philadelphia twice (1856 and 1872), in Baltimore once (1864), in Cincinnati once (1876). There have always been reasons for selecting one place in preference to others —generally personal reasons, as a belief that the local sympathy would advance the interests of one or another candidate—but it does not appear that local sympathy ever exerted much influence except, perhaps, when Mr. Lincoln was nominated in 1860. Chicago was really chosen by the supporters of Mr. Seward, who did not anticipate that Mr. Lincoln would be a formidable competitor, and who judged rightly that, as against any other candidate, the local feeling would be strongly in their favor. Accordingly they pitched the Convention in the only place where the personal popularity of an opponent could do them much harm.

The proposed change in the basis of representation in the Republican National Convention, which Mr. Frye is said to be pushing, and which is supposed to be in the "Blaine interest," contemplates that the basis shall be the number of Republican voters in each State, instead of the total population. Such a change, if proposed in a National Convention of the party, would commend itself to obvious principles of justice. The basis of representation ought never to have been anything else than the number of persons actually represented—that is, Republican voters. Under the existing and uniform practice of the party, however, an overplus of representation is given to States which always elect the Democratic ticket, and to Territories which do not vote at all. While such a practice is incongruous, and would probably not be tolerated by the party if the question were a new one, it has been so sanctioned by usage that no body or collection of persons inferior to a National Convention should venture to make so important a change. The existing mode of representation has in its favor an unbroken line of precedent, which has become actually the common law of the party. If the Committee should undertake to change the basis without the previous instruction of a convention, individual members of the party would not feel bound by the new rule. It would be quite within the range of probabilities that two conventions would assemble at the appointed time—one chosen on the old basis and one on the new. In such a case the former would have the better claim to be called "regular." On the proposed new basis the Territories and the District of Columbia would be ruled out altogether. There never was any good reason why they should be represented in a convention to nominate candidates for whom they cannot vote. Yet it would be quite out of the power of the Committee to exclude them without the previous instruction of the party.

What is the matter with our friend Mr. Hewitt? On Monday he interrupted the call of the States in the House to offer a resolution, which reads like a burlesque, asking the President to secure such delay in the execution of O'Donnell, the murderer, in London, as will enable him (the President) first to find out whether O'Donnell is a citizen of the United States, and then to examine the records of the court in which he was tried to see whether he was legally convicted according to the English law and "the requirements of international law." In other words, the resolution seeks to have the President make himself ridiculous, and expose himself to insult by claiming the right of revising the proceedings of foreign tribunals in a case in which he is not even sure that the defendant is an American citizen. The mention of international law in the matter is probably based on an ignorant delusion that O'Donnell, if an American citizen, was entitled to a jury half of foreigners. The fact is that this old privilege of foreign defendants in English courts was some time ago abolished by statute. The best way of overcoming that difficulty now is to get Congress to pass an act restoring the operation of the rule in Great Britain, so far as Irishmen are concerned.

Butler seems to have really cut out work for himself for the remainder of his days, for he is organizing a boom of his own to enable him to give himself the Presidency. He has got control of the trades-union organizations all over the country; and one of them, in Massachusetts, the Lynn Workingmen's Association, has issued an address calling for a National Convention, to form a National party, which will "unfurl the banner of labor" and nominate a candidate for the Presidency and Vice-Presidency. The candidate for the Presidency will, of course, be Butler, who is said to feel very enthusiastic over his prospects. In a speech in Boston last week he chuckled over the fact that he should have polled so many

votes in the late election, in spite of the prayers of the clergy. The smallness of the majority against him, he maintains, "proves pretty conclusively that the clergy of Boston have very little influence with the Almighty."

The mere suggestion that the photographs of American girls of note should be placed on sale for purposes of notoriety and gain has been utilized in a way that few persons, except the very sharpest advertisers, would have conceived. The father of a Western girl announces in a despatch, which is sent all over the country on the authority of his full name, that any person found selling or offering for sale photographs of his daughter will be prosecuted to the full extent of the law. In order, probably, that there may be no mistake in identity, the full name and address of the daughter are given, coupled with the information that "her beauty has attracted much notice in Europe." This seems to us a decided improvement upon the old plan of advertising beautiful Western girls by announcing them as engaged to marry Mr. Tilden.

Mgr. Capel, discussing "Marriage," on Thursday night at Chickering Hall, adverted to the old question, Which is the best, the English system of marriages, arranged by the parties themselves, or the French one, of marriages arranged by parents? We trust the time is coming when this problem will be recognized to be practically insoluble. Those who take it up from time to time seem to overlook the fact that unless some way can be suggested in which the French custom can be introduced into England and America, or vice-versa, it is a waste of time to discuss the merits of the two systems. The entire relation of parent to child, the whole of female education, and probably the respective religions of the two countries would have to be changed before the marriage customs could be materially altered. Monsignor Capel is trying to do one of these things in converting America to Catholicism; but even he does not feel that he is paving the way for the adoption of the French marriage system here.

They are having a good deal of discussion in the Boston newspapers over Mr. Matthew Arnold's view of Emerson's literary position, but it is not very edifying or instructive, inasmuch as it consists, on one side, in the main, of simple dissent from Mr. Arnold's position, on the part of gentlemen who have hitherto achieved no reputation as critics, and who really have nothing to contribute to the controversy, except an expression of their dislike to hearing Emerson criticised unfavorably by anybody. It would, however, be misrepresentation to say that Emerson has been criticised unfavorably by Mr. Arnold, in so far as his position in the world of thought is concerned; for the sentence in his lecture which we quoted the other day, that Emerson was "the friend and aider of those who would live in the spirit," is surely the highest of all praise for a philosopher. The notion that you answer a criticism, however carefully prepared or well reasoned out, by expressing simple dissent, is one, however, which is widely diffused, and is, we suppose, part of the general revolt against authority which shows itself in all fields of human activity, whether mental or political. It is well illustrated in the remark of the female champion of woman suffrage who, having had the Apostle Paul quoted against her, answered: "Ah, there I differ with Paul."

The prominent features of the general business and financial situation may be summed up in the statements, first, that there is a large volume of traffic, which is conclusively shown by the increased tonnage and earnings of almost every railroad in the United States, as compared with the corresponding monthly and weekly reports at this season last year. Notwithstanding the great extension of more than 5,000 miles of road during the year, the percentage of increase of earnings has kept pace with that of the mileage. But, aside from this favorable showing for the railroads, all other comparisons are unfavorable as compared with last year. The extra traffic and production are being done by merchants and manufacturers for smaller profits than ever before, and, in many important lines of trade and industry, for no profit at all. This is well known to bankers and money lenders, and hence there is little disposition to advance capital for the further expansion of business; and the surplus capital driven from investment in Government bonds by their continued redemption, and which would, under more favorable circumstances, be loaned for that purpose, lies idle in the banks, which are overflowing with it. There is also a large trade balance due to the United States from Europe, which would come here in the form of imports of specie if there was any employment for the money. But rates of interest in the loan market continue abnormally low, and confidence in railway securities seems to be quite as unsettled as ever, owing to the continued distrust of the management of the properties, and the manipulations of the prices of stocks. There has been a constant and moderate movement of capital for investment in the better class of railroad bonds, and the amount of these afloat in the market has been greatly diminished; but, aside from this, capital still holds the distrustful attitude which it has maintained for the last year. One result of this is the continued decline in the prices of railway stocks, notwithstanding the increased earnings of the roads. Most of the dividend-paying stocks are down to near the lowest prices of the last three years, and a few are lower than they have been before in five years.

The question of minority representation is again undergoing a good deal of discussion in England in view of the almost certainly approaching extension of the suffrage by the assimilation of the county and borough franchise. Nothing very new has, however, been elicited except a suggestion which, if adopted in this country, would be a great relief to "kickers" and bolters, especially in the Republican party. On a good many occasions, during the past twenty years, these malcontents have desired to protest in the strongest way against the nominations of their own party, but only two ways of doing so were open to them. One was, to vote the Democratic ticket—a step which their souls abhorred, and which to many of them was intolerable. The other was to stay at home and not vote at all, but this sort of self-effacement was something to which a great many have always found it difficult to reconcile themselves. The English suggestion is that every voter should have the power of casting his vote as a negative vote—that is, of simply voting against a particular candidate, instead of voting for one. This is then to effect the result by giving the victory to that candidate whose proportion of negative votes is smallest.

About three months ago the Egyptian Government thought it desirable to get an authoritative declaration from the doctors of El-Azhar, the great Mohammedan college at Cairo, upon the pretensions and character of the False Prophet. El-Azhar is the great authority on all matters of Mussulman faith and discipline, and its utterances, though they have not the force of those of the Sheikh-ul-Islam, have probably more weight with all true believers. Mussulman doctors are always consulted by simple questions, which, when they emanate from the Sultan or other Mussulman government, are apt to be leading—that is, indicate clearly the answer that is expected. In this case, however, the field seems to have been left clear for the theologians. The opinion acknowledges that it is orthodox to expect another prophet to be sent by God and protected by Mahomet to sustain the true faith and fight the infidels. This prophet, unlike Mahomet, is to come from Medina and fly to Mecca, and he is to be recognized then by the notables and proclaimed as the true prophet. But he is to appear in the interval between the death of one Caliph and the nomination of another, and the new prophet is then to be offered the Caliphate, but is to refuse it. The consequence of all this is that the Mahdi of the Sudan cannot be the true prophet that is to come, because not only is the Caliph not dead, but this Mahdi, far from refusing the supreme power, seeks it. He is, therefore, a false prophet, and the opinion concludes by declaring that he is a liar, and by citing the verse of the Koran which says that "He who lies knowingly and with premeditation will have hell for his permanent abode." The prospects of the False Prophet, therefore, in spite of his military successes, must be considered decidedly gloomy.

The French Ministry on Monday met successfully the attempt of the Opposition to compel them to withdraw from their operations in Tonquin by refusing the appropriations necessary to carry on the war. They were sustained by a vote of 381 to 146, but M. Ferry, in defending himself and his policy, was compelled to make a kind of appeal *ad misericordiam*, which was probably a great help to him, by pointing out the serious injury inflicted upon French foreign policy by the shortlivedness of cabinets. Against some charges made in the debate, such as concealment in editing the Yellow Book, he really had no defence, and one of his supporters, M. Ribot, was compelled to admit that voting the credits would not be an approval of all the acts of the Ministry,

THE MORMON DIFFICULTY.

It cannot be said that either the President's Message or Mr. Edmunds's new bill gives us much assistance in deciding what further steps should be taken for the suppression of polygamy. Mr. Edmunds's new bill, which may be considered as a formal confession of the failure of the first one, makes the lawful husband or wife of a person accused of bigamy or unlawful cohabitation a competent witness in the prosecution, who may be compelled to testify; provides for the compulsory filing of a written certificate of every marriage ceremony in any of the Territories of the United States; abolishes female suffrage, and declares vacant all elected offices. The Message, on the other hand, recommends the assumption by the National Legislature of the entire political control of the Territory, and the committal of its government to a Commission, with such powers and duties as may be delegated to it by law. Such a Commission might, however, be armed with complete military power to-morrow and put in complete possession of the Territory, and yet we should not be much nearer than we are now to extirpation of polygamy. Moreover, the only way to enforce the registration of marriages under Mr. Edmunds's bill would be to punish the people who do take part in the marriage without registering. But how are these to be got at? Who is going to accuse them? Would it be a particle easier to convict a man (or woman) of failure to register than of polygamy itself? The power to compel the lawful husband or wife to testify does undoubtedly seem to be more nearly effective than anything else heretofore thought of. It is neither more nor less than the power to examine any man in the community as to the number of wives he has, and it may be an experiment worth trying. But suppose the Church were to permit any man or woman examined before a Gentile court in polygamy cases to commit perjury, which it will almost certainly do, how should we meet it?

The more one looks at the matter, and, indeed, the more one hears about it from every quarter, the more satisfied one becomes that the evil, if it is to be put down by law, calls for remedies very much more violent than any yet proposed, for the application of which our Government possesses no adequate machinery. The Mormon problem really brings us, for the first time in American history, face to face with the task of governing a wholly hostile dependency — a task for which the Constitution has made no proper preparation, and which, even if the Constitution had made preparation for it, American manners and ideas would render very difficult. Our experience in the South furnished a fair example of the troubles into which we plunge when we attempt anything of the kind, and yet the South was only half hostile. We had the negroes on our side, and had to deal with malcontents whose religious and legal ideas were the same as our own. Nevertheless, the only way we could manage them was to let loose on them a swarm of rascally adventurers to take possession of their treasury and local offices, and then support these adventurers with our army and navy. The scandals to which all this led are still fresh in everybody's mind. The public soon came to the conclusion that the worst government that the natives could set up was better than that which we tried to impose upon them. The explanation of the matter was that we had no trained body of officials, such as European governments have, to take charge of outlying and subject territories whose populations can only be governed by force, and whose manners have to be reformed and customs changed at the point of the bayonet, like India and Algeria. When we undertake anything of the kind we have to take Tom, Dick, or Harry for the work, and generally select him with but slight reference to his special fitness—generally for considerations connected with the party politics. More delicate work of this kind than the rule of Utah as a conquered province for the sole and simple purpose of reforming its domestic relations, no government ever entered on. In fact, no government has ever before undertaken to suppress polygamy by force, in a case where it was sanctioned by the manners and religion of the people. Such a duty necessarily involves arming the officer in charge of it with enormous discretionary powers. He ought, in fact, to have the power of making an inquisition into every Mormon household, of arresting any man or woman whom he suspects of living in bigamous relations, and examining him or her on oath; and not only this, but of utterly disregarding his or her denials and deciding the case on mere appearances. Who are the men among us, civil or military, lawyers or laymen, whom the American people are willing to see trusted with such powers, or would consider fit to execute them, or would long permit to execute them? Would not attempts to execute them result in such gross and oppressive abuses as would soon make the Mormons, polygamists and all, objects of general sympathy?

At the bottom of the Mormon difficulty, as far as the women are concerned, is undoubtedly the immense improvement in their physical and social condition which the Mormon Church has wrought. In thinking of them and discussing them in this part of the world, we usually picture them to ourselves as persons of some refinement and education, who, in their present condition, are suffering from the pangs of remorse and a deep sense of degradation. The truth is they are mostly European peasants of rather a low class, to whom Mormonism has brought considerable social elevation and great increase of comfort. The experiments hitherto made for their deliverance seem to show that nothing will accomplish it except the offer to them of some equivalent. Hitherto we have done nothing to disgust them with their condition beyond threatening to put their husbands, who are their sole support, in jail, and throw the superfluous wives out upon the world. We have yet to see the effect on the women of something in the shape of real missionary effort, which would combine moral teaching with a promise of material security and independence.

STRIPPING FOR THE RACE.

Mr. James Bryce has been recently giving a lecture in Cambridge, on the way in which a man in England may "become a candidate," or, as we should say, may get a nomination. The system, he says, is as follows:

> "In the majority of cases the initiative must come from the candidates, though they desire to make it appear that the office comes to them. The person who desires to become a candidate looks about for a constituency to elect him. Usually he is not wholly at sea. He generally has some friends or connections, so that he stands a better chance in one place than in others. But if he is wholly at sea, he usually goes to the central office of the party in London, and says that he is a candidate, saying also what he holds as his opinions, and what he is ready to put up."

After this it is no wonder that a nomination, once secured, should be followed by a canvass of a strange sort. It consists of what Mr. Bryce picturesquely calls "nursing" the constituency. The candidate "gets his friends to give dinners"; he opens "bazaars," and "buys at them a lot of ugly things that he does not want and leaves outside the door"; he "meets the ladies," subscribes to horse-races, sometimes buys a fine house and gives entertainments. American candidates for Congress, thank Heaven, do not have to go through any such degrading process, and even in the Presidential field, where we always hear so much nowadays of the influence of money, our system is very different. Among the various symptoms of an approaching Presidential contest, such as is now impending, there are none more significant than certain minor features which begin to appear in the daily life and behavior of the candidates.

When Mr. Randall became a prominent candidate for the Speakership, and through that for the Presidency, there suddenly appeared with him a little feature of his life of which no one had ever heard before, but which, when known, proved strangely interesting. It was the ownership and use of a horse and buggy, and this horse and buggy played a striking part in his preliminary canvass for the Speakership. At first sight it might seem as if the appearance of a man's horse and buggy would throw no light on his qualifications for either the Speakership or Presidency; but the fact is far otherwise. In the first place, the horse was no fast trotter, such as indicates in the owner a passion for money, or display, or coarse pleasures. It was a good, quiet, plain family horse, such as any constituent of Mr. Randall's might drive to church or to a fair without attracting attention. In the same way the buggy was a simple American buggy, of plain native design and manufacture—just such a buggy as a man gets when he wants a good serviceable vehicle, which will run smoothly and carry him safely over the road. The harness was just an ordinary leather harness without any nickel mountings or nonsense, made for steady use, not for ornament or parade. In short, the whole turnout, as it moved quietly and simply through the streets, with the owner sitting in it, or as it stood hitched in front of the store or post-office, while he went in for his mail or groceries, was clearly the property of a man who, however great he might become, would never be puffed up with the insolent pride of

wealth, would never cease to recognize in a constituent a fellow-man, or to meet those whose votes he needed readily and frankly. The buggy had not the air of a political trotting-wagon, with room only for one. The vacant seat by Mr. Randall's side looked as if there was always room in it for an alternate or a proxy; if the horse neighed it was a simple American neigh, such as the horse of the humblest man might give without arousing any resentment among the neighbors. Since Mr. Randall's defeat for the Speakership his enemies have unfeelingly taken to deriding the horse and buggy, and to declaring that as the day for the meeting of Congress approached, the horse and buggy were brought more and more into prominence, and became at the same time the worse for wear and tear, as if, the greater the danger of losing the office, the more plain and even shabby was the turnout made, with a view to endearing itself to a wider constituency than ever, until finally we find it described, just before the election of Mr. Carlisle, as a "rickety old concern, drawn by a horse almost as dilapidated"—an animal probably well calculated to give the lie to the slanderers who went about representing its owner to be the tool of the money-kings and monopolists.

All candidates might of course have a horse and buggy, but they do not. Some use one thing, and some another. The simplicity of Mr. Blaine's character and tastes, for instance, and his plain democratic standard of life, and his consequent fitness for the Presidency, are shown just now in a most effective way by the press accounts of his house and habits. For the former he has taken—rented, we believe—not a big mansion, in which to give banquets, but a small, unostentatious frame residence, in the neighborhood of the White House and not far from the British Legation and other costly dwellings, and in marked contrast to them; and through the windows of this little home he may, to judge by what we hear, be seen any morning seated at an unpretentious study table engaged in historical composition, the very picture of a man qualified for the lofty station which his character forbids him to seek. Every one who has read the biographies of future Presidents knows that, no matter what their financial condition may have become, their career began in an unpainted log cabin, a picture of which always helps to illustrate the volume. If Mr. Blaine were to be nominated for the Presidency, there can be very little doubt that he too would appear to have been born in this nursery of statesmen, and it is very likely his recollections of the simple, unpretentious cabin that make the frame house now so congenial to his tastes. It is at any rate a sort of preparation for the cabin and the White House at the same time.

Mr. Holman, another prominent newspaper candidate, appears to be qualified for the race in the same way. In his case it is, we believe, chiefly his dress and manners which denote his perfect simplicity of mind and heart. He wears plain and inexpensive though perfectly neat clothes, thin in summer and thick in winter, and probably, when cold, warms himself with plain hot air from a plain register with no "frills" about it. He uses plain, direct, and simple language, the language of a man who has no private ends to serve. It is pleasant to think that the one trait which an approaching canvass brings out in all our candidates, of whatever party, is simplicity—a sort of rural or early Christian simplicity and directness which recalls the exhortation of St. Paul: "Seeing we also are compassed about with so great a cloud of witnesses, let us lay aside every weight and the sin which doth so easily beset us, and let us run with patience the race that is before us."

THE LOBBY AND ITS CURE.

An attempt to ameliorate the lobby nuisance will, it is said, be made this winter by excluding from the floor of the House of Representatives the little knot of ex-members who, as such, have the right to appear there and lobby. According to the grave and accurate explanation of this practice given by those who desire to break it up, the origin of the right of the ex-member to ply his trade in the House may be traced to those remote times when the office of a member of Congress was considered one of honor and dignity. It was then regarded a proper mark of respect to the office to give ex-members the privilege of the floor. In course of time, however, as the honor and dignity of Congressmen declined, and the business of lobbying became more profitable, this privilege became a valuable pecuniary right, so that now men get themselves elected to Congress in order that, after they have served their time out, they may make a living by button-holing Congressmen about bills, the office of member being actually a stepping-stone to that of lobbyist.

There is certainly nothing to be said against the proposal to lessen this nuisance by withdrawing the privilege of the floor from ex-members altogether. But it could only have a very slight effect in abating the lobby itself. For this purpose, nothing has yet been found very effective anywhere, though almost every sort of treatment has been tried in the State capitals, where the lobby problem is the same in kind, though not in degree, as at Washington. One means resorted to has been the restriction of special or private legislation by constitutional amendment, the effect of which may be seen in this State in the marked reduction of the annual volume of legislation. But the lobby at Albany is still powerful and well organized, and, within the limits imposed upon it by law, does its work very effectively. Some reformers have proposed—and in one or two States we believe the proposal has been acted upon—to make lobbying a crime, punishable by incarceration in the penitentiary; and the statute-books of all the States abound with enactments directed against bribery and corruption, designed to make the way of the lobbyist hard. In Massachusetts some effort has been made to regulate the practice before committees. A suggestion of an approach to the English system, under which the proceedings in relation to private bills are made as nearly like proceedings in court as possible, was to give all interested full notice of the proposed legislation, and an opportunity to be heard, for and against. In England the Parliamentary bar, as it is called, which corresponds to the lobby with us, is a creature of law, or of Parliamentary regulation which has the force of law, and the introduction of the English system has often been recommended here, particularly at Washington, as likely to have an excellent effect. Thus far Congress has manifested no evidence of a desire to make this change, or of any appreciation of its importance.

The fact appears to be, therefore, that there is little reason, judging from our past experience, to expect much from such direct attacks upon the lobby. The visible and material lobby, with its Bardwell Slotes revisiting the "halls of debate" in the interest of profitable jobs, is but the external sign and indication of a widespread disease, which comes in part from the poverty of a large proportion of Congressmen, the uncertainty of the tenure of office, and the difficulty of finding any other occupation after having once taken to politics, and partly from the vast amount of legislation "with money in it," which now makes up the bulk of the annual business of Congress. Whatever diminishes this takes off some of the pressure of the lobby from Congress; whatever improves the tone of the class from which Congressmen come strikes at the root of the evil. This amounts, of course, to saying that the work of making the relation between Congress and the agents of private interests affected by legislation what it ought to be and what it might be, must be a slow and gradual one, and that the idea that it can be accomplished at one stroke, by some single statute, or constitutional amendment, or change of Congressional procedure, is a mistaken one.

As an illustration of the effect of taking away business from Congress, the Court of Claims shows what may be done. All the business now transacted by lawyers and judges in this court, in a respectable, orderly, and pure way, was a short time ago in the hands of the lobby, and was affected by all the worst influences the term suggests. This branch of the work of reform would be made complete by the transfer of all claims against the Government to the courts. Bills for this purpose have been pressed in Congress, especially by the late Mr. Clarkson N. Potter, but nothing has come of them thus far, Congress being reluctant to part with all control over this seductive branch of public activity. Sooner or later, however, the control over claims must be relinquished. No other modern parliamentary body in any civilized country has retained it to the extent ours has. In the same way the simplification of the tariff will shear the lobby of much of its strength, as every article removed from the list will make one piece of lobbying every winter or so unnecessary.

The withdrawal of patronage from members of Congress will, of course, affect the lobby, because it will enable them to give more time and attention to their legislative duties, and must raise in the course of time the general level of the whole political class. Members of Congress evolved by a machine like that which evolved Conkling and Platt in this State, for instance, would in the natural course of things hardly look upon the lobby

with disfavor. Men elected without this kind of evolution would.

THE PRINTERS AND THE PRESS.

We publish elsewhere a well-written letter from a member of Typographical Union No. 6, which is now carrying on operations against this office, stating the case of the printers as against employers in this city. We may begin by disposing at once of all he says touching the low rate of wages received by printers in New York, which he puts forward as the main justification of the strike. He alleges that the average rate of compositors' wages has been $12 a week, which is low, whether we judge it by the cost of living or by the profit of the publishing business, or by the wages paid in other fields of la bor. To this we answer, that this may all be true, and yet does not in any way affect the controversy between the *Evening Post* and the strikers, because the average rate of wages paid in this office, during the past nine months, proves by actual examination of our books to be $19.81. According to the admission of the strikers before they left, their average pay was $19, which we maintain, as an average rate, is high, judged from any point of view, and, at all events, is nearly double what Mr. O'Flaherty complains of as low. It is a rate, too, paid for agreeable work in a comfortable and well-lighted composing room during a day of nine hours, beginning at 8 A. M., and accompanied by a certainty of permanency for all competent men. Four compositors left this office last spring after more than forty years' service; some among the recent strikers had been here over twenty years, and we doubt if any of them will say that they received while in our employment anything but courteous and considerate treatment.

We freely admit, however, that whether this rate of wages paid by us was high or low, whether the work for which it was paid was agreeable or disagreeable, the compositors had a perfect right, either singly or collectively, to ask for more, and, on being refused it, to strike—that is, to refuse to work for us any longer on our terms. If there be an inalienable right, it is the right to refuse an offer for your labor or for any other commodity which you do not think is sufficient, and to seek a better market elsewhere. The complaint we make of the conduct of the strikers is, that they sought before going to coerce us into paying them what they asked, by intimidation—that is to say, by seeking to inflict serious damage on our property in suddenly and without notice leaving their work, with the design of preventing us from keeping our contracts with our advertisers and subscribers by stopping the issue of the paper. This is the sole object and meaning of the practice of suddenly striking a short time before the hour of publication. Committed against a newspaper, it is an offence not far removed, morally, from smashing a clock with a hammer in a watch-maker's store because he will not let you have it for less than $12, when you are only willing to give $10. It has, however, a worse side than this. When a man enters into any contract with a fellow-man on which he bases business or domestic arrangements, and which he has done nothing to abrogate by misconduct on his part, a sudden failure to fulfil it, with the design of injuring him or compelling him to submit to a new demand, is one of the basest acts of which the member of a civilized community can be guilty, even if it may not be made a criminal act by law. In its grosser forms it is called blackmail, but, by whomsoever committed, whether employer or employee, printer or publisher, bricklayer or merchant, it is indefensible and socially degrading. Of this act we were made the victims by men to whom we had done no wrong whatever in mind, body or estate, and from whom we asked nothing except the liberty to regulate the cost of carrying on our own business. We do not know by what sort of arguments such conduct is defended at meetings of the Typographical Union. Whatever they are, Mr. O'Flaherty has not ventured to produce them in his letter.

Of the gross attempts to intimidate the new men who accepted our terms afterward, and to damage our property, after getting admission to the office on false pretences, we shall not say much because Mr. O'Flaherty does not seek to defend them. But when he tries to repudiate the responsibility for them on the part of the managers of the Union, we shall only say that when we arrested one of the disturbers in the act, he at once sent word to the President, who was apparently waiting for him outside. Since then daily efforts continue to be made to seduce people from our employment, not by the ordinary arts of persuasion, but by false representations of every description, including threats. Within three days an attempt has been made by the President and Secretary of the Union in person to induce our foreman to convert the office once more into a Union office; and it was enforced by the assurance that they would either make it so or "bust up the *Evening Post*." All this is interesting to us now simply as an illustration of the manner in which the Union is managed, and of the character of the rule to which so many highly respectable men submit their conduct in the ordinary business of life. The offer made by Mr. O'Flaherty to pay the damage done us out of the Union funds, can hardly be sincere, because he has apparently no authority to speak for it.

We, for our part, are determined to have no relations with it or with anybody belonging to it, for the simple reason that we will not deal in business with anybody who is not a free agent, or who cannot make his own contracts, or keep them when made, or who is likely to be controlled in any business transaction by somebody outside, whom we do not know or cannot trust. Ours is neither a Union office nor a non-Union office, but a man-to-man office. Moreover, we have now been informed more than once that the control of the *Evening Post* is necessary to the Union as an aid in its movement against the morning papers, which it is apparently determined to force into paying 50 cents. This constitutes another reason of the strongest kind for avoiding all relations with the managers of the concern. The business of this office is the regular and punctual publication of an evening paper, and not participation in attempts to raise or lower wages in other offices, or to regulate the affairs of other publishers. We freely concede Mr. O'Flaherty's claim that the printers ought to exert their due influence on the press. Every honest and honorable man, who fulfils his contracts, gives every one his due, and does as he would be done by, ought to have an influence on the press. Every printer who is such a man ought to share with all other such men in making the public opinion by which the press is or ought to be controlled. But in the character of an intimidator, or blackmailer, or coercionist, a compositor is entitled to no more influence than other persons of the same class. The arts by which attempts are being made by the Typographical Union to subjugate the press of this city are not the arts of honest men, but criminal arts, and it is, therefore, the duty of all honest men to resist them.

THE GREEKS AND THEIR STATUES.

To the various serials now in progress Messrs. Calvary & Co., of Berlin, have added the *Berliner Studien*, under the editorship of Ferdinand Ascherson. Its double province is philology and archæology, and the two departments are represented each by one paper in the first half volume. The first article is an elaborate discussion, by Dr. Wilhelm Gemoll, of the sources, authorship, and time of the 'Geoponica.' The last edition of the 'Geoponica' dates from 1781, so that it can hardly be counted among the popular books; and yet of all the technical treatises of the ancients, the agricultural are among the most attractive for moderns. We Americans are not dead to the feeling, and only a few months since an "officer of the United States Treasury Department" published in New York 'Hints from the "Works and Days" of Hesiod, dedicated to the Husbandmen of America. The bits of folk-lore, the curious items of natural history, the side-lights falling on social relations, requite even the non-bucolic mind for the toil of plodding through much wearisome stuff; and this very collection of agricultural tracts, the 'Geoponica,' is the subject of a study by the French scholar, De Raynal, in the *Annuaire de l'Association pour l'encouragement des Études grecques en France* (1874). But Dr. Gemoll has not been tempted by the example of his predecessor into any effort to make his treatise popular, and we can only give the conclusions which he has reached as to the time and the authorship, or rather compilership, of the 'Geoponica,' which he brings home to Cassianus Bassus Scholasticus. This is nothing new; but Cassianus Bassus Scholasticus passed hitherto for a Christian gentleman of Bithynia, and Gemoll has ruthlessly robbed him of even those little bits of color. The 'Geoponica' was put together between 944 and 959 A. D.

The other article in the *Berliner Studien* is much shorter. Dr. Gemoll takes up nearly three hundred pages in his investigation. Dr. Kuhnert tells us in seventy what he has found out about the care the Greeks took of their statues. The information has been gleaned chiefly from inscriptions, and it is somewhat amusing to notice the truly Teutonic shiver with which the author contemplates the steady increase of new material which will, in a short time, make his essay "antiquated."

The erection of statues was intrusted in Greece to what we may call a Board of Public Works. It was an unpaid commission, which had to contract with an artist, and whose aim was to get

the most art for the least money. The statue was inspected on delivery. If it was approved it was erected on the appropriate spot. Milo, the famous athlete, who had that inarticulate sense of humor characteristic of strong men, carried the statue voted to him on his shoulders to the Altis of Olympia. The modern joke would have been to carry the bill that voted it. To the American mind, opportunities for jobs would seem to be suggested by many of the details. The members of this board were, it is true, among the first citizens, were often the highest magistrates of the place; and when a man had a statue voted him he felt himself much more honored if the procurement of the effigy was intrusted to the chief potentate of the city than if it was committed to a private individual. When Greece became poor the practice of voting statues did not stop. Only, as we learn from Dion Chrysostomus and others, they had a very shabby way of changing the inscription of an old statue. In such cases the most exalted commission conceivable was doubtless employed, to the great delight of the gamins of such cities as Rhodes.

After the statue was safely in place, the next thing was to look after the preservation of it; and statues, in a country where there sometimes seemed to be more statues than men, were exposed to many risks. Sometimes the ornaments were stolen, sometimes the statues were carried off bodily. So in Chios a band of thieves conveyed the statue of their patron god, Hermes, and the fact was jocosely recorded on the base. The gods were theoretically supposed to protect their own statues. The statues of private individuals were not so safe; but the only instance, so far as is known, in which an appeal is made to the public "not to touch the figures," is made by a woman. In all other cases, the inscriptions show that the Greeks believed more in round cursing than in plaintive petition. The legal punishment for mutilating or otherwise injuring a statue, especially that of a deity, was very severe. Even the pranks of childhood were not forgiven, and no one who has read Pausanias can forget the story of the children who found a piece of rope as they were playing about the temple of Artemis, and proceeded to strangle the statue of the goddess in fun, for which they were stoned to death in earnest. It is but fair to say that this summary process was not approved by the highest religious authority of Greece.

Men might be reached by curses and punishments, but jackdaws would steal gold, swallows would commit trespass, spiders would spin their webs as actively and as remorselessly as they do in modern times, and mops and brooms were the only remedy for the desecration. Against earthquakes, an ever-present factor in Greek calculations, nothing was to be done, as Dr. Kuhnert wisely observes. The original office of the temple was to shelter the statue, and even when the *cella* was partly open to the air the statue was under cover. Trees, at first connected in some way with the worship of the deity whose effigies stood beneath them, became in time favorite shelters for images profane as well as sacred, and formed admirable contrasts to the gleaming colors of the statues. Wooden figures being especially perishable, and often especially sacred, needed especial protection from the inclemency of the weather. They were painted, and oiled, and gilded, and at least treated every now and then to a wash in lye-water—the soap question being still in dispute. Marble statues had to run their own risks, and could only be cleaned from time to time. Bronze statues were protected by bituminous coating. Chryselephantine figures required especial care, differing according to the locality. The same rule would not apply to Athens and to Elis.

Dr. Kuhnert next tells us who took care of these details of service, and adds an interesting chapter on the honors shown to the statues—honors which survive in substance to the present day. Immortelles are not dead, and the *bambino* is paraded in Italy as Pallas was in Argos.

THE CORRESPONDENCE OF CHARLES DE RÉMUSAT.—II.

PARIS, Nov. 22, 1883.

CHARLES DE RÉMUSAT was, in his earliest youth, enamored of politics as well as of literature and of society. His letters to his mother, written in 1815, give an opinion on all the questions of that time; he follows all the debates of the Chambers; he speaks of the Ministers with a sort of familiarity: "I will take the liberty to say to my father that I don't want a law to suspend, for a year, the irremovability of the judges." It is rather singular that the Third Republic, in 1883, has done, in this question of the irremovability of the judges, what the Government of the Bourbons did in 1815. Rémusat sees the humorous side of things; he laughs at M. de Colbert, "who thinks himself a legislator because he has made a proposition to substitute in the *Code Civil* the words *procureur du roi* for those of *procureur impérial*." This young man—this child, as his mother calls him—is extremely precocious, and his mother writes to him as if he knew everything. Mme. de Rémusat had evidently taken Mme. de Sévigné as a model. She writes to her son: "When my malady of the century of Louis XIV. seizes me, I think you remind me of the Marquis de Sévigné. You are, as he was, gay and natural; a little weak, also, are you not? And you love your mother as he loved his. I will not push this comparison too far, as you might think that I am capable of giving myself too fine a place. God forbid, my child, that I should be so disrespectful to my friend!" She always calls Mme. de Sévigné her friend—the friend.

Mme. de Rémusat owed much to Talleyrand. She hoped that the great diplomat might be of use to her son, and she gives Charles directions with a view to pleasing the fastidious statesman.

"Are you still timid with him? You can unbosom yourself; you have tact, and will not go too far. What he likes better than anything is the *naturel*. He has a very fine scent for the smallest trace of affectation in others, and I never succeeded otherwise than by letting myself go, without choosing my words. Generally, in conversing with him, you must take things largely (*en masse*), hear well and quickly, give occasion for speaking, let fall all you want to say, and what you do not want to be discussed approve with a smile and a look—he is extremely sensible to that. Let approbation and affection pierce without making a show of it, for in his place one does not like strong emotions."

All this is said with the greatest delicacy, and is almost untranslatable. "If you understand something of all this *galimatias*," she adds, "you will be clever." Clever he surely was: he was one of those men who are at twenty what they are at fifty; who do not develop, but flower at once, and of whom it cannot be said,

"Et les fruits passeront les promesses des fleurs."

It is most extraordinary to see this young man of nineteen discussing every possible subject—presumptuous, as all young men are, but really capable of forming and of expressing opinions: witty, ardent, and cool at the same time; worldly, yet capable of judging the world; conducting his own life, as it were, from the outside. It must have been a great pleasure to Mme. de Rémusat to have such a charming and intelligent correspondent in her son; at the same time, her letters are sometimes so perfect in form, and touch upon so many points, that it seems to me that they were written in order to be read (at least in some parts) in some of those select circles where young Rémusat was received. The mother, in this way, helped the son even at a great distance: she contrived to make his friendship desirable, as his friendship involved communication with the most agreeable of mothers.

There is, at times, a singular freedom in this correspondence between a mother and a son. There is nothing to object to when the son only says such things as these, in giving an account of a party at Mme. Suard's (Suard was a member of the Academy, and Mme. Suard was well known for the levity of her conduct): "The good lady comes straight to me and says, with all the expansion which you know, 'Sir, you cannot imagine how much pleasure I have in looking at you . . . !' and there she stopped, and so did I. Fortunately she added: 'It is because it seems to me that I see madame your mother.'" But there are other anecdotes concerning the Suards which are most improper—so much so that I cannot cite them here. The tone of the eighteenth century, which was the tone of Mme. de Rémusat, admitted much liberty, but this liberty did not go so far as to allow a mother to encourage a certain sort of levity in her son, and to hear too much of his love affairs. "You tell me to amuse myself," says the son to the mother. "You are afraid that the monotonous spectacle of politics will make me sad. You are mistaken; politics alone are amusing, and if sometimes they have a sorrowful side, the ridiculous side is there to console me." There are some letters in the correspondence which have really given me pain, and which ought never to have been published, as they ought never to have been written. They make real blots in an otherwise charming book. How much we prefer Mme. de Rémusat when she allows her pen to run on ordinary subjects. "You lose yourself in great speculation, my child, while my politics are very *terre à terre*. I always think that the advantages (or the inconveniences, if you like) of civilization will save us, and there is always some resource in a country where everybody goes home to dinner and to bed." "I see in a newspaper that they announce at the circus a melodrama called 'Clarissa and Lovelace.' Good God, what are we coming to! Are they going to put my friend Clarissa on horseback, and will Mme. Franconi represent her part? Do try to act on the police, and to make them oppose such things. If Clarissa is profanated, there is nothing sacred left in the world. I will sell my estate at Lafitte and go to Brazil." The correspondence is full of such small "nothings," as the French say.

On the 13th of March, 1816, Charles de Rémusat was nineteen years old. He found himself old already. "I don't know much for my age; still, I know too much; I have discovered everything. There is no mystery, nothing unknown, for me." He was studying chemistry with the famous Thénard, and law at the law school; but he was especially studying the world. In literary matters, Mme. de Rémusat was his counsellor, and he could hardly have had a better one. She did not much like Voltaire, having been brought up in Rousseau's school of *sensibility*, but she did appreciate Voltaire, and she judged him thus:

"You are not without a disposition to imitate Voltaire. There will be no harm in this if, while you speak as he does, you take care not always to think like him. The *dénigrement* of Voltaire would have dried up his mind, if his mind had not been genius. The habit of satire sours the thought, pardon me the expression . . . . Still, I am not sorry that you have somewhat imbibed Voltaire's modes of expression: his letters are a model, and nobody possesses as much as he the advantage of an unexpected contrast between a light form and a solid ground."

She was passionately fond of Mme. de Sévigné; she liked the Jansenist writers, such as Nicole, the great moralist. Charles's criticisms on current literature were often good. Speaking of 'Mademoiselle de Clermont,' a novel by Mme. de Genlis, he says:

"I have been a little hard on 'Mademoiselle de Clermont.' It is well written and there are some fine and true reflections. But it smells of the world, and by the world I mean the *salons*, and even the *salons* of a certain epoch. The grace of Mme. de Genlis is the grace of a lady in hoops, in a damask room, near a toilet-table covered with powder. It has no *naturel*, no depth; and this is what I demand. The style is pure, but without character, without life. There are a thousand new things in Mme. de Staël, and, notwithstanding her follies, her barbarous style, it is an occupation to read her."

This is a very good appreciation, and generally Charles's remarks on literary matters show much taste and delicacy. His political judgments are inspired by a sort of a vague and generous liberalism, very natural in a young man. He saw the excesses of the Restoration, and felt the ridiculousness of the school which professed to be more royalist than the King; he also perceived the dangers of the Gothic, aristocratic, and ultramontane doctrines, knowing that there was a strong undercurrent of revolutionary and democratic doctrines which would some day make its influence felt. His mother was a pure royalist at heart—as much as she could be anything; she had been in the court of the First Consul and in the court of the Emperor; but even there, among the upstart marshals and their wives' in the midst of the Jacobins converted into senators, she had represented the ancient régime, its good manners, its traditions, its pride and impertinence hidden beneath wit, elegance, and grace. M. de Rémusat, who was a stolid and practical man, was now a Prefect, and officially a representative of the men in power; so Mme. de Rémusat often tried feebly to defend the measures of the men attacked in her son's letters. But her defence was hardly sincere; she was in reality very much in the state of mind of Talleyrand, who was her great admiration, and whom she familiarly always calls "mon curé." Talleyrand was a great aristocrat, who profited by every government as well as he could. His instincts did not blind his judgment; he hated at heart the new order of things, but he did not wish to be kept out of it. Mme. de Rémusat makes me always think of a girl of high birth, who has married a rich commoner and tries to be on good terms with all the members of her new family. She had really no political doctrine, and, though her son was often pedantic, he never became a doctrinaire of the style of Royer-Collard or Guizot. He was too elastic, too indifferent, too much of a sceptic. But we must be just to him: his scepticism had nothing to do with egoism. His good taste did for him what virtue or principle does for others.

Charles de Rémusat saw very clearly, in 1816, what would be the effect of the action of the ultra-royalist party. "When they reach the goal of their desires they will be very much astonished to see their own work. It will be found that the men who wished to destroy constitutional government have worked with those who wish to establish national chambers [which must be distinguished from representative assemblies]." In short, he saw the coalition of the Bonapartists with the extreme royalists in preparation, and this coalition proved fatal to the cause of hereditary monarchy. England was his ideal, and he remained English to the end of his life. I remember well seeing him, during the days of the Second Empire, on an English common, watching with the greatest attention young men who were playing cricket. I asked him if he was studying the rules of this somewhat complicated game. "No," said he, "but I was thinking that even cricket is perhaps necessary to constitutional government." His conversation was delightful, and, if it had a single defect, it was that he was somewhat too fond of arguing. If you had an opinion, he had another. He always saw spots on the sun; he was fond of shades, of limitations; he disliked anything excessive. All these qualities or defects, as you choose to call them, are already developed in his correspondence in 1816. At the very moment that I finish these lines, a second volume of the correspondence is coming out. It will be followed, I am informed, by others. The first volume has met with so much success that the publisher is pressing M. Paul de Rémusat to continue his work as rapidly as possible.

Correspondence.

SERGEANT MASON'S EMPLOYMENT.

To the Editor of The Nation:

Sir: Your statement in the *Nation* of Nov. 29, 1883, in regard to the employment of Sergeant Mason by a firm of clothing dealers in this city, is so incorrect, and your inference consequently so groundless—no matter what the state of the dry-goods market may be at large—that it calls for correction. The fact is in this case that the firm made the contract with Mason very soon after his attempt upon the life of Guiteau.

I would not venture to call your attention to so small an error if long reading of the *Nation* had not bred in me the same dislike of inaccuracy which the paper so uniformly practises.

Respectfully, Elbert Wing.

Chicago, Dec. 3, 1883.

MR. BLAINE AND THE FATHERS.

To the Editor of The Nation:

Sir: In the discussion of many financial problems, the statesmen of Mr. Blaine's school and the protectionists in general refer to the testimony of the fathers as a final tribunal. It may not be uninteresting to the readers of the *Nation* to see what the opinion of two of the fathers, at least, was about such plans. Below will be found quotations from Henry Clay, the "Father of the American System," from Daniel Webster, the "Defender of the Constitution," and from Jefferson.

On the 28th of January, 1841, Mr. Clay made a great speech "On the Distribution of the Proceeds of the Public Lands." He favored such distribution, and therefore is not an enemy to distribution in itself. In the course of his argument he says, in reference to the constitutional power of the Government to tax:

"There is, then, I repeat, no power or authority in the general Government to lay and collect taxes in order to distribute the proceeds among the States. Such a financial project, if any administration were mad enough to adopt it, would be a flagrant usurpation." (Clay's Works, vol. vi., p. 233.)

This is rather hard on Mr. Blaine, but these words do not come from a party enemy; they are the words of the "Father of the American System," to support which Mr. Blaine has devised his scheme.

Mr. Webster, in his speech of May 31, 1836, "On the Distribution of the Surplus Revenue," favored that proceeding as a single instance, an exception to a general rule. He says:

"There would be insuperable objections, in my opinion, to a settled practice of distributing revenue among the States. It would be a strange operation of things, and its effects on our system of government might well be feared. I cannot reconcile myself to the spectacle of the States receiving their revenues, their means even of supporting their own government, from the treasury of the United States."

Further, Mr. Webster approved of the continued distribution of the proceeds of the land sales, provided they could be kept separate; "but," he continues, "if we cannot separate the proceeds of the lands from the other revenue, if all must go into the treasury together, and there remain together, then I have no hesitation in declaring now that the income from customs *must be reduced*. It must be reduced, even at the hazard of injury to some branches of manufacturing industry; because this, in my opinion, would be a less evil than that extraordinary and dangerous state of things in which the United States should be found laying and collecting taxes for the purpose of distributing them, when collected, among the States of the Union."

Mr. Webster, it is to be remembered, was at this time an earnest protectionist. His willingness to abandon in some measure the protective duties emphasizes most strongly his disapproval of any plans like Mr. Blaine's; and yet he was not opposed to all distribution. In fact, both Webster and Clay favored the distribution of '37, and the distribution of returns from land sales, and at the same time had nothing but bitter denunciation of any plan that resembled Mr. Blaine's neat device to get rid of the surplus.

The opinion of Jefferson on this point may be gathered from the fact that he deemed a Constitutional Amendment necessary to make the way clear for national appropriations for internal improvements and education. (See Jefferson's sixth message.) In his second inaugural address, in reference to possible surpluses, he says:

"The revenue thereby liberated [*i. e.*, by the payment of the debt] may, by a just repartition among the States and a corresponding amendment of the Constitution, be applied *in time of peace* to rivers, canals, roads, arts, manufactures, education, and other great objects within each State."

The advocates of distribution do not get over the constitutional objection by affirming that nothing is said against it in the Constitution. It is a first principle that "the Constitution is a grant of powers"; and if distribution cannot be placed under the "general welfare" clause, it is indisputably unconstitutional.

E. G. Bourne.

New Haven, Conn., December 5, 1883.

THE PRINTERS AND THE PRESS.

To the Editor of The Nation:

Sir: In two recent numbers you have devoted editorials to consideration of the morals and methods of the New York Typographical Union. Your positions are not solacing to the unionists, your illation is not always fair, your views are made though an ex-parte telescope, the lenses of which need justifying; and on these grounds we appeal to your integrity and spirit of fair play—which, while we struggle with you, we do not gainsay—to give us a word for the ticket we uphold.

The foundation of unionism is a desire to win and secure justice to the worker. You admit our soundness fundamentally. Every one has a right to justice. But you say our claim for more pay now is unjust. Is it? How are we to judge? Surely by a regard for the cost of living, a regard for the profits accruing from our labors, and a regard for the wages being paid to workmen in other callings. Before action was taken for a rise of pay this regard was carefully had. We knew the cost of living was high; we concluded that publishers were sharing in the great prosperity God is giving the country; we ascertained that carpenters and bricklayers and others, no harder-working, no more skilful, no more industrious than we, were

earning good wages once again, while we were working on the financial level whereto we were thrust down as a sequence of the "Black Friday" commercial crash; and we made up our minds that we had justice with us in our demands, that we were in unison with the indefeasible basis of unionism, and that, therefore, win or lose, we should have, to console us, conviction of effort toward a good end.

It is not difficult to understand why you could not at once grasp the equity of our demands. You were employers worthy the name; our men who labored with and for you were a picked corps: the relations were pleasant, the earnings were good. But these favorable conditions were exceptional. The fact is this, sir, that the average earnings of our book and weekly paper piece-hands in New York city did not foot up more than $12 a week before the strike! This was most unjust. But we can give you, if you will, vouchers for the accuracy of the statement. Publishers were enjoying all the benefits of protection, and all those advantages of unpaid literary effort which the non-existence of international copyright confers, and, with the ineffable magnanimity which is their traditional distinction, were running around from shop to shop seeing how much they could squeeze us down to, under the flat-iron of competition. We pay for protection. They pop all the profits of it into their pockets, plus as much more as they can unconscionably hook out of ours. I submit, sir, you cannot help allowing that our claims, in face of this, were just.

Touching some of your remarks in last Thursday's number, I think issue may fairly be joined. You say the utterances of the press should not be modified in even a small degree by any trade or industry; that an unseen influence over the press by any organization, however respectable or meritorious or enlightened, would be disastrous, and that the demands of the Typographical Union are growing and will continue to grow with each success the Union achieves.

To these advancements my answer, with all deference, is that the press is and must be controlled by every legitimate trade and industry. The *raison d'être* of the existence of the press is that the public will and sentiment may be responded to. When a newspaper ceases to do what its constituents demand, it ceases to exist. We are a portion of the public; our sentiments are an integrant part of public opinion; public opinion rules the press; the press must *nolens volens* be modified in its views by us. As to an unseen influence acting on the press, that is being felt continuously. What does the public know of press writers or those who instruct them? Nothing. The journalist is a literary sailor oft-times. The captain never hauls a rope or handles a handspike or takes a watch in the wheelhouse. He stands up aloft on the bridge, makes his observations and gives his orders, and the vessel takes her course. The passengers down below know nothing of his doings or motives. The unseen influence in journalism is the captain of the ship; the public are the passengers. But the unseen influence we have exerted is not of this nature. It is an unseen influence, however, which shall ever make itself felt so long as the press is in the hands of men who recognize that one of its noblest functions is to champion the just and uphold the weak. It is because our case was a good one that we won a verdict from the journalistic magistracy, and I am sure when the *Nation* recognizes this it will not dispute the meritoriousness of our unseen influence.

As to your complaints of unfair treatment at the hands of our men, there is not a respectable unionist in No. 6—and for the most part we are very decent fellows—who would not rather have lost your office than have won it at a sacrifice of honor; and I am informed that Mr. J. R. O'Donnell (who, by the way, is a working printer, and a first-class one, as well as a good lawyer) has expressed the readiness of the Union to make good every cent's worth of damage any of our men may have done. Nothing of what you complain was authorized. It was independent, irresponsible tactics. It was indefensible.

As to the limits of our demands, they are a fair share in the products of our labors. If we claim more than a just recompense ever, we shall be repelled, and we shall deserve to be. All we want is our rights.

You are not more sorry than we, sir, that our happy relations have been ruptured, and if you cannot concede our demands, we shall hold it a satisfaction to have you concede us honorable men and actuated by common-sense and love of fair play.

EDWARD O'FLAHERTY,
(Card 1754, N. Y. Typographical Union No. 6.)

Notes.

A NEW edition (1884) of 'The New England Medical Register,' revised by Dr. Francis H. Brown, will shortly be published by Cupples, Upham & Co., Boston.

Houghton, Mifflin & Co. will issue this week 'A Study of Longfellow,' being outlines for school use, conversation classes and home study, by William C. Gannett; and 'The Works of Virgil, translated into English verse,' with variorum and other notes and comparative readings, by John Augustine Wilstach.

'Airs from Arcady and Elsewhere' is the alluring title of a volume of poems by Mr. H. C. Bunner, which will be published by Charles Scribner's Sons early in the new year. It will contain Mr. Bunner's recent poetical contributions to the *Atlantic* and to the *Century*, and a selection from the humorous verse he has written in *Puck*, of which he is the editor.

'The World's Christmas Hymn,' which is published for the holiday season by A. D. F. Randolph & Co., consists of a mosaic of selections made by the Rev. Wm. Hayes Ward and Miss Susan Hayes Ward. The stanzas thus strung together illustrate the Biblical narrative of the Nativity in chronological order, and are made to end in an aspiration for a second advent, for the termination of wrong and misery. The collocation is ingenious, and from a catholic range, but here and there the highest poetic criterion is relinquished for the sake of a connecting link. The resulting unevenness is never more plainly felt than when Milton intervenes with a blast like his own "bass of Heaven's great organ." The volume is very tastefully printed, and is provided with notes indicating the source of each stanza, and with reproductions of engravings after the appropriate works of the great painters. The composition employed upon the covers has a rather unpleasant resemblance to certain kinds of stone ware.

All good things have an end, and so we must say hail and farewell to the concluding volumes (xi., xii.) of the Parchment Library Shakspere (D. Appleton & Co.). No more taking series, considering only unannotated editions, has appeared of late years. Each volume can, we believe, be procured separately, and the low price exacted for two or three plays in a single volume would cheerfully be paid for one in such a handsome dress.

Ginn, Heath & Co., Boston, have at last brought out in pamphlet form the much-discussed Inaugural Address of Dr. August Wilhelm Hoffmann, delivered at the University of Berlin, three years ago last October. It relates to the question of a division of the Philosophical Faculty, and in the appendix to the second edition (here translated with the rest) gives two formal opinions on the admission to the University of graduates of the Realschulen, reported by the Philosophical Faculty of Berlin in 1860 and 1880. In these especially lies the ground of debate between scientists and classicists.

'Bryce's Pearl English Dictionary' (T. Y. Crowell & Co.) is not to be compared in fulness, or usefulness, or typographical beauty, with Jenkins's 'Vest-Pocket Lexicon,' which it resembles in excluding the more familiar terms. Being of more recent date, however, it naturally contains words not to be found in a dictionary published twenty years ago. Thus we find Bessemer's process, cerebration, ensilage, to interview, Philistine, to prorate, rococo, etc. It has also lias, but not loess; saurian, but not deinosaurian; durbar, but not tiffin; isothermal, but not isobar, etc. We seek in vain for astigmatism, brachycephalous, collodion, dynamo, trichnosis, etc. Darwinism is defined, but not evolution in the Darwinistic sense. The use of small capitals without accents for the catchwords gives us forms like *protege* for *protégé*. *Entente cordial(e)* is unduly shortened by one letter, and the pronunciation of the former word indicated by "augtankt." The definitions are necessarily brief, but a caucus might have been defined as "a meeting to control" policy as well as "elections."

The "Descriptive Catalogue of Literary Curiosities" just issued by J. W. Bouton offers very exceptional temptations to the amateur of books. The large collection of manuscript missals, of manuscript and early printed Horæ; the set of early woodcuts by Dürer and Jost Amman; the letters to and from Dickens, upward of 300 in number; the MsS. of Tom Moore, including his 'Epicurean' and commonplace note-books; the Shakspere folios; the thirty-seven folio volumes or pictorial scrap-books of London, ancient and modern, and its environs; the collection of Ruskin's works, valued at nearly a thousand dollars—such, in brief, is the extraordinary array which Mr. Bouton sets before the book-buying public.

Mr. W. E. Foster, in his *Monthly Reference Lists* for November (F. Leypoldt), points the way to recent views of Martin Luther (*i. e.*, in publications since 1880), and to the sources of information concerning John Quincy Adams's Administration.

The current Bulletin (July-December) of the Essex Institute (Salem, Mass.) possesses an exceptional interest. We will specify Mr. A. C. Orne's paper on "Popular Errors regarding the Duration of Life," which combats the idea that thirty-three years—instead of fifty—make a generation, and attacks the accepted life-tables; Mr. John Robinson's detailed report of the total contents of an undisturbed shell-heap at Ipswich, Mass., opened last year, and found to contain human bones broken for the stew-pot; and the same explorer's narrative of his discovery of a circular band of porphyry chips marking the site and size of the wigwam of an old Indian arrowmaker in Marblehead.

The current numbers both of the *Publishers Weekly* and of the *American Bookseller* have their customary holiday adornment of plates from the many books advertised in them, and each is a picture-book in itself. The latter is quite the most imposing-looking publication of the kind we remember.

The *Annals of Mathematics*, announced for bi-monthly issue from the University of Virginia, beginning with February 1, 1884, is the successor of *The Analyst*, a mathematical magazine edited and published during the past ten years by Dr. J. E. Hendricks, of Des Moines, Iowa. The new journal, like the old, is design-

ed to be a medium of communication and publication for teachers and students of mathematics. The editors purpose to guide and encourage the study of mathematics, pure and applied, in all its branches, and to stimulate independent matbematical investigation.

The 'Bryant Calendar' (D. Appleton & Co.) and 'A Calendar from John Ruskin' (Boston: L. Prang & Co.)—the latter taking the form of a pallette—are the newest of their kind.

In the number of the *Revue des Deux Mondes* for November 1 is a translation of Mr. George W. Cable's "Jean-ah Poquelin," one of the most vigorous and pathetic of the stories in 'Old Creole Days.' It is translated by Mme. Th. Bentzon, who modifies the title to "Jean Roquelin."

—We have received several additional communications on the subject of senior societies at Yale, but their contents have been anticipated by the numerous writers to whom we have given a hearing. We must now adjourn the debate to the college press itself, if any exists for the purpose of discussing college realities. Meantime, we believe our readers have been enabled to arrive at a tolerably clear appreciation of the nature and extent of the alleged "evil."

—In our review of Dr. Williams's 'The Middle Kingdom' the reference to Tennyson's "cycle of Cathay" seems to have disturbed a correspondent, "A. Z." We ventured to inform the Laureate that a cycle of Cathay is only sixty years. The line from "Locksley Hall," turned into prose, would read:

"Better fifty years of Europe than sixty years of China."

As Dr. Williams's work (vol ii., pp. 69, 146), and almost all books on China, tell us, the cycle of Cathay is a period of sixty years. "The sexagenary circle, the Chinese assert, was contrived nearly three centuries before the time of Yao, (B C. 2637)," etc. The Chinese are now in their seventy-sixth cycle. A reference to Webster, or any ordinary dictionary, will show that the word "cycle" (properly translated from the Chinese) was rightly used in our review. Whatever Mr. Tennyson meant in poetical license, it is certain that the cycle of Cathay (mediæval China) and of the country of the Ta Tsing dynasty is but sixty years, and that Europe's half century is not so much "better" than China's three-score years, after all. It seems evident, judging from the cautious manner in which France is moving in Tonquin affairs, that Frenchmen understand the line in the exact prose sense, and realize the poetical exaggeration lurking under the bombast of the lover in "Locksley Hall."

—Professor Blackie's 'Wisdom of Goethe' (Scribners) will doubtless serve its purpose of introducing the great thinker to an English-reading public. Even our German connoisseurs will not be sorry to see so many familiar utterances in a new garb. The "list of citations" appended to this (American) edition will facilitate the comparison of original with translation. As to the merits of the selection, opinions will naturally differ. No selection from so diversified an author can satisfy everybody. We need only give it as our opinion that Professor Blackie has been methodical and judicious. On the other hand, we protest against his "Estimate of the Character of Goethe," which is prefixed by way of introduction. Formerly, Englishmen (and Scotchmen) considered it their duty to attack Goethe. Now they all defend him, and the defenders are more harmful than the assailants ever were. They belittle the man by treating him as if he were the hero of one of Thackeray's novels, say Arthur Pendennis. They go through the entire *chronique scandaleuse* of his love affairs, and flatter themselves that they have done wonders if they can only extort under each count a verdict of non-proven, or of mitigating circumstances. To begin with, the procedure is interminable, and then it misses the main point. Goethe never defended himself, he only replied to his detractors: I am a man of the eighteenth century. Don't waste your time over my faults, but profit by my experiences. If you of the nineteenth century are wiser and better, be thankful. We can only regret that Professor Blackie should not have perceived this guiding policy of Goethe's and followed it. Where there is such wealth of wisdom to repay study, why spoil one's temper and waste one's time over the Friederikes and Lottes, Lilis and Christines?

—About a year ago (see the *Nation* for Sept. 7, 1882) we noticed a pamphlet by Prof. Paul Frédéricq, of Liége, upon instruction in history in the German universities. The same intelligent observer has this year published 'Notes et Impressions de Voyage, touching "l'enseignement supérieure de l'Histoire à Paris."' The first thing that appears to have struck him is the number of courses in history at Paris—no less than fifty—while the largest number in any German city (Berlin) was twenty-six. Of course, this is to be explained by the fact that the higher education is in a great degree centralized in Paris. Probably, if the two countries were compared, Germany would have the larger number. Indeed, those of Paris are divided among five independent institutions, which are considered in order: the Collége de France, founded by Francis I., an institution with very little life; the École des Chartes, founded in 1821, the seat of a very thorough study of documents, in which it has no rival, even in Germany; the École Normale Supérieure, founded in 1808, and at present under the direction of the distinguished M. Fustel de Coulanges; the École Pratique des Hautes Études, founded by M. Duruy in 1868, and, apparently, the most active and vigorous of all; and, lastly, La Faculté des Lettres. In his concluding remarks, Professor Frédéricq speaks of the lack of system and the waste of power in these numerous disconnected courses, in which sometimes the same professor gives instruction in two institutions. A movement to concentrate these scattered forces is now in progress, with good results; the nature of it is not minutely explained, but it appears to emanate from the Faculté des Lettres. The discussion closes with some observations upon the excessive amount of detail which enters into the examinations, and the too great generality of the subjects—evils which, however, are recognized by the persons in charge, so that there is every likelihood that they will be corrected. This paper, like that upon Germany, is full of interesting personal notes and reminiscences in relation to the several professors, especially valuable in illustrating their methods of teaching.

—In our recent review of Kayserling's 'Moses Mendelssohn' (No. 957 of the *Nation*), we alluded to the antithetical characteristics of the author of 'Phädon' and 'Jerusalem,' "who was at once a bold philosophical thinker, a literary reformer, and a sincere Talmudist Jew." In our explanatory hints we referred to the period in which the friend of Lessing lived and acted, an age "in which liberal thought pierced through all restraint, while the practice, in state and society, was all but mediæval." That our explanation, which we offered as only partial, was very far from fully covering the enigma, appears from the biography now lying before us of another Jewish thinker, who happened to be born exactly a century after Mendelssohn—in 1829. Lazarus Geiger, to whose life and "theory of the origin of language and reason" Ludwig A. Rosenthal has just devoted an extensive memoir (Stuttgart), was fully as bold in his theoretical speculations as the Berlin philosopher—being, in fact, one of the few evolutionists who have a claim both to originality and thoroughness, side by side with Charles Darwin himself—and yet remained to the last (he died in 1870) warmly attached to the observances hallowed by Jewish traditions. He was, as a thinker, devoid of the least inclination toward superstitious sentimentality, but, like Mendelssohn, found it perfectly in accord with his philosophy to foster, in the ethical interest of the mass of his brethren in race, a reverence for practices of a mixed national and religious character, which had grown up in a long process of historical evolution, and, in his opinion, demanded no belief in any dogma whatever. This view was originally Mendelssohn's. The practices were to lead to the abstraction of moral conceptions and maxims, without fettering reason or excluding continued development. It is well known to those familiar with modern Jewish thought, that this has been the guiding idea of many a late "moderate" reformer within the Synagogue. That a man like Lazarus Geiger, whose bent of mind was purely and radically scientific (and who, by the by, was no relative, at least no near relative, of the famous rabbi and Bible critic, Abraham Geiger), should have clung to it in a time of revolutionary upheaval in science, state, and society, is a phenomenon which finds its explanation in great part in the retired, quiet life which he led from his cradle to his death, mostly in the house of his pious parents, in Frankfort, who survived him. His whole career, which strongly reminds one of Thomas Buckle's, may be summed up in these words: He studied, thought, wrote a few eminent works, and died. Herr Rosenthal's biographical narrative is written in a spirit of reverent admiration, but is almost entirely devoid of anecdotal details, though he drew his information, in addition to what he found in Dr. Bärwald's and Peschier's monographs on Geiger, from some intimate friends of the latter. The main part of the book is a condensation of Geiger's evolutionary doctrine.

—Dr. Friedrich Kapp has for some time been engaged, at the request of the German Booksellers' and Publishers' Association, in collecting the material for an exhaustive history of their trade, and takes occasion in a contribution to a recent number of the Berlin weekly, *Die Nation*, to supplement the flood of books and pamphlets on Luther by an interesting discourse on Luther as the originator of German popular literature, and his relation to the printing and publishing trade, from which we extract the following. Gutenberg's art, at the time of Luther's first public appearance, although for two score and ten years actively cultivated, had had little influence upon the people at large. Printers and booksellers had confined themselves to catering to the needs of the learned professions and the monasteries. Latin was their language, which the general public did not read. German printed books there were really none, excepting a few medical quack books, satirical tales, and poems. According to Panzer's 'Annalen' there were, in 1513, 35; in 1514, 47; in 1515, 47; in 1516, 46; in 1517, 37 publications in the German language. Humanistic literature reigned supreme until then in Latin, which was considered a more aristocratic language, keeping off the *profanum vulgus*. But Luther was, in the greatest period of his career (1517–24), the democratic agitator, and as such had to rely on the mass of the people for the victory of his cause. Therefore he wrote in German, and in

what sort of German! His language is more captivating, thrilling, and overpowering than that of any other writer—a language, too, which he actually first called into existence. From Luher's appearance, therefore, *German* literature dates, and the number of German prints increases. In 1518 there are already 71; in 1519, 111; in 1520, 208; in 1521, 211; in 1522, 347; in 1523, 498 German prints in the language of the people. The small place of Wittenberg in a few years becomes, mostly through his literary activity, the most important publishing centre. His own name appears in print, from 1518 to 1523 (aside from new editions or unlawful reprints), 20, 50, 133, 40, 133 times respectively, and in the last-named year as often as 183 times. Four-fifths of the 498 German books of 1523 are Lutheran in tendency, against a score only of Roman Catholic prints. The Papists complain bitterly of the inability of getting a hearing or finding publishers for their writings. Until Luther's time most books had been dear and stout folios; he introduced the democratic pamphlet, the cheap 12mo and 8vo, thus giving the art of printing its real importance, and securing for his work a thousand-tongued herald which no propaganda by word of mouth could have supplied.

—Luther reformed the book-trade no less than the Church. The editions of the Church fathers and classics disappeared as if by magic. Froben, the famous publisher, failed to sell, at the fall fair at Frankfort, a single copy of St. Augustine's 'De Civitate Dei,' until then a current article sold in numerous editions; while not enough copies of Luther's books and pamphlets could be printed. At one time all the presses in Basle were engaged in printing Luther's pamphlet on marriage. At the Frankfort fair in 1518 his disputation with Eck was sold to the extent of 1,400 copies, and of his address "To the Christian Nobility of the German Nation" 4,000 copies were taken up from August 15th to 23d, 1520. Of the German New Testament of 1522, the so-called 'September-Bibel,' the first edition (which is now being reproduced in facsimile by Mr. Grote of Berlin) of 5,000 copies, although costing about $6 of our money, was exhausted in three months, and two firms at Basle and one at Augsburg were simultaneously engaged in reprinting (pirating) it. The enthusiasm with which Luther's books were received, sustained and fostered his literary activity. The demand for printed reading matter constantly increased among the people at large, who were not quite so uneducated as they are often represented by later writers. John Faber of Constance writes to a friend that through the complicity of the printers the unlearned already knew (1521) of Luther's doings, and all the old women were gossiping about him in the streets. With the outbreak of the peasants' war Luther became conservative—wrote mostly theological books, a good many in Latin, and completed and improved his translation of the Bible. Hans Lufft, his publisher, printed during Luther's lifetime no less than 100,000 copies of the Bible, while the number of reprints must a good deal have exceeded this figure. Luther never accepted any royalty, and with touching modesty begged the "pirates," out of respect for his literary fame, not to affix to their reprints his own publisher's name, and to desist from stealing the proof-sheets from his printer's office, which seems to have been their standing practice. He denounces a translator for taking a florin (about $4) honorarium for a folio sheet. Kapp remarks that these things are very different now. Notwithstanding the large editions in which Luther's pamphlets and books were printed, "editiones principes" of most of them are now very scarce. The house of Beck at Nördlingen has, however, succeeded in collecting a great number of such and other contemporaneous books and pamphlets by Luther's friends and foes, which, carefully catalogued, embracing 1,236 lots (of which 619 are Luther's own writings), are now offered for sale *en bloc*, through Messrs. B. Westermann & Co., of New York. One of our public-spirited millionaires should avail himself of this opportunity to secure for some public library this collection, which probably could not be duplicated at any future time.

—Among the various publications which, with the beginning of the coming year, are going to increase the already large number of German scientific and literary monthlies and weeklies, is one of a most curious character. It is, of course, also intended, as prefaces generally claim, to meet a long-felt want. The announcement in the *Allgemeine Zeitung* for Oct. 19 reads as follows:

"To all persons of poetic talent! Gentlemen and ladies who do literary work, but have hitherto been unable to make use of the first fruits of their inspiration, are offered an opportunity to share in a literary enterprise, by subscribing to the weekly which will be published by the undersigned, namely: *The Poet's Cradle*. It will be the common property of all persons of poetic talent. In subscribing you acquire the right to ask for publication of your own essays, in prose or poetry. *The Poet's Cradle* will regularly contain eight folio pages, and a supplement of eight octavo pages. Price for one year, only eight marks. C. Haas, Publisher, Hilpoltstein (Mittelfranken), Bavaria."

The ingenious Mr. Haas has been anticipated in this country. That curious but prosperous Boston weekly, the *Waverley Magazine*, was, we believe, founded upon the notion that the surest tie between publisher and subscriber would be to gratify the latter's desire to see himself in print.

—Dr. Damrosch is always on the lookout for interesting musical novelties, and he generally shows good taste in selecting them. The first two novelties of this season, however—the cantata "St. Ursula," by the English composer, Cowen, and a Symphony in C by the Russian, Tchaikovsky—have proved more interesting as evidence that other countries besides France, Italy, and Germany are bestirring themselves in music, than because of their intrinsic merits. Tchaikovsky's Symphony, which was produced at the Symphony Society's concert last Saturday evening, is a work in which, with the best of intentions, it is difficult to discover any signs of originality. The themes are elaborated with ingenuity, but are not striking either in a melodic, rhythmic, or harmonic sense. The national element or "local color" is not by any means so striking as in the works of Rubinstein, the greatest of the Russians since the death of Turgeneff. Where it makes itself felt is in the sombre orchestral coloring more than in anything else. Although Tchaikovsky is only forty-three years of age, he has contributed something to almost every department of music—4 operas, 4 symphonies, 2 concertos, chamber music, and songs; but if all these works were as weak as the symphony in C, he would never have gained his present position in the esteem of musicians. The last two movements are much better than those preceding them, which have all the appearance of having been added, as padding, in order to make up the orthodox number. And here we have perhaps the principal reason why the work failed to command the author's inspiration. The symphony as an æsthetic form is not adapted to the expression of modern ideas. Its equivalent in pianoforte music—the sonata—has already almost entirely passed out of use since Chopin and Schumann created their poetic shorter forms, and the orchestral sonata is destined to disappear also, being driven out of the field by the symphonic poem. The great formal shortcoming of the symphony is that its movements have no organic connection. They follow one another on the principle of contrast, but that is a very insufficient nexus. What would be said if a dramatist came forward with four one-act plays in which neither the persons nor the plot and motives were related, and called them a dramatic symphony or what not, simply because two of them were lively and the other two tragic? That is precisely the case with most symphonies. However, they enable a composer who has written a good movement to hitch on a few others that would otherwise stand no chance of getting performed, and this may be the main reason why some contemporary musicians still adhere to this unæsthetic form. Of course the best of the classical symphonies will survive in spite of their want of organic coherence and correlation of ideas in their movements; but modern composers should avoid these errors. Liszt has shown them in his symphonic poems how a few motives may be taken and developed in a poetic, connected manner, very much as a novelist develops his plot. Tchaikovsky has written two symphonic poems, and it is therefore to be regretted that he should have had a "relapse" into the symphonic form. The performance of the symphony by Dr. Damrosch's orchestra calls for high praise.

ILLUSTRATED HOLIDAY BOOKS.

Purgatory and Paradise. Translated by the Rev. Francis Cary, M.A., and illustrated with the designs of Gustave Doré. New edition. Cassell & Co.

The Raven. By Edgar Allan Poe. Illustrated by Gustave Doré. With comments by Edmund C. Stedman. Harper & Bros.

The Raven. New York: E. P. Dutton & Co.; London: Griffith & Farran.

Gray's Elegy. The Artists' Edition Philadelphia: J. B. Lippincott & Co.

Gray's Elegy. Illustrated by Harry Fenn. Boston: Roberts Brothers.

The Forging of the Anchor: A Poem. By Sir Samuel Ferguson, LL.D. Cassell & Co.

The High Tide on the Coast of Lincolnshire, 1571. By Jean Ingelow. Boston: Roberts Brothers.

Compositions from Shakespeare's Tempest and from Shelley's Prometheus Unbound. By Sir J. Noel Paton. Cassell & Co.

Lead, Kindly Light. By John Henry Newman. Boston: Roberts Brothers.

Michael Angelo. A Dramatic Poem. By Henry Wadsworth Longfellow. Boston: Houghton, Mifflin & Co.

The Renaissance of Art in Italy. An Illustrated History. By Leader Scott. Scribner & Welford.

Some Modern Artists and their Work. Edited by Wilfred Meynell. Cassell & Co.

THE business of illustrating books has become a branch of art so large and in many ways so important as to demand and merit a larger and more systematic study than it has received, and some determination of the principles which ought to guide it, as the chief method of popularizing art—if, indeed, it is permitted to speak of popularizing that which is, and must always be, reserved for genuine appreciation to prolonged and exacting culture, and therefore to few persons. Art, in its highest development, can no more be popularized than can the integral calculus; and any form of it that meets

with full and satisfactory popular appreciation must necessarily be art of a low grade—not of necessity bad art, but simple and elementary, just as a glee, or a hymn tune, or mere negro-minstrel's song, may be good and genuine music as far as it goes (and must be so to secure permanent popularity), and yet if compared with a Beethoven sonata or an overture by Wagner, is distinctly low and elementary music. In music, indeed, this distinction is so generally recognized that no demonstration of it is needed; but in the graphic art the mass of people know so little that it is hopeless to attempt to convince the public that the arts of design require just as severe and specialized an education as music to unable any one to pronounce an authoritative opinion. The *ne sutor ultra crepidam* holds always good, yet implies, however, that the shoemaker is good as far as his last, and that there are certain elements in art which are subject more or less to popular appreciation and judgment. The *infra crepidam* lies absolutely in the province of illustrated art. As to ideal art, the other great branch of the graphic, the younger and sublimer sister, popular appreciation is in the inverse proportion of its attainment. We may rank it inversely by the favor of the uneducated just as surely as by the direct appreciation of the accomplished critic.

Yet the greatest intellects ever employed on art have been engaged in what may properly be called book illustration. Raphael's Loggie contain the noblest series of Bible illustrations we possess, and Giotto's Arena Chapel is an historical picture-book which may be said to be, as far as modern art motive is concerned, the prototype of illustrative work. We regret the loss of Michael Angelo's illustration of Dante even more than the dilapidation of his "Last Judgment," and must hail in Botticelli the master of all story-book illustration. The descent from Michael Angelo's art to that of Gustave Doré is so tremendous that the fall below is not to be much dreaded. The success of the Frenchman's illustrations is a curious exemplification of the inverted relation between popular favor and artistic excellence. Even his illustrations of Balzac's 'Contes Drôlatiques,' in which he is at his very best—working with youthful vigor and originality, on subjects entirely akin to his genius—are comparatively unknown, while his Bible and Dante designs, morbid in imagination, fevered and flimsy in art, and shallow and commonplace in illustration of the theme, made his fortune and his popularity. There is probably no connected series of designs in existence combining so much pretension with such detestable fulfilment as these. He marches into the world of ghosts, tripping at Dante's heels with his Paris hat under his arm, his *pince nez* on his nose, with the assurance of a New York interviewer among newly arrived opera singers; carries a big sketch book in which at intervals he dashes off, with irreverent and indecent haste, his Cockney (he must have lived in London a long time before he drew his Dante designs) impressions of what took place; rushes through and puts his views before the world with an evident air of having considered the subject scarcely more gravely than he would have done a huge circus performance which he might have had to draw for an illustrated newspaper. His landscape is wretched and flimsy; he cannot give the time to draw a cloud or a bit of water: see his rendering of the sublime description of the ship coming with souls to purgatory (pp. 7, 8). When he puts us off with a landscape motive it is the landscape of a third-rate stage scene (p. 22). When the elements become tragic, as in the plate of Buonconte thrown up by the Arno (p 24), it is the clap-trap of the moving diorama. When he essays the lighter motives, as, Pia Tolomei before Dante and Virgil (p. 25), it is with a stage background flimsy and pale, with the three figures like monumental statues on a lawn. His majesty is that of a melodrama, and his dignity a caricature of the heavy gentleman of comedy. In only one plate in the entire 'Purgatory and Paradise,' that of Dante and Provenzano (p. 58), does he succeed, by loans from Michael Angelo and an unusual care for the art of his drawing, in rising above the commonplace.

What was left of descent, in the Dante illustrations, Doré accomplished in those of Poe's 'Raven.' There is a curious fidelity in the engraver's work; and probably in rendering the quality of the drawings, it would be very difficult to find a nearer approach to facsimile than these blocks. Take, for instance, the plate inscribed "Sorrow for the lost Lenore." The false perspective lines, the uneffaced lines of the first sketch, the tentative forms of the draperies, and *repentirs* throughout, all conscientiously preserved in the wood-cutting, are curious proofs of the unflinching exactitude of the engraver, even in the execution of one of the most frivolous and unconsidered designs which Doré ever perpetrated. The lines of the architecture, scrawled on the paper almost without aim, are not even indicated with recognition of perspective truth; the masonry on one side of the vault descends a course lower than on the other, though the structure indicates symmetry. The illustration, "'Tis some visitor entreating," is, if possible, more vacuous as conception and scarcely more sincere as design. Open the book where you will, there is evidence of a worn-out fancy, jaded artistic feeling, and an incompletion in working out, which can only be the result of utter indifference to the quality of the work. "Here I opened wide the door" is one of the most ludicrous of the series, the hero being struck with stark imbecility; while in the following design, "Open here I flung the shutter," he seems to be shouting a frantic alarm of fire out of his window, and in the next of the series to be in a fit of epilepsy. Illustration of poetry, to be truly illustrative, must put the theme in a new form—throw further light on it literally. Doré has neither followed the poem in these illustrations nor developed the theme in a new vein. The wreaths of kicking and writhing nymphs which float around the personage of the poem have no relation to it, or to any allied vein of thought; they are like an ethereal ballet troupe, save that they are so poorly endowed with individual grace. The theatrical tableau, "On this home by horror haunted," may be taken as on the whole the most apt illustration as such, but there is no room for great distinction. The grave and unconventional design by Vedder for the title-page is perhaps an unintentional foil to the empty and supercilious character of the designs of Doré. The sumptuousness of the get-up of the book leaves nothing to be desired, and the quality of the engraving in the orthodox manner is singularly fine.

The excessively commonplace illustrations of the octavo edition of the 'Raven,' the third on our list, are almost a relief from this nightmare-dream of Doré, but do not justify any connection with Poe, who is not to be illustrated without some sort of fancy, and these designs have none.

Gray's 'Elegy' is one of those minor immortalities which have the truest and strongest attraction for an illustrator. It is full of suggestions of poetic landscape and of tender and plaintive figure-themes. It, also, has called out two editions, both good in their way, but Mr. Fenn's designs are throughout so literal in their adherence to the text as to be devoid of imaginative interest. It is simply repeating, without thought, the ideas of the poet in another language. To furnish, as illustration of the lines —

> "Save that, from yonder ivy-mantled tower,
> The moping owl does to the moon complain"—

a carefully drawn owl (which might be from the taxidermist's) on a corner of ruined wall, and a full moon rising beyond, requires no intellectual resource. Nor is there in this edition a single design which leaves the commonplace level, though all as drawings are good, and some—notably the tail-piece; the church-yard scene at the end; "There, at the foot of yonder nodding beech," and "Far from the madding crowd's ignoble strife"—are excellent, but not in relation to the poem. The rival edition gives on the whole a higher average of art, and some felicitous cases of illustration. The contrast in the treatment of the themes, "Some village Hampden" and "Far from the madding crowd," is instructive, and the design for the former, in the Artists' Edition, is a gem in its way. Where Mr. Fenn has given us two boys preparing to fight, Mr. Frost represents a little drama of peasant life: an old woman, who has been gathering dead wood, assaulted by a landlord or his agent, and a peasant, of a sturdy muscular maturity, throwing himself between. In the latter we have from Mr. Fenn a picturesque cottage and a solitary traveller wending his way towards it; the other edition gives a rustic interior, with the tranquil peasant life with pipe and mug, and the old Bible by the fireside—not imaginative, perhaps, but it helps out the fancy of the poet. The illustration of "The boast of heraldry, etc." (p. 19 of the Artists' Edition) is admirable—the glory gone like autumn leaves, and sorrow alone remaining to tell what has been. As wood-cutting, it is not possible to improve much on the general character of the Artists' Edition, and the plate on page 37, though commonplace as illustration, as landscape is singularly fine. The frontispiece, and "Beneath those rugged elms," are very noticeable in their different ways. But why Mr. Smedley should, when the text says "the applause of listening senates . . . their lot *forbade*," give us an orator addressing some senate, we can only comprehend on the *lucus a non lucendo* principle—a bad one in illustration.

Dr. Ferguson's 'Forging of the Anchor' will not command much study, nor in fact furnish a single example of the true illustration of the text by the artist. The designers of the blacksmith scenes have never taken the pains to see an anchor forged, or we should say a sledge-hammer swung; and the marines are as much at sea, especially in the absurd thing at p. xii. To illustrate "The ruddy, lurid row of smiths that stand, an ardent band, like men before the foe," we have, on the *lucus a non* principle, a battalion of Dutch musketeers about A. D. 1600, having first fired their guns at an invisible foe. To a poverty-stricken illustrator any association serves as a peg to hang his picture on.

With a certain redundancy in the designs, the edition of the 'High Tide' of Jean Ingelow is admirable. Mr. Church fairly wins the honors of the tournament, and his designs "My sonnes faire wife Elizabeth," "And all the air, it seemeth me," and "The waters laid thee at his door," show him to be a true illustrator, in whose talent a vein of sympathy exists on which the poet will not call in vain.

Sir J. Noel Paton's outline compositions from Shakspere and Shelley hardly come within the limits of art, so artificial and so devoid of

genuine inspiration are they. Shakespeare is not a subject for third-rate men, but in the compass of his plays may be found subjects for almost any illustrator gifted with insight, or outsight, of human nature. We do not know that any painter has done dramatic justice to the woes of *King Lear*, or that any one has touched the virginal ideal of *Miranda*; but between those there are thousands of types we may meet any day in almost any land. But of all the impossible plays to anybody but an illustrator of the highest imagination, "The Tempest" and "Midsummer Night's Dream" are the furthest out of reach. Sir Noel Paton not only has no imagination, but his fancy never gets beyond the lines of the 'Arabian Nights.' A man who will wrestle with Caliban must be a Michael Angelo or a rash and uncomprehending adventurer. Sir Noel Paton's designs (which, by the way, are a generation old) do not seem to aim at anything beyond the reach of stage spectacle, with a standard of dramatic expression drawn from the rant and posturing of the English theatre; and his type of horror scarcely goes beyond the grimaces of a naughty child. His Shelley designs, again, are attempts of the incapable to deal with the impossible. Shelley is the least to be drawn of all poets, and it would be difficult, perhaps, to find a series of ambitious designs with so much majestic inanity and vapid grace as those before us.

The little volume which makes its burthen of the 'Lead, Kindly Light' of Newman, is a combination of monochrome illumination with commonplace illustration—the former graceful and marked with fine fantasies and real illustrative suggestion; the latter, though pictorially well felt, would answer almost as well for any other poem. "Those angel faces" is represented by a very ordinary half-length, with no manner of divinity in the face; and the "Pride ruled my will," by a showily dressed lady who might be a figure taken out of a picnic party. It is a mistake to push illustration into such a field; the poem is purely devotional, and cannot be illustrated. Illuminated it may be, and has been here, well enough to content the public, we should think, without the woodcuts, which are heavier freight than so frail a bark will carry.

The (on the whole) magnificent edition of Longfellow's 'Michael Angelo' is, so far as typography, the printing of the woodcuts, and general get-up are concerned, a book to be proud of. The illustrations vary widely in merit as designs, and it is impossible not to see that some of the illustrators have missed an opportunity which will not soon return. The opening illustrations are unfortunate, the frontispiece (admirably cut by Mr. Kruell from a French engraving) in its printing, and the half-title and dedication in design and cutting; but the head-piece of part first is excellent, as are Hovenden's "Michael Angelo in his Studio," and Thurlstrup's "Cardinal Ippolito and Fra Sebastiano," and the half-title to part third. Millet's "Michael Angelo and the Monk" and the Michael Angelo and the Dead Christ are distinctly noteworthy designs, and the engraving generally excellent. The portraits, from engravings (with exception of those of Julia Gonzaga and Vittoria Colonna), and the little heads in the notes (a valuable innovation), are as well and carefully rendered, either as copy or engraving, as we could ask; but the more ambitious designs, Millet's "Vittoria Colonna, Michael Angelo, and others," singularly careless in drawing. "Julia Gonzaga and Valdesso," and the spectacular Cellini in the foundry, do not seem to have been conceived with any distinct relation to the poem or to the function of illustration. Shirlaw's large design of the studio scene is fine as a whole, but poor and weak in the working out of the parts. The views are the worst element, and the large "Venice by Night" is a distinct absurdity and misnomer as drawing—singularly well done as engraving.

The more commonplace and common-sense view of illustration is well represented by the 'Illustrated History of the Renaissance in Italy,' of Leader Scott, in which the salient points of the development of the art in Italy, during the period which is most unscientifically called the Renaissance, are given in woodcut illustrations, without any of the charm of the new school of artistic wood-cutting, to be sure, yet in the main excellent examples of the old orthodox manner of cutting, and serving most satisfactorily to convey the general idea of the works as examples to those who have not seen them, and to recall pleasantly the treasures of Italian art to those who have. Even after Symonds's and Perkins's, Mr. Scott's work, though not to be held up as an authority in critical matters, is an acquisition for the general excellence of its illustrations and their range of matter. Being generally taken from photographs, apparently, and from the works of the masters, they are not, as design, subject to criticism; and though in cases where delicacy of expression or shade of fidelity of facial expression is concerned the wood-cutting fails, as in the St. George of Donatello, the quality of the work is all we need ask for the purpose.

The more ambitious work on 'Modern Artists' (a reprint from Cassell's *Magazine of Art*) does not justify its pretensions. The literary portion of the work—joint contribution of that young school of English literati who merit a new definition of the term "agnostic"—is scarcely within the province of the present criticism, except as it is the pretext of the book, whose chief motive is the illustrations. If the literary element is flimsy, the pictorial is trashy; the selections of the subjects being governed by no rule of artistic nobility, but apparently by personal preferences. Of the many indifferent illustrations, those of the work of Mr. G. F. Watts are the very worst, and none are above the level of the woodcuts of the London *Graphic*. The making of such works is unfortunately likely to have no end, as the ability employed in them will probably never be rare.

CHILDREN'S BOOKS.—IV.

THE mixture of colors on the outside of Hezekiah Butterworth's 'Zigzag Journeys in Northern Lands' (Boston: Estes & Lauriat) fitly typifies the confusion of topics within. The title is misleading, for, as the author says, "The Zigzag Books . . . do not aim so much to present narratives of travel as the histories, traditions, romances, and stories of places"; and besides, although the volume claims a range "from the Rhine to the Arctic," very little indeed is said of any northern land except Germany. The contents are a jumble of fragments of description, history, and biography, with fairy tales, legends, poetry, ghost stories, etc. Macbeth, St. Dunstan, Moltke, Beethoven, the Lorelei, Voltaire contribute to the heterogeneity. No doubt there are many interesting pages and various well-selected woodcuts—notably those of old buildings; and with those people who like a little of everything at the same time, the book ought to find favor.

It is a pity when the Arctic regions afford so many opportunities for adventure, and such a variety of striking and interesting phenomena, that a story-teller should feel driven to introduce Spanish pirates in the North Atlantic, and antelope, bison, and wild turkeys in Labrador. These are, however, considered necessary by the author of the 'Cruise of the Snowbird' (A. C. Armstrong & Son) to sustain the interest of his narrative, although he professes to have himself been in the Arctic seas. The book is unobjectionable in matter, except for such anachronisms, and fairly well written, except in the matter of dialect. Such as has been introduced was surely never spoken by mortal man. It is something to have a boy's book free from vulgarity and precocious love-making; but little more in the way of merit can be claimed for this.

'The Boy's and Girl's Plutarch' (Putnams), edited by Mr. John S. White, is in all respects better conceived and executed than the 'Young Folks' Plutarch' we lately criticised. In the first place, it preserves Plutarch's own language, as far as practicable, using Clough's improvement upon Dryden's version. In the next place, it omits some of the lives, and from others it takes only the most striking or famous passages, as the description of Archimedes's engines, from the Life of Marcellus. These selections have been made with good judgment. Then there is an abundance of illustrations, of different grades, to be sure, but all useful and interesting. There are maps, as in Miss Kaufman's edition, and, as there was *not* in hers, a chronological table, full and clear; finally, a pronouncing index of names. Mr. White's preface we find rather extravagant, and pitched too high for his readers; and it must be said that he has too scrupulously abstained from tampering with the translation in some instances. Here is a specimen sentence that would have borne simplification (p. 370): "Eudoxus and Archytas had been the originators of the far-famed and highly-prized art of mechanics, which they employed as an elegant illustration of geometrical truths, and as a means of sustaining, experimentally, to the satisfaction of the senses, conclusions too intricate for proof by words and diagrams." The volume is exceptionally substantial in make, and large and clear of print.

The Rev. Alfred J. Church offers in his 'Stories from Herodotus' and 'Stories from Livy' (Dodd, Mead & Co.), as in so many other of his classical abstracts for the young, a first-rate example of elaboration as opposed to quotation and compilation. His workmanship is too well known to require description or praise. The illustrations, as if from painted vases, are a pretty fashion.

Unquestionably, the hero book of the season, by long odds, is Mr. Howard Pyle's 'Merry Adventures of Robin Hood' (Charles Scribner's Sons). We place it, in point of beauty and elegance, at the head of American juvenile productions. The taste of the artist, printer, and binder is faultless, and in every regard the volume is a delight to the eye. Mr. Pyle's prose rendering of the ballad need not be scrutinized too closely as an antiquarian performance: the child will appreciate its flavor without being able to detect the anachronisms. The narrative is thoroughly pleasant, often picturesque, and it will infallibly interest. The designs, by Mr. Pyle's own hand, furnish new proof of his imaginative capacity and his firm and skilful draughtsmanship. They do more than that, for there are initial letters, borders, and head and tail-pieces which bear witness to a high order of decorative talent. Very few of these fail to give entire satisfaction, and we welcome them as a sign that our publishers only need a little courage to enable them, by the aid of native artists, to rival the charming workmanship of the best French and German houses. We do not refer simply to *éditions de luxe*.

Two new volumes of the excellent series of "Minor Wars of the United States" (Dodd,

Mead & Co.) are before us: 'King Philip's War,' by Richard Markham, and a 'History of the War with Mexico,' by Horatio O. Ladd—it would seem, professors in the University of New Mexico. King Philip's war was the last of a series of Indian wars in New England, and this volume contains an account of all these, beginning, indeed—which was hardly necessary—with the Northmen and the *Mayflower*. The history is told in a very interesting way, and may be recommended as an excellent book for children. The 'Mexican War' is adapted to a rather older grade of readers, and ought to be welcomed by a great many persons who have wished to have a compendious account of that important event. It is a great satisfaction to find the cause of the war boldly given (p. 29) as "the purpose to extend human slavery into free territory." We are surprised, however, in the account of the early history of Texas, to find no mention of what we have always supposed to be an established fact—the deliberate colonization of that territory by American citizens, with the purpose of detaching it from the Mexican republic. The illustrations are for the most part of the usual kind—fancy pictures—but good of their kind. Each volume, however, contains a good map.

Mrs. Moulton's 'Firelight Stories,' comprising "Sol Jones's Orphans," "The Little Silver Lockets," and a number of others (Boston: Roberts Brothers), will be found interesting, but they are not thoroughly artistic: the characters lack shading, the incidents are apt to seem unnatural, and a certain crudity betrays the absence of a master-hand. However, the intent of the book is to advocate love and kindness, and the stories are touching. It is not suitable for young children.

'A Round Dozen' (Boston: Roberts Bros.) is a collection of thirteen stories by "Susan Coolidge." To say they are hers is to declare them fresh, bright, kindly, refined, and abounding in common sense as well as pleasant fancy. There is ample variety of subject in the volume before us, and both boys and girls will be pleased. Readers of *St. Nicholas* will recognize some old favorites.

The story of 'Donald and Dorothy' first appeared in *St. Nicholas*. The handsome volume which Roberts Bros. now offer to the juvenile public will be welcomed by those who have, as well as by those who have not, already made the acquaintance of "the two D's." Never were there a more charming brother and sister, and it is needless to say to any one familiar with the pen of Mrs. Mary Mapes Dodge, that she has made the narrative of their home-life and country pleasures brimful of vivacity and cheerfulness. The introduction, however, of a mystery, the shadow of which sorely puzzles Donald and Dorothy, and often darkens their sunshine, is alien to the general spirit of the book; and the intrusive stranger who disturbs the peace of the household, seems transplanted from a commonplace novel. However, uncommon and improbable things do happen, and if we do not object to the unusual combination of incidents which has given rise to the mystery, perhaps we must forgive the sensational stranger. But the improbable becomes the absurd when a boy of scarcely sixteen starts off to Europe alone to discover traces of a woman not heard of (despite advertisements and detective vigilance) for fifteen years; and *succeeds*, after disclosing enough insight and perseverance to do credit to a man of thirty. This is a serious blemish in a delightful book, and ought to be carefully pointed out to children in the interest of common sense and sound judgment.

'Jingles and Joys for Little Girls and Boys,' by Mary D. Brine (Cassell), deserves to be encased in something better than its rather tawdry cover. If the object of such a book is that children from three to six years old should take it to their hearts and carry it about all day and sleep with it beneath their pillows at night, that aim is well attained. Its vast multitude of pictures, its profuse abundance of pussy-cats, and bow-wows, and little babies, will endear it to the childish soul. The pictures, in fact, have lifelike and inexhaustible qualities, and the very simplicity of their ingredients will be sure to please. The verses are commonplace, and the author has not that unequalled gift of joyous nonsense which marks the editor of *St. Nicholas;* but she has a jubilant strain which never falters, and rarely descends to slang. No harm is to be found in the book—unless the too abundant use of the word "sissie" be accounted as harm—and it holds floods of innocent enjoyment for those whom it addresses.

An unadorned tale of Indian life on the Red River of the North in the early part of this century is the autobiographical history of John Tanner's captivity. This, edited by Edwin James, the historian of Long's expedition to the Rocky Mountains, was a classic, in its way, when first printed more than fifty years ago. It has now been condensed and reprinted under English editorship as 'Grey Hawk' (Lippincott). It is the true story of a little boy, stolen in Kentucky by Shawnees, who grew up adopted and naturalized among the Ottawas, to whom he was transferred by purchase. Its interest lies in its direct speech and in its homely details of the barbarism and poverty of nomadic hunters, often distressed for want of food, and often in misery from rum. The savage virtue of hospitality and the civilized vice of drunkenness have many examples in its pages, and one learns that life among the less fierce tribes of the Northwest was an irregular succession of hunting, starvation, very transient abundance and carousing, cold, and poverty. There is a dearth of the legends that we might expect (the story of Moowis, the snow-spirit used in "Hiawatha," being the chief); and the book, although really interesting, is in no respect exciting, and will neither keep boys awake at night nor tempt them to want "to go and live among the Indians"—a childish wish to which John Tanner attributed much of his subsequent misfortune. There are several spirited illustrations, but the artist forgot that a charging buffalo never carries a drooping tail, and had he witnessed the canoe race he depicts he would have seen the contestants kneeling, not erect.

Sir Samuel Baker's capacity for interesting narrative had been so fully proved in his books of sport and travel, that we expected much of his 'True Tales for My Grandsons' (Macmillan & Co.). The collection is, however, a singular medley, in no way remarkable, and displays here and there a certain coarseness, hardness of feeling, even indelicacy (considering the writer's audience), which readers of his African adventures can hardly fail to recognize as characteristic. The first story, of two dogs, is quite unfit for childish reading by reason of these defects. The second, "The Cruise of the Whaler *Sophia*," leads up to an Enoch Arden situation without dignity or heroism. The third is a cumbersome tale of the Sikh war of 1845-6, of which the point is the curious fact that the survivor returns hoping to marry his old love, now a widow, and takes her daughter in preference. "Hassan Ali and the Golden Basin" is comparatively unobjectionable—not wholly. Dog and elephant tales conclude the volume, and are by far the most valuable; but even here a certain inhumanity—the sportsman's, shall we say?—and a strange indelicacy crop out. Mr. Hennessy's illustrations are above the average.

'Won from the Waves' (E. P. Dutton & Co.) is one of the late Mr. Kingston's stories, which follows the safe sailing directions for a quick and prosperous voyage between the literary ports with which he habitually trades. It tells of a little girl, the sole survivor of a wreck on the English coast. Her jewels and linen prove conclusively her gentle birth. She is adopted by an ancient mariner, her rescuer. The rest may be easily surmised. We have in succession aristocrats, villains, a comedian or two, and the gallant young naval hero, who performs prodigies of valor, and ultimately marries the heroine. The padding is made up of naval battles and some detective work in harmony with the period—the earlier portion of the present century. 'From Powder Monkey to Admiral' (A.C. Armstrong & Son), by the same author, is, with a slight variation of incident, a repetition of his other books. The title sufficiently explains what may be learned from its perusal.

Mr. Manville Fenn's 'Middy and Ensign' (E. P. Dutton & Co.) possesses both interest and value. It relates the military and naval adventures of a joint expedition of the two arms of the service, to give English protection to a petty Mahometan potentate on the Parang River on the west coast of the Malay peninsula. The story is told with spirit and vivacity, and is instructive to the youthful reader, inasmuch as the scene is laid in a locality with which but few persons are familiar.

The illustrated juvenile books for the present season exhibit little originality. We except Kate Greenaway's designs for sundry poems by Jane and Ann Taylor, 'Little Ann and Other Poems' (Routledge), the text of which, by the way, is sometimes badly punctuated, and differs astonishingly from that which happens to be nearest us for comparison. Her materials are old and familiar, but her combination of them is ever fresh and delicate. To such vignettes as those representing the four Locker children, to whom the volume is dedicated, the pathetic orphan girl, the dreamy child listening to her inward monitor, the sportive group upon the village green, one turns again and again; and others might be named as good as these. Add the dainty tail-pieces, usually with a flower-motive. Then, for evidence of inexhaustible ingenuity, take Miss Greenaway's 'Almanack for 1884' (same publishers), with its novel symbolism for the zodiac—full of refined humor. Altogether we may say that this delightful artist shows no falling off in her work.

Not so Mr. R. Caldecott. His two picture-books—'The Fox Jumps over the Parson's Gate,' and 'A Frog he would a-Wooing Go' (Routledge)—are unworthy of the series which they continue. The colored drawings particularly are so poor and so little characteristic as to make the familiar initials seem counterfeit. In the outline sketches there is here and there a trace of Mr. Caldecott's genius, but they are mostly below his average.

Other productions in color need not detain us long. Mr. H. W. McVickar has caught the spirit neither of the poem nor of the time in his drawings for Dr. Holmes's stirring 'Grandmother's Story of Bunker's Hill Battle' (Dodd, Mead & Co.). His color sense, too, is as crude as his humor is coarse and his draughtsmanship feeble. The plates in 'Told in the Twilight' (Dutton & Co.) can be better spoken of, and indeed lack nothing on the score of refinement, however much they leave to be desired in respect to line and tint. Moreover, there is a certain cleverness in the decorative borders in which the verses are set, especially the pictorial borders. The poetry itself is but mediocre, and when jocose is at best a mere dilution of the metrical nonsense

in 'Alice in Wonderland.' 'Children's Thoughts in Song and Story' (Cassell) is a book to be shunned. The "song" is wretched doggerel, and the lithographic illustrations do not merit a civil word. Nor can we say anything of the black-and-white 'Alphabet Children' (White, Stokes & Allen) except that all concerned in making it must have an eye for ugliness. Mr. Walter Severn's fancy and skill, again, are unequal to the task of illustrating Lord Houghton's 'Good Night and Good Morning' (Roberts Bros.) with illuminated and etched borders.

NEWFOUNDLAND.

Newfoundland: Its History, its Present Condition, and its Prospects in the Future. By Joseph Hatton, author of 'To-day in America,' etc., and the Rev. M. Harvey, a resident of St. John's, and author of 'Across Newfoundland.' Boston: Doyle & Whittle. 1883.

THE story of Newfoundland (let Americans, who almost always call this name wrongly, know that the stress is on the last syllable) is, for strangeness, almost beyond belief. Few readers or travellers or men of enterprise, up to this now-running year of grace, one thousand eight hundred and eighty-three, know how strange it is; or, rather, few have a thought that it is in any way strange, or out of the common, or worth the looking into. Indeed, if even a little of the truth about that country had leaked out to the knowledge of the world at large, at any time in these almost four hundred years last past, in which all Europeans who knew much have known that that great island was standing forth, one thousand miles, in front of this continent, broad in the track of all ships coming—nay, sought and visited by hundreds of ships, in every one of those almost four hundred years—if even a little of the truth had been guessed, in all those years, by a few scores of men with lively blood in their heart, the strangeness of the story would have been out and done with before to-day. As things are now, Newfoundland waits, before the eyes of the world, known, and yet—till just now—almost as utterly unknown and worthy of being revealed and understood for what it is, as was the woman set in front of Admetus, and of whom he speculated (before Herakles took away her veil) that she had the proportions of a queen; or as was *Hermione* standing for a statue on a pedestal, when *Leontes* was saying:

> "See, my lord;
> Would you not deem it breathed? and that those veins
> Did verily bear blood?"

The story of that island may very fitly be compared to that of such a being—first clothed in mystery, and afterwards, when the time came, suddenly brought out of it, as brought from death to life.

Nor let any one wonder at our treating of that country, in so far, as a person. This way of treating it comes (for our purpose) naturally: it offers itself. The strange story is not about dynasties, or races, or institutions, or social happenings. Of course, where such men as John and Sebastian Cabot, and Sir Humphrey Gilbert, had much to do, there must been (and was) plenty of bold, wise seamanship and knightly doing and bearing; and among those tough and doughty sailor-races that, as soon as the great new fishing-grounds were heard of, all crowded to the coasts of Newfoundland and the Grand Banks, there must have been plenty of yeomanly and sailor-like good deeds worth telling. And surely, where a race of friendly, manly red men has gone out utterly from life, and so suddenly that its wattled deer fences were still stretching across their empty country, and clusters of wigwams and huts, and of houses for the dead, and canoes, and tools were found, on search, but not a living man, there must have been heart-touching things enough. But the strange story is of Newfoundland itself, a whole country, and a good country, really *unoccupied*, to this day, nearly four hundred years since it was "found."

In August, 1497, King Henry VII., of England, in his niggardly way, gave "To Hym that found the newe Ile, 10*l.*"; and till now this great country, larger than Ireland by a good deal, with its fine rivers (no match, to be sure, for Mississippis and Amazons, but fit to run beside a Merrimac from end to end), rich valleys and plains, noble forests, great mines of coal, copper, and lead (gold, too, it seems), huge beds of slate, gypsum, marble, and granite, and everything that need go to the making of a country which, of itself, could keep freely some millions of people without ever touching the fisheries, has been held tight down to loneliness and waste, except where a little sprinkling of settlers cling to the very outermost rocky edge of one-half of its coast. Inside, those deep, fat meadows, countless timber trees, running up fifty feet without branch or knot, and measuring four or five feet through at a man's height, water powers, mines, quarries, and the rest, have been left to such husbandmen, lumbermen, millers, and miners, as bears, and beavers, and black ducks, and hares, and moose, and reindeer—these last, to be sure, "as tall as a horse." Even the "Beothic" or "Bethuk" race of Indians (a fine sort of savages), who were hunted down and killed off, have never been replaced by other men. One hundred and eighty thousand people have got a footing on the rocks of the worst half of its shore—as stout, friendly, sober, law-abiding, God-fearing a set of men as can be found on earth—and they have been enough to handle the fishing, and "swiling" (seal-hunting), and fish-drying, and oil-making. They bring in yearly and cure enough to fetch five or six millions of dollars for the dried cod, half a million for cod oil, two-thirds of a million for seal oil, and another third for pelts. No number of men can get beyond about that tale, in cod and seal-fishing, for, vast as it is, and never-failing, the supply never goes beyond about one mark. But these good sturdy folk have, all these ages, been working with their backs to the meadows, and pasture grounds, and rivers, and woods, and the underground wealth, as if their lives depended on their never looking over their shoulder that way.

By this time it may be thought that the book whose name stands at the head of this article is a romancing book, or written in the interest of speculators, and clever enough to get hold of its readers by the fancy and make them see a barren and dreary old island through a glamour of the writers' raising, instead of its own cold fog: but this is not so. The book is, indeed, good and interesting and thorough and well written, but it is without the smallest bit of imagination or fancy to mislead the reader. It is no Sir John Mandeville's tale of things seen golden-purplish, and out of shape, through an ill-fitted spy-glass. It has in it only the earnestness of conviction and of faith in the holding of strong facts. The book does not make the strangeness of the story; it has nothing to do with the making of it. The book only puts the case to the world of readers in a plain, unvarnished way, in good English, and with good sense, and proves it and makes it clear by ample testimony and figures. Thus, mining has just begun (still near the coast), and in six years has made Newfoundland the sixth copper-trading country in the world. And this is the merest beginning.

The way of the whole thing was this: Ships came out and fished the summer through or till they were full, and then went home with their fares. A never-failing market was open in every land in Europe for the salted fish, and merchants, from the first, saw their own good in the keeping of ships and men going and coming from their own hands to the great fisheries, and back to their own hands. Statesmen, too, from the first, thought how those sea-going fishermen would make ready crews of the boldest, toughest, wholesomest stuff, for war-ships. So, from the very beginning, almost, the traders found it easy to get Orders in Council, or Acts of Parliament, or whatever they wanted, to make sure that no settlements should be made in Newfoundland, and that shippers of fishing ships should, under penalties, bring back to England the same men that they carried out. Early, a grant or so to Sir Humphrey Gilbert and Calvert Lord Baltimore had come to nothing but loss and failure, and had only helped the side of those who wished to keep the island from all settlement, and the rocky shores, on the east and south, for the "flakes" and "stages" of the summer fishermen from England—leaving the western and northern shores for the same use by the French, who had got a claim recognized by treaty. The eastern and southern edges are rocky and barren always, and foggy often. No civilized man had ever (till sixty years ago—nearly three hundred and fifty years after the Finding) set foot in the inside country; and then it was only one single Scotsman, with a Nova Scotia Indian, for the tramp. The traders had given the land a bad name, and cried it down; and, literally, up to 1811, had, with law on their side, kept even the English shore, formally, for two hundred yards back, for "fishing-rooms," that is, for use of the ships from England. No grants were made, nor was property in land, "not actually employed in the fishery," recognized. A dozen years before, the sheriff had been ordered to see that a certain "fence" should be pulled down, and certain "sheds," also, and not to allow any chimney to be built, or fire to be made, in "sheds." There were people living, all the year round, about the coast, somehow or other, in spite of everything, but the traders had got there, too, among them, and all the right in the soil, or anything on it or in it, was mere sufferance, as to squatters on a "common." "If any person shall presume to fence or to enclose any lands . . . all persons are at liberty to take down such fences and enclosures," was the reading of the law. At length the struggle of these hundreds of years slowly and hardly died out. It is hard to change an opinion which has had everything to itself for ages, and it will take time to turn off a fair share of the stream of seekers for homes and wages, which runs along the very coast to other shores; but now railways are building, mines opening, and a traffic beginning to and from the inland. Before long, we may hope that "valleys shall stand thick with corn," and the meadows be grazed by fat herds ("fessæ pecudes pingui per pabula læta") throughout the land, and rumbling trains of cars and deep-laden ships bear the yield of a thousand mines and quarries.

History of the Third Pennsylvania Reserve. By Major E. M. Woodward. Trenton, N. J.: Printed by MacCrellish & Quigley.

SUCH books as this serve a valuable purpose in preserving the details of the actions and experiences of the smaller commands composing an army, which are necessarily lost in works of a larger scope. They are useful contributions to local and personal history, and a just pride fosters the production of them. Major Woodward has given us an interesting account of the origin and history of the Third Pennsylvania Reserve, a regiment which made a creditable record as part of one of the best divisions in the Army of the

Potomac. His account is distinct, and many striking incidents of camp and field are well told. This division saw much hard service, and bore an honorable part in many of the great battles of the war in Virginia, especially during the campaign of 1862. Among its early officers were some who, like Reynolds and Meade, rose subsequently to high command. In narrating the history of his regiment the author has given a sketch of the actions of the whole division of which it was a part, and indeed of the Army of the Potomac. We think he has erred in devoting too much space and attention to this instead of to a fuller chronicle of the life and actions of the regiment itself.

As a sketch of the operations of the Army of the Potomac the book has little or no value. The statements are for the most part one-sided, and often very inaccurate. The author's selection of authorities is somewhat singular, as when, in preference to the official reports, he looks for information about the numbers and operations of the Confederate army to newspaper articles written during or soon after the war, or to Pollard's History, which was made up from such articles. He is not careful enough about his data when they favor the Federal side. Thus, such information as General Porter could gather some ten or twelve years ago is taken, in place of the official reports, to determine the strength of Pope's and Lee's armies, and a statement in a Richmond newspaper of the time is taken as fixing the Confederate strength at Antietam. An old soldier is apt to see the achievements of all other commands save his own through the wrong end of the telescope, but it is not often we have so striking an instance of this as on page 112, where our author says of the battle of Glendale (June 30, 1862): "That the Reserves (McCall's division) fought it alone against thrice their number, and within sight and hearing of three or four times their number of national troops, who did not lose ten men, is an incontestable fact."

On this day the Union army stood with its right at White Oak Swamp, where Franklin was holding Jackson in check, its centre on both sides of Glendale, and its left, under Porter, at Malvern Hill. McCall's position was at the very centre, and somewhat advanced. On his right was, first Kearney and then Slocum; on his left, with an interval, was Hooker. Sumner, with Sedgwick's division, was in his left rear, covering this interval. Moving against the Federal position were Huger's division on the Charles City road, who threatened Slocum's front, but did not seriously engage him, and Longstreet's and A. P. Hill's divisions, which, advancing on the Newmarket road, first struck McCall. McCall was driven back on his supports. The right brigade of Hooker's division went to his assistance, and Sumner used vigorously his artillery and the only brigade at hand until he could hastily recall two brigades he had sent to Franklin's aid. They returned just in time, he says, to enable him, after a furious contest, to hold his position. Meantime, Kearney was resisting Longstreet's attacks on the right—attacks made, he says, with a determination and vigor he had never witnessed. He was obliged to call for reinforcements. Taylor's brigade was sent to him from Slocum, and Caldwell's brigade was brought up from White Oak Swamp. After the defeat of McCall, these troops combined succeeded in staying the progress of the Confederates, but when night had come the corps commanders present concluded it would not be proper to risk another day's fight on this ground, and so retreated without waiting for McClellan's orders.

Thus, instead of McCall's three brigades alone holding Longstreet and A. P. Hill in check until nightfall, there were, besides these, three other *divisions* (nine brigades) seriously engaged. Major Woodward, naturally enough, perhaps, defends McCall's division from the charge of bad conduct on this occasion, which is suggested in Hooker's and McClellan's reports, but here again his partisanship carries him too far. Hooker's statement that the "whole of McCall's division was completely routed" is, no doubt, too sweeping, and is unjust, but the official reports of every Federal officer of high rank on the field, except McCall—of Sumner, Heintzelman, Hooker, Sedgwick, Kearney—leave no reasonable doubt as to McCall's defeat. On the other hand, Lee distinctly claimed the victory, and he had fourteen pieces of artillery, taken from McCall, to show for it.

Life of Luther. By Julius Köstlin, with illustrations from authentic sources. Scribners. 1883.

Martin Luther, the Reformer. By Julius Köstlin. Translated by Elizabeth P. Weir. London and New York: Cassell & Co.

Life of Martin Luther. By Dr. William Rein. Translated by Rev. G. F. Behringer. Funk & Wagnalls.

Dr. Martin Luthers Werke. Kritische Gesammtausgabe. Weimar: Hermann Böhlau.

KÖSTLIN'S biography has proved a very mine of wealth to bookmakers and publishers. Scarcely anything in the form of Luther biography has appeared of late that was not directly based upon its researches. We had occasion to notice, some weeks since, an English translation from Köstlin's popular Life, and now appears another, claiming to be "authorized" by the writer himself. It is a great improvement upon the earlier translation, showing care and fidelity in the revision, and reproducing fairly well all the illustrations and facsimiles which gave a peculiar value to the original.

The second book on our list is a neat little volume of a hundred and fifty pages, giving with sufficient clearness the main facts in the Reformer's life. It is perhaps the best of the brief abstracts from Köstlin's great work.

Doctor Rein of Eisenach has written a very short epitome of Köstlin, designed to be what the Germans call "universally intelligible," and making no claim to especial value for the scholar. It appears in English in Funk & Wagnalls's "Standard Library."

Altogether the most important memorial of Luther is the new critical edition of his works undertaken, with the support of the Prussian Government, by Dr. J. K. F. Knaake. This truly monumental work is intended to replace all existing editions. It is justified by the great increase of information upon all the details of Luther's writings, and by the inherent defects of the earlier editions. These were generally, in accordance with Luther's own view of the matter, arranged by topics, so that it was often difficult to settle satisfactorily under what head a given writing belonged, while treatises bearing a close relation in time were scattered, perhaps, in several different volumes. The arrangement of the new edition is to be strictly chronological, Latin and German writings being thus mingled in each volume as they were in fact developed in the mind of Luther himself. Each treatise, sermon, or letter is to be preceded by a short introduction, with references to passages in which it is referred to, and a complete bibliography of its editions. The original orthography is to be preserved as far as possible consistently with clearness. The editor proposes to produce at the rate of about three volumes yearly, the whole edition to consist of thirty-five volumes. In the list of subscribers it is interesting to note that the United States appears for thirty-eight copies, Great Britain for seven, and France for three.

Watteau. By John W. Mollet, B.A. New York: Scribner & Welford. 1883.

THOUGH the name of Watteau seems to us hardly important enough to find a place in a series of biographies of great artists, it is nevertheless one worthy of considerable honor. Watteau was a man of true genius within his range, though his natural limitations and his training were such that he cannot be called a *great* artist. The love of fêtes, fairs, and gala days which was born in him as a Fleming, and was stimulated by the circumstances of his subsequent life in France, was the leading theme upon which his art played with many graceful variations. In subjects of this kind he dwelt rather upon the refined than the vulgar side. There is nothing of the coarseness which characterizes the pictures of Teniers in his designs. It is true that his ideals were largely theatrical, derived as they were from the harlequins of Valenciennes and the ballet-dancers of Paris. He was eminently a painter of the superficial aspects and sentiments of a grossly artificial state of society; but he had a true painter's eye, and in his enjoyment of beauty—especially beauty of color—he manifested a very close kinship with the greatest masters. So largely is this the case that one is tempted to believe that, had he been surrounded by conditions favorable to his best development, he might have become almost a great painter. Considering the comparatively frivolous nature of the society in which he moved, he was a man of singular earnestness and aspiration. He was never satisfied with his own work, but was always striving to make it better. With a view to improvement it was his pleasure, so this biographer tells us, to copy all the pieces by the greatest masters in the possession of his friend and patron, M. Crozat. But these efforts were less fruitful than they might have been had he known better how to direct his studies. Watteau never enjoyed wise guidance. His best impulses were received from the works of Rubens and Van Dyck, which, good as they were, could not lead to the same excellence that might have been reached through those derived from the study of greater masters. Watteau's life enforces the lesson that high excellence in art cannot be attained by unaided effort, however earnest or faithful: surrounding conditions of taste and aspiration, directed towards what is best, must coöperate. There is great paucity of accurate knowledge concerning the details of Watteau's life; but Mr. Mollet appears to have done what he could to gather and arrange in this volume the leading facts of it.

The Course of Empire: Outlines of the Chief Political Changes in the History of the World (arranged by centuries), with variorum illustrations. By Charles Gardner Wheeler. Boston: J. R. Osgood & Co. 1883. 8vo, pp. 459.

THIS book consists of a series of maps of Europe, one for each century, beginning with B. C. 500, and ending with A. D. 1883. A short, well-written, and accurate statement, in large type, accompanies each map, and introduces each division of the events of the century; and each part is illustrated by a large number of extracts, very well selected from a wide range of authors. There is also a list of dates and eminent names for each century. The maps are small, but very clear and instructive. Being all on precisely the same scale, the changes in territorial re-

lations, expressed in distinct and positive colors, are brought very clearly before the eye, so that the "course of empire" can be easily traced from century to century. The maps, of course, aim to give only outlines without detail—just indicating a few rivers and mountains and the capitals of the principal countries. It is, no doubt, the best plan to give the map at the even centuries, as is the case with every one but the last; but it will be readily seen that by this we miss some very important territorial changes, as, for example, Napoleon's Empire of 1810. The maps are, for the most part, entirely correct; we note, however, a few inaccurate details: B. C. 100, the red color of the Roman possessions should be extended over Illyria; A. D. 300 and 400, the Allemanni should be considerably further to the West; A. D. 400, the Vandals should be placed in Pannonia; also, A. D. 500, the Lombards in the same place, and the Gepidæ to the east of them; A. D. 600, the Avars should be further west, north of the Danube; A. D. 1000, Bulgaria should extend east to the Black Sea, and we are inclined to think also to the north of the Danube, although this is uncertain; A. D. 1400, the Turkish color should include Servie. Also, it would be more correct, A. D. 1, to extend the Roman color over the southern coast of Thrace, and, A. D. 100, not to have it embrace Arabia, which was not conquered until the time of Trajan.

Fine Arts.

WARD'S WASHINGTON.

THE apotheosis which precedes and founds any special hero-worship, logically justifies the idealization of its hero and a departure from the realistic type in commemorating him in art. The department of historical portraiture has essentially another scope from that which monumental art proposes to itself. We demand the last degree of authentication for form and feature in the picture or statue of a contemporary which is to take its place in the national gallery of distinguished men as a public document, as evidence which shall have absolutely scientific value. But when it is question of commemorative work in subsequent times, by men who have had access to no new testimony which could increase our knowledge of the hero's bodily appearance, the conditions of portraiture are abrogated. More than this, they become offensive to the artistic perception. Every hair's breadth of greater exactitude in Houdon's statue, every finer shade of resemblance, adds immeasurably to the value of the portrait, but if a Titian or Michael Angelo were now living, and had to paint or model Washington, we could extort from him, and would ask of him, no effort to repeat for us what Houdon and Stuart have left us of the proper personality. We should require of both of them to give us their conceptions of Washington's character and their artistic treatment of the theme; and the more sharply these varied, as between artist and artist, the more interesting and valuable to us they would become. If we want to show our descendants what Washington was like *as man*, we should ask neither Mr. Ward nor Michael Angelo to give us a statue, but make copies of Houdon's and place them in the chief square of every American city. That absurdity of the Pre-Raphaelite school which dreamed of establishing the actuality of past events and personages, instead of embodying modern ideas of them, is bad enough on perishable canvas, but in bronze and marble becomes the eternalization of absurdity. Imagine Michael Angelo going to Judæa to find a shepherd boy of the type of Judah, with muscles trained in slinging stones at the birds of prey, questioning his genealogy, etc., to get a model for his David! Yet this is simply the *reductio ad absurdum* of the pure doctrine of actualities applied to the monumental tributes to our immortals. And not only is this the case, but the higher the artistic powers of the sculptor from whom we demand a realistic statue, the more complete will be the failure of the work; for the artist of imaginative power, while he can find in the living hero all the inspiration he needs, and the character beneath the shell, is, more than any common plodder, dispirited and paralyzed before the inert cast in plaster and the suit of cast-off clothes in which he must find his ideal.

We have said enough to foreshadow and explain the opinion, which repeated examination of Mr. Ward's new statue confirms in us, that it does injustice to the artist even more than to the theme. Whoever is responsible for the attempt at actualization in the statue, whether committee or artist, is chargeable with the shortcoming; for it is due to the effort at the impossible involved in trying to get from an artist whose powers are peculiarly ideal, and whose way of approaching his subject is idealistic and in sympathy with the noblest standards of sculpture, a work on which the tailor and shoemaker of 1783 should set themselves up as critics. What we should have asked from Mr. Ward, and what alone he should have consented to give us, was not what the people who knew Washington by his shoe-buckles would have recognized, nor even what Houdon and Stuart would have accepted as the man *they* knew, but his own ideal of a man whom no one in times to come will judge by what he was in actuality, but by what success in one of the greatest of human achievements (following his own merit in part, but also profiting by the merits of his surroundings) has made him for us. Mr. Ward's failure grows chiefly out of the imposed necessity of attempting to realize a popular chief magistrate of 1783, in the costume of the time, rather than Mr. Ward's conception of a hero worthy to be the highest human object of veneration of the largest and, as Americans believe, on the whole, the most advanced of all contemporary nations. The artist's powers are equal to such an undertaking—in this statue they do not appear. It was not necessary to pose Washington in the guise of a Greek god or a Roman Emperor: his actual costume was as capable of heroic associations as those attributions; but it was necessary that we should see *Washington* in his costume, and in spite of it, and Mr. Ward has compelled us to see chiefly his costume rather than him. And, owing to the constraint imposed on his better powers by this subjection to the actualities, his treatment even of the accessories shows want of freedom and that grace which can only spring from complete liberty.

Coming to the statue from the East River, you see a clumsy and unpliant fold of mantle as the detail most in evidence. As actuality it is not true, and as grace it is not flowing. Looking at it from the southeast, you feel a certain protrusion of the left thigh and knee as if they were

about to make a step in a minuet, and the right hand is keeping time with it. This fault is purely, however, we believe, due to the evident fact that the statue was not studied in reference to its elevation, and that if looked at from a higher point of view the fault would disappear; but it is a grave one and the artist should have avoided it. The view from the south is the best, and apparently that for which the statue was studied; but when seen from a point near enough to make the detail visible, the best qualities of the *ensemble* disappear. From certain points the legs cross in an awkward tangle, which produces an uncomfortable impression, and which a Greek artist would never have fallen into, because position was an element which he would never have left out of consideration, and which the traditions of seven centuries had made a science so far as anything in art can be science. The head from a distance is fine, but too much raised for near view.

The Nation.

NEW YORK, THURSDAY, DECEMBER 20, 1883.

The Week.

THE selection of Chicago as the place for holding the Republican National Convention will meet with the general approbation of the party. Chicago has better hotel accommodations than Philadelphia, is more easily accessible, has a better summer climate, and is more cosmopolitan in all respects. Its superiority to Cincinnati and Indianapolis is even more decided. Saratoga is too small a place for such a gathering. If the Convention were to be held anywhere in the State of New York, this city is the only place fit to receive it. The action of the Committee in this matter appears to have been governed by considerations of convenience. It is not probable that the "local sympathy" of Chicago will have any perceptible influence upon the nomination, if indeed anybody can divine what direction it may take six months hence. Mr. Frye's resolution to change the basis of representation in the Convention was very properly referred to the Convention itself, a majority of the Northern States as well as of the whole body voting for the reference. The principle embodied in the resolution is the ideally correct one for the composition of such bodies, but it happens to be opposed to the uniform practice of the Republican party and of the Democratic party as well. The change, therefore, ought not to be made by any less authority than that of a Convention. It would be well (as the *Times* suggests) to change the basis of representation on the National Committee also. The advantage which Mr. Blaine's supporters derived in the preliminary organization of the last Convention from their preponderance of members from the Territories, was altogether factitious and unfair. The most important personage in the earlier proceedings at that time was the wide-awake member for Arizona, whose influence at the critical moment was decidedly greater than that of Pennsylvania, although the latter held the chairmanship of the body.

It does not appear that the Committee have made any change in the phraseology of the call, so as to "secure to the several Congressional districts the right to elect their own delegates." The call simply invites the qualified electors "to send for each State four delegates at large, and for each Congressional district two delegates, and for each representative at large two delegates." If this is the Committee's last word it has fallen short of the instruction of the last Convention on this subject. The instruction required the establishment of a mode which should secure the end in view. To secure a thing is to close up all the avenues to uncertainty. This has not been done as yet. The danger that any State will usurp the right to overrule its Congressional districts in their choice of delegates is, however, very remote. The resolution which Mr. Chandler offered, and which was adopted, extending the right hand of fellowship to all organizations which are pledged to free education, free suffrage, etc., is apparently intended to commit the party in some sense to a favorable view of the Mahone faction in Virginia. If such was the object of the resolution it cannot be regarded as especially helpful on the wider scale of national politics.

Every good Republican will be rejoiced to hear that the Committee of Arrangements for the Chicago Convention have decided that the next Convention will not be surrounded by the immense gallery of spectators which made the last Convention the scene of so much tumult and disorder. Accommodations were actually provided at that Convention for 15,000 spectators. Next year it has been decided to provide accommodation for only 3,000, so that at the outside it will not be possible for more than 5,000 persons altogether to witness or share in the proceedings. This will be a large enough assemblage in all conscience. In 1880 the crowd came very near either taking the nomination altogether out of the hands of the delegates, or breaking up the Convention in a scene of wild confusion. As long as human nature is what it is, it will be impossible for an immense meeting to carry on anything that can be called deliberation, or for a small body to deliberate carefully, in the presence of an immense meeting. Currents of feeling among great masses of men, when once started, rapidly acquire a momentum which no head is cool enough to resist, and find expression in noise of one sort or another which no voice is strong enough to dominate. Such scenes as marked the proceedings of the last Convention would, if frequently repeated, have deprived nominations made under such circumstances of all chance of acceptance by the voters, and have led to the contrivance of some new mode of getting candidates before the country.

It will probably be impossible, under any circumstances, to prevent the gallery from having a large share in determining the result after the more prominent candidates have been worn out and cast aside. When the moment comes for the unknown or "dark horse" to make his appearance, enthusiasm must tell and bring him to the front, and it will be impossible to confine enthusiasm to any one portion of a body of persons assembled in one room. Any emotion by which the delegates, or part of them, are strongly stirred, is sure to spread to the galleries, and anything that thrills the galleries is sure to spread to the delegates. There is no way of preventing this altogether, even if it were desirable to prevent it. Conventions will probably always, as long as the present nominating system lasts, have to be large bodies, and to sit in the presence of a considerable public; but there is a certain unfairness to that portion of the party which cannot go on to witness the proceedings, in allowing the outsiders who do attend to take so large a part in them. The candidate who can now bring most friends or followers into the building to "shout" for him, has a distinctive advantage over other competitors whose admirers stay at home, of which it is perhaps impossible to deprive him, but which is nevertheless regrettable.

George C. Gorham has been defeated as a candidate for Secretary of the Senate, and a good choice made in the nomination of General McCook. This will probably put an end to Gorham's "claims" upon the Republican party. He disappears in company with his stanch and congenial friend Mahone, who had cooled so perceptibly in his devotion that, when the time for voting arrived, he was able to make only a moderate speech in Gorham's favor. He did not threaten to bolt the caucus and take Riddleberger with him, as he did a week or so ago, in case Gorham was defeated. The conduct of the Senators in the matter has shown in a forcible manner the progress which civil-service reform principles have made within a few months. Their previous struggle over the Gorham issue lasted through many weeks, and was one of the most disgraceful of its kind ever witnessed in this country. This time a majority of them met the issue squarely on civil-service reform grounds, saying that, as they had passed a law establishing that reform, they could not be expected to violate it by electing such a man as Gorham to their most important clerical office. Even then the contest was a close one, for McCook had 19 votes and Gorham 13, with three scattering.

The bankruptcy struggle will be actively renewed at Washington this winter, and all who have the business interests of the country at heart must hope that some way will be found to reconcile the conflicting views which have made their appearance in Congress on the subject. Several publications have recently come out which seem to indicate that the Lowell bill of last year, with certain modifications, is more likely to pass than any other. Nevertheless, it may be inferred from a pamphlet published a few weeks since by Mr. D. C. Robbins, of the Chamber of Commerce of this city, that a vigorous attempt will once more be made to introduce into the bill a feature which he has much at heart—that of punishing bankrupts wherever it appears that they have been engaging in illegitimate "outside" speculation. He says:

> "A firm engaged in a legitimate commercial business, which goes out of it and speculates in other business and fails, ought to suffer a public penalty. Thus, if a hardware firm gambles in mines, a dry goods firm dabbles in real estate, a drug merchant embarks or speculates in produce or stocks, the money lost is not their own, but funds advanced by bankers and others on their notes, under the belief that they are doing a legitimate business. When they fail, the injury is not confined to the creditors; public confidence is shaken, support is withdrawn from other good firms, and workmen are thrown out of employment. Thus the ripple of one man's evil act extends till it reaches from the banker to the mechanic."

Now, what is the remedy for this and other frauds? "I say, a severe law with a highly disciplinary code. Why do you punish the

man who steals your watch, and let him off scot free who buys goods he never can and never intends to pay for?" The Lowell bill, as amended by the Senate Judiciary Committee, contains a pretty long list of crimes in connection with bankruptcy, one of which is obtaining goods, etc., on credit with intent not to pay for the same; the maximum punishment for which is hard labor for three years. Mr. Robbins's idea apparently is that this clause ought, in good law and morals, to be stretched so as to cover any sort of speculation outside the limits of the bankrupt's regular business, and he suggests the novel theory that all money used in this way must come from advances obtained by means of false pretences. But why so? It *may* be that such is the case, and then there would be every reason for punishing the trader. The crime he commits, however, does not consist either in his speculation or his failure, but in his misrepresentation of the purpose for which he borrows the money. But, if a firm or individual, engaged in the coffee business, for instance, has some money lying idle, which, owing to the condition of the coffee market, it cannot do anything with in coffee, and it takes a "flyer" of some sort in stocks, and afterward fails, there is no obtaining money or money's worth under false pretences, nor any criminal act, so far as we can see. The risks taken may be even less than the risks in the coffee business. No bankruptcy act which involves or suggests the idea that speculation is a crime, is likely to get through Congress.

In two weeks more, the year 1884 will open, and the almanac meteorologists will lift up their voices and foretell the weather, the earthquakes, the tornadoes, the fevers, the plagues, and the dynamite explosions for the next twelve months. The Theosophists, we see, are trying to get ahead of them this year, and a member of the sect has given the *Herald* the straight prophetic tip, by declaring that the green suns and moons which every one has been so puzzled by lately show that "we are just at the end of a cycle—one of the smaller cycles." We can hardly be at the end of one cycle without being at the beginning of another, and the fact is that "we are about to pass from one of the smaller cycles to another"—the great cycle—at the end of which comes a temporary return to chaos, or Pralaya. In 1884 there will be "upheavals of the sea and volcanic outbursts." This is a very meagre showing. We can add a point or two ourselves. There will be another investigation of the Keely motor; in financial circles some stocks will rise and others will fall; those which are expected to fall will rise, and those expected to rise will fall; "weak holders" will be shaken out, lambs fleeced and devoured; wolves will lick their chops over the savory morsels. In politics "dark horses" will develop into favorite sons, and favorite sons drop out because they fail to show an ability to carry the doubtful parental State; the editor of the *Sun* will be nominated by an esteemed contemporary for the Presidency, and will explain why the position he occupies at the head of that paper makes it impossible and unwise for him to think of accepting the place. The circulation of all papers will continue to increase day by day, although several dozen will suspend publication for want of support. Many clergymen will discuss the Mormon problem, and the divorce problem, and the Chinese problem, with the same effect noticed in 1883.

The Bostonians have escaped from what, to many of them, was the great horror of having an O'Brien for Mayor. What may be called the Irish-Butler ticket, which was headed by a gentleman of that name, has been defeated by a majority of 1,543. It is a great escape, though it must be confessed a narrow escape. Such a majority as that in a vote of 53,537 cannot be called a very reassuring victory, especially as there is no doubt that the strength of the O's and the Mac's in Boston is increasing more rapidly than that of pure-blooded New Englanders. Nevertheless, small as it is, it may prove considerable in its results, because it may, and doubtless does, mark a turn in the tide which will next year show that Butler has lost his hold on the State as well as on the Democratic party. It will certainly encourage the old Democratic leaders in their resistance to him, thus forcing him to rely, in his political activity hereafter, upon the labor organizations alone. The mere fact, however, that an O'Brien came so near being Mayor of the great Puritan city as to frighten the Boston people very much, is a striking illustration of the way the sins of the fathers are visited on the children, not only unto the third and fourth generation, but sometimes unto the ninth and tenth. It is largely owing to the sins of the forefathers of the New England people that Irishmen are Catholics and not Protestants; that they are ignorant and excitable, instead of being intelligent and sober-minded; that they have but little political sense; that there exists a deep antipathy between them and Anglo-Saxon Protestants all the world over; and that O'Brien is a more hateful or more dreaded name in politics than Campbell or McGregor.

Mr. Arnold's lecture on Emerson has furnished an opportunity in Boston for a good deal of criticism of Mr. Arnold himself. The Rev. Mr. Bartol declares that while "ingenuous," Mr. Arnold is still "foreign;" that the "critical telescope" "he brought over with him is of insufficient power to take an observation of Emerson; and that it is owing to the weakness of the glass that he reports the philosopher as a star of only the "second or third magnitude," a question for the settlement of which Dr. Bartol thinks some centuries are needed. But this is not especially true of Emerson. In this sort of astronomy, no judgment is final, and any one who can do so is at liberty at any time to revise Mr. Arnold's estimate of Emerson as a modern Marcus Aurelius. We may say the same thing even of Mr. Bartol's criticism of Mr. Arnold's telescope. If he can prove that he has a better glass, there will be a rush from the Arnold to the Bartol observatory. An astronomer who is undevout is handicapped to begin with, and if he has a poor instrument and keeps misreporting stars, and crying out: "Look! look! there goes Marcus Aurelius!" when in fact it is impossible for him with his glass to know whether it is Marcus Aurelius, or Socrates, or Plato, he is sure to be found out in the end.

The Salvation Army has met with great success in New Haven. Not only has it been investigated in court by a judge who has decided that its street singing is not a "disturbing noise" within the meaning of the Connecticut statutes on the subject, but it is declared by the Rev. Dr. Houghton to constitute a "problem," and the reverend gentleman has promised to preach on it, just as he might on the Mormon problem or the divorce problem. A problem, as we understand the matter, is something which excites a good deal of social interest, but as to which nobody has anything definite to propose, and which therefore permits of an indefinite amount of discussion in the pulpit, the press, and the "rostrum."

An attempt, it seems, is shortly to be made to test the constitutionality of the New England system of individual responsibility for town debts. In several, if not all, the New England States, private property may be taken on execution and sold at public auction, to satisfy judgments against towns. A Mr. Eames, of Embden, Maine, has lost some property in this way at the suit of a neighbor, and he insists that the proceeding violates the Constitution of the United States, as it is taking property "without due process of law." He proposes to carry the question through all the courts, to Washington if necessary. Should the courts decide in his favor, on this ground, it will be something of a legal and judicial surprise, because it has always been taken for granted in New England that levying on property in this way is part and parcel of the "due process of law" which the Constitution guarantees.

Another attempt, this time in Ohio, to try a prisoner, extradited from Canada, for an offence other than the one for which he was surrendered, has broken down, the Supreme Court deciding, as so many other courts have done, that such a practice is in violation of the right of asylum and also of the treaty with Great Britain. The case is a strong one, because the crime for which it was proposed to try the man was one for which he might have been extradited; that is, it was a treaty crime, and the State had obtained jurisdiction of his person by perfectly regular extradition proceedings directed against another treaty crime, and had sent him to jail by means of them. Nevertheless, it was held that all further proceedings against him must be suspended until a "reasonable time" after the expiration of his first sentence, when he will doubtless set all questions at rest by leaving Ohio. The same general view of the subject has now been adopted by so many judges that the State Department will probably have little trouble over it with foreign governments again.

Of the $62,000,000 of Government bonds called for redemption in the 121st, 122d, and 123d calls of the Secretary of the Treasury,

there have been about $50,000,000 presented for redemption within the last sixty days. A small portion of the capital in these redemptions has gone to Europe, and a larger amount has been due to the national banks, which have retired circulation to a corresponding degree. But the great proportion of the $50,000,000 has come into the market for new investment of some kind, and in this is to be found one of the causes of the continued plethora of unemployed money, which keeps the rates of interest down to lower figures than were ever known before. Moreover, capital still holds aloof from railway stocks and bonds. The latter, indeed, are yet regarded with some favor, as the last two months have shown, but the supply of satisfactory securities of this class has been limited. The expansion of the railway system, the intense competition, the continued troubles in the various railroad pools, and the declining prices of even the dividend-paying stocks, have made investors timid even in regard to first-mortgage bonds.

Steel rails have during the past week sold at $30, which is $10 50 below the lowest price reached after the panic of 1873, and is within $5 of the price at which foreign steel can be sold in this country, or, in other words, at which any protection whatever would be necessary to the American manufacturer. Of course, this is not likely to last; the price will go up again, but probably not very much. If revenue reformers by their doings had brought about this state of things, what an outcry there would be. It has, however, occurred under a highly protective tariff and in the twenty-third year of the greatest protectionist experiment. Some adequate explanation of this which will not damage the protective theory is highly desirable, from some quarter.

Mr. Blaine's annoyance over the unfavorable reception which the country has given his tax-distribution scheme is explained in a very interesting way by his friends. They say he has been misunderstood because the point of view from which he spoke has been misapprehended. The whole country regarded his utterances as a bid for the Presidency, when in reality they were nothing of the kind. They were merely the reflections of a Sage—that is, of a man who would not consent under any circumstances to be a candidate for the Presidency. Anybody can see what an important distinction this is. What seems like claptrap when uttered by a Presidential candidate, becomes pure statesmanship when uttered by a Sage. We trust the country will bear this in mind in considering further utterances from the same statesmanlike seclusion. Mr. Blaine can do a great deal toward preventing misapprehension by timing his deliverances at less critical political moments. If he does not speak again, for example, till after the National Republican Convention, nobody will misunderstand him.

O'Donnell was hanged on Monday morning, as he richly deserved to be, but not before Mr. Lowell had been instructed to convey to the British Government our disapproval of their system of appeal in criminal trials, and our desire that the proceedings at such criminal trials as we feel an interest in should be submitted to our Government for revision before the sentence is carried into effect. It is true Mr. Lowell did not say this exactly, but the reason he gave for our interference in the O'Donnell case, that inasmuch as there is "in Great Britain no judicial examination on appeal of the proceedings at a criminal trial, possible errors can only be corrected through a new trial, or by executive action on the sentence," of course would apply to any other case whatever in which a delegation of Congressmen or a resolution of the House of Representatives demanded our interference. The statement was, in point of fact, incorrect, inasmuch as the proceedings in any criminal trial are reviewable by the full bench, whenever the judge who presides at the trial certifies that any point raised at it is doubtful. All things considered, the request was probably one of the most extraordinary made in recent times by one civilized state to another living under the same jurisprudence, and it is the more extraordinary because it is the second request of the kind that has been made within two years. There is no patriotic American but must be a little ashamed to see the Executive conniving at or assisting in the attempt made within the last few years by the Irish malcontents, to treat cowardly and brutal murderers as objects of sympathy and even admiration.

The complaint made against Mr. Justice Denman, who presided at O'Donnell's trial, by General Pryor, on his arrival home, that he unfairly "put the halter around O'Donnell's neck" by telling the jury that there was not a particle of evidence that Carey had a pistol when O'Donnell shot him, has apparently no justification whatever. The remark was made in answer to a question of the jury when they came back into court after a long period of consultation. The question was, whether O'Donnell's offence could be pronounced manslaughter if Carey had a pistol. It showed that some of the jury believed that such was the case, and that they were hindered from making up their minds by such belief. We think it was undoubtedly the duty of the Judge, under these circumstances, to tell them that there was no foundation for it. No evidence was produced at the trial, either by the prosecution or defence, which left any doubt whatever on this point. Two of the ship's crew witnessed the murder, which was thoroughly cold-blooded. O'Donnell began shooting at Carey without the slightest warning, while he (O'Donnell) was sitting beside his wife, or the woman who passed as his wife. Carey made no attempt at resistance, and neither produced nor attempted to produce a pistol. No weapon was found on his body, and his son testified that after the shooting he went into the cabin and got his father's pistol out of a bag, and it was found on him and taken from him by the ship's officers a few minutes later. If, therefore, the Judge's remark "put the halter round O'Donnell's neck," it was because justice required him to do it.

The experience which the French are having in Anam strikingly resembles in some of its features that of the British in Afghanistan. They set up a new king last summer, after they had bombarded Hué and driven out the legitimate sovereign recognized by the Chinese, Van Lian by name, and extracted from him the treaty of the 25th of August, by which they set great store, because practically it gave them possession of the kingdom. He has now been poisoned, it is supposed by Chinese emissaries or by the anti-French party among his own subjects. This recalls the two attempts of the British, under somewhat similar circumstances, to set up kings of their own in Afghanistan. In 1839 they forcibly seated upon the throne Shah Soojah, who was soon after assassinated by his new subjects. In the last war they set up another, Yakub Khan, but he had soon to abdicate and take refuge in their camp. In fact, the plan of manufacturing kings for the government of conquered dependencies without supporting them with a great army is a mistake, and it generally ends in failure. In India the British usually leave the legitimate sovereign in control of the dependent states, and keep an officer at his court to watch him, and a considerable military force within an easy reach to frighten him. This assassination is a sign that the resistance of the Chinese and natives to French occupation is by no means over in Anam.

It is now nearly a month since the defeat of Hicks Pasha, and none of the dreadful things which the panicmongers in England predicted from it have come to pass, or show any sign of coming to pass. The London *Spectator's* prediction was that within one month the French would "be fighting for their lives from Gabez to Morocco." The month has nearly expired, and there is as yet no sign of any trouble in Algeria at all, although the Governor-General has asked for a small reinforcement of about ten thousand men as a precaution. The *Spectator* has since begun to hedge a little by suggesting that the False Prophet's emissaries have not had time to get around with the news even on swift dromedaries. But the probability is that the emissaries are really in no haste at all, for the simple reason that they have no very important news to carry. Every additional detail received from the Sudan goes to show that, as we said at the time, the Mahdi's forces were made up in the main of bands of slave-dealers, whose fanaticism, religious or other, consisted solely in exasperation at Egyptian interference with their business, and that, having had an easy victory over a small body of worthless Egyptian troops, they show no disposition to campaign any more. By the last accounts the Mahdi's forces have been greatly reduced, if they have not altogether dispersed, and the panic is everywhere subsiding. A recent article by Sir Samuel Baker, who is perhaps the highest authority on the subject except "Chinese" Gordon, shows, indeed, how little ground there has been for the idea that we were witnessing in the late events in the Sudan the beginning of a great Mussulman revival.

CHRISTMAS PRESENTS.

THE approach of the day which brings with it so much mingled hope and dread—hopefulness over dreams of what we may receive, and dread at the thought of what we shall have to give—seems to make a few reflections on the subject of Christmas presents appropriate and, it may be, consolatory.

Christmas brings with it so many associations of all kinds, that it is difficult to guess exactly what we should think of the festival if it were simply a day set apart for giving and receiving presents within the limits of the family. This is what Christmas presents mean nowadays, for though no one is bound to confine them to these limits, they are for practical purposes strictly observed. With ninety-nine persons out of a hundred, the toil and fatigue and responsibility involved in the selection of presents for the considerable number of persons to whom they must of necessity be given, is sufficient to weary them with the task before they have completed it; and when it comes to the turn of the old friends and school and college mates—to whom in the course of the year we often think, in the fulness of our hearts, how pleasant it would be to give something at Christmas—we usually fall back on Christmas cards, which constitute one of the most precious and at the same time inexpensive contributions of these latter days to the neglected cause of sentiment.

There are two serious difficulties which arise in everybody's mind, in connection with Christmas presents—to know how much to spend, and to know what to get; and the latter branch of the subject is the one which, in the United States at least, is much the more serious of the two. Few people who give presents at all would find half the trouble or annoyance in the matter that they do, if they had once a year to draw a check for a certain amount which they could afford to spend on such an object, and hand it to an agent to distribute among the "beneficiaries." This is exactly what most people do, or did until within a few years, in the case of what they gave for charity, and there never was anything in Christendom so popular, in its way, among the best people, as a charitable subscription list. But the charitable method will not do at Christmas. You have got to give a certain amount of time and thought to what the person to whom you give your present wants. There is probably in a selfish world like ours nothing more intensely irksome than this sort of responsibility. You may, of course, to a certain extent, give your friends merely what you like yourself. This is done every Christmas by very estimable people. You may, if you are a girl, for instance, give your father one of those nice plush chairs in which you look, when seated before the fire over five o'clock tea, so pretty and picturesque, but in which the old gentleman, could he sit at all, would look and feel singularly uncomfortable; or you may, if you are a boy just growing up, with a taste for firearms, present the old man with a bull-dog pistol. Or, better still, you may procure yourself a good deal of innocent pleasure by giving a present of a sort which enforces a moral lesson. Everybody who has read Miss Edgeworth remembers the story of the little child who gets, as a present from his kind mamma, one of those noble colored vases which have from time immemorial made brilliant the windows of apothecaries' shops, only to find on taking it home that it is all a fleeting show, the illusion of which disappears when the contents are poured out and the light removed from behind it. This, however painful to the boy, shows him very neatly how to discriminate between the true and the false in nature and art. So, at Christmas, every body has known of presents given as little reminders that the lives of great men are always marked by industry and application—books, when what we long for is skates and a sled; or a microscope or electrical machine, when what we have dreamt of for months has been neither more nor less than that most delightful of all gifts to boy or man—hard cash. The unwillingness to give presents in the form of money does not come really from any supposed general unwillingness to receive money, but partly from the fact that, except with children and savages, a present in this form, to look well, has to be rather larger than if we give money's worth, and in great measure because people are unwilling to relinquish the right of selecting for you what you are to receive. Alas, alas, how little altruistic the best of us are, even at the most altruistic season of the year, if we will not, in giving Christmas presents, first think of the pleasure of the receiver rather than the gratification of our own whims and self-love in giving.

The reverse of this is to be found among the receivers, who are, it is hardly necessary to say, neither more nor less selfish than the givers. Does not everybody know some one whom it is impossible to really please with any gift, simply because the person in question has not had the selection of it, yet who would still be displeased, even if that were the case, with the result? Such persons we have known among the very best of their respective sexes—the salt of the earth in every other respect, but absolutely unappeasable as to presents.

The family limits constitute another difficulty about present-giving at Christmas, which every one must feel. If the exact degree and proportion of family affection in every little circle could be manifested in the presents given—if this rule could be introduced as the latest Christmas "novelty"—there would be a great deal of excitement and amusement in many a family circle over the result. But bad passions would also be aroused, and probably the festival itself would not long survive the change. For ourselves, much as we like the opportunity which Christmas affords, and fond as we are of the old holiday, we confess to sometimes regretting that any special day in the year should be set apart for present-giving. Do not most generous and considerate natures feel as to this somewhat as no one fails to feel sometimes with regard to wedding presents—that our lives would be richer and fuller and more spontaneously generous if no day were set apart at all and there were no laws on the subject, but every one gave just as some denominations of Christians pray, only when the act represented a genuine sentiment—the desire to benefit the receiver—and not a custom covering all kinds of hypocrisy, and hardness of heart, and selfishness? Ought not sentiment to be entirely freed from the shackles of custom? Why should days be set apart for its exhibition? Many a time in the course of the year have we reflected what presents we would make and at what odd and unexpected times; how charmed and surprised the receiver would be; how his heart would bubble over with gratitude as he opened the package and recognized with amazement how generous, how unsparing of our limited means we had been! Yet we must admit, as we have already said, that there is something which interferes with our introducing the pleasant innovation of occasional giving. Why do we stay our hand on its way to our pocket? Is it because the fiend within us whispers, Put it off till Christmas? But when Christmas comes, for some reason we fall into the old rut, and stay the qualms of conscience by posting a card, receiving one most probably by the mail which takes our own—for it is one of the marvels of Christmas how nicely proportioned what every Christian receives is to what he gives.

A RADICAL REMEDY FOR POLYGAMY.

THERE appears to be a general determination to try anything which the Constitution will permit in order to put an end to Mormon polygamy. Some people, including one or two clergymen, indeed, seem disposed to try things which the Constitution will not permit, such as sending troops to dragoon the Mormons into monogamy, in the old-fashioned Louis Fourteenth style. Of course, however, the sober second thought of the American community will allow nothing to be done which humanity and reasonableness, as well as the principles of our Government, do not sanction, however determined it may be that a self-governing polygamous community shall not be permitted to exist in the centre of the Union. What is most curious in the anti-polygamy agitation thus far, however, is that the remedies proposed are so mild, and so likely to be ineffective, that, coming after the ferocious denunciations of polygamy which we so often hear, they sound sometimes a little ludicrous. The polygamist, for instance, after being reprobated almost as if he were a wild animal, is then threatened with some such penalty as a constitutional amendment forbidding him to have more than one wife, or with the loss of his vote, or of a seat in the Legislature; as if a man who greatly cared about these things would be a Mormon at all. The great difficulty of the Mormon problem lies in the fact that the Mormon people are not eager to share in our political privileges, defy our public opinion, contemn nearly all the sanctions by which our domestic morality is enforced, and wish of all things to be let alone by us.

The subject of prevention has now, however, taken such a strong hold of the popular mind, that a series of legislative experiments has been entered on which will probably not cease until some decisive result has been reached. It is in the highest degree desirable, however, that this process of experimentation should be as short as possible, or, in other words,

that too many remedies should not be tried. In making laws about the matter, we ought, in truth, to go to the root of the difficulty at once. No Mormon can commit polygamy without the aid of at least two women, and those who wish to be thorough, should, it seems to us, go to work at once to cut off the supply of women from the Mormon community. A few years ago this would have seemed, perhaps, a startling absurdity, but it cannot be so considered since the anti-Chinese legislation which has been resorted to on the application of the people of the Pacific coast. Under that we have actually undertaken to exclude from the United States the inhabitants of a great empire for no better reason than that they worked for too small wages, and that their standard of living was low. The principle of excluding foreigners as a remedy for social or political evils having been thus deliberately adopted, the principal argument against applying it to the destruction of polygamy seems to be overturned. The foreign population of Utah amounts, in round numbers, to 44,000, out of a total of 143,963, and is about equally divided between the two sexes. The census does not tell us what proportion the Gentiles bear to the Mormons, but it is almost certain that the foreigners are mostly Mormons, and that it is through the ingress of foreign women that the institution of polygamy is kept up. There is a good deal of suggestion and instruction to be found in an examination of the sources from which the supply comes. The great body of foreign Mormons come from England, Scotland, Wales, Denmark, Sweden and Norway. England has supplied, in round numbers, 20,000 of them; Scotland, 3,200; Wales, 2,400; Sweden, 3,750; Denmark, 7,791; Norway, 1,200; Ireland, 1,300. About the character of this British and Danish contribution there is very little doubt: both the men and women belong to a low, ignorant peasant class. The same thing is true, though probably in a less degree, of the Scandinavian contribution. Now, what is the objection, constitutional or other, to preventing absolutely the entrance into the Territory of alien women of this class for as long a period as may be necessary to reduce the supply so low that polygamy would perish through the mere lack of materials? The enforcement of such legislation, too, would be very simple. No disguise is possible for foreign female immigrants. The points at which they could enter the Territory are not numerous. The women who are already in the Territory, whether native or foreign, can easily be registered and identified; from all others passports might be exacted and expulsion follow the failure to produce them, in any case in which the frontier had been passed without detection.

All this, we admit, sounds a little grotesque, but the whole Mormon question is grotesque. Nothing can be odder than that the American people, considering what its history and antecedents have been, should, in the hundredth year of the national existence, be puzzling over the best mode of getting rid of a polygamous community living under a sacerdotal government. In dealing with such a community many of our most cherished political habits and traditions have necessarily to be cast aside. A polygamous Mormon household is a thing of itself so archaic and un-American that it cannot be got rid of by modern American remedies. The treatment of it has to be, as it is itself, somewhat Oriental. In short, we must tell a man who wants too many wives that we will not let him have any women.

THE JUDGE AND HIS DRESS.

THE suggestion made by the Bar Association, or some of its members, that the judges of the Court of Appeals should, on taking possession of their new court-room in the Capitol, adopt robes as their regular costumes, does not seem to attract much hostility in any quarter. Even the *Sun*, which can smell a monarchist as far as most papers, declares, after pondering the matter for some time, that a costume that has always been worn by the judges of the Supreme Court of the United States is hardly open to criticism on the score of being undemocratic. This is itself a good sign for those who have this little piece of æsthetico-judicial reform in hand, inasmuch as the great obstacle in the way of introducing any official costume for any class in the United States is the feeling that, innocent as it may look, it is really an "entering wedge" of the monarchists—a party which is, of course, all the more dangerous in a republic like ours because it does not avow its objects, or ever call any primaries, or mass-meetings, or hold conventions, or set up a press, but apparently consists of a number of wealthy people who like Europe more than they do their own country, and are therefore presumably engaged in a plot to substitute European for our own institutions. To judge by the sort of conversation in which American monarchists indulge, when they are quite safe and alone, it would be just like them to begin to undermine the Constitution by agitating for a return to the custom of the President's wearing ruffles, and addressing Congress in person, or to the judges going on circuit in a coach-and-four instead of by rail, or any other quaint little bit of social bric-à-brac of this sort. When liveries were first put on American footmen, when the railways and the post-office first adopted a uniform, the anti-monarchist press of the United States was quick, if we remember right, to sound the cry of alarm, and expose the nature of the designs which lay behind the apparently innocuous innovation. It is therefore very satisfactory to find a Republican organ like the *Sun* frankly admitting that republics after all are not overthrown in this way, and that, therefore, the bench of judges listening to points and authorities brought to their notice by counsel, though it may be more impressive, will certainly not be any fuller of peril to our institutions if the judges are clothed in long black gowns, instead of the ordinary sack or frock coat of the citizen.

The modern judge's costume is part and parcel of the modern judge, and the only objection that we can think of to the proposed change is that in the Court of Appeals more dignity and impressiveness are hardly needed, and that in the courts where these qualities are often sadly lacking—in this city, for instance—there would be small chance of gowns being adopted, or of their having much effect if they were adopted. We have known, for instance, a good deal of trouble among some New York entertainers of a visiting lawyer caused by his expressing a desire to see a New York police court. When they thought of the magistrate whom the guest would not only see, but with whom he would probably be invited to sit upon the bench; when they thought, too, of the general want of decency and decorum he would be likely to witness, the jocular and even burlesque tone given to the proceedings by the judge, and the indifferent and reckless routine by which the cases would be disposed of, they were in a good deal of a quandary as to what they had better do, and it was finally suggested in despair, and to save the credit of our institutions, that the visitor might be taken into the United States Circuit Court, and be informed that this was what corresponded to a police or magistrate's court in other countries.

As a general rule, American State courts of last resort are dignified bodies as it is, because they do not engage in the trial of cases. The judges merely sit and hear arguments upon "points." Beyond the enforcement of a few simple rules, which are generally matters of routine, as to length of time occupied in argument, the right to open and close, etc., they have nothing to do, and need not open their lips. Even their decisions are generally "handed down," not read; and while hearing cases they are not even called upon to ask questions of counsel. We have never heard the Court of Appeals complained of for want of dignity. It is in courts which not only engage in deciding points of law or fact reserved from a trial, but sit, with or without juries, to try cases, that the absence of dignity, decorum, and sometimes decency is most noticeable, because it is in them that the hottest passions are aroused; clients, witnesses, and their friends being all present and full of fight. To preserve order and dignity in a court-room of this kind is a serious matter for any judge, and it is the misfortune of our system of electing judges that to preserve his popularity and keep on the bench the judge is always made to feel that he must keep on the safe side of everybody; every one in court who is fighting before him having a voice in saying whether he shall stay on the bench. That a long gown would give a judge of a trial-court under these circumstances a sort of Dutch courage to maintain, in some cases, a greater degree of dignity, may possibly be. But the reformers who have taken the matter up ought not to overlook the fact that it is such courts as the Supreme, the Superior, the City, the Police Courts—that is, trial-courts all over the country—which need all the aid that clothes can give them, far more than such a tribunal as the Court of Appeals.

BARRISTERS AND ATTORNEYS IN ENGLAND.

LONDON, December, 1883.

WE are interested to perceive by your newspapers that the visit of the Lord Chief Justice has revived in the United States the considera-

tion of the respective merits of the English and American systems of the organization of the legal profession. The matter well deserves to be weighed; but those who on your side suppose that Lord Coleridge, or any other single person, however influential, could bring about any change in our English arrangements, are mistaken, for those arrangements are deeply rooted in the customs of the country. I am not assuming that Lord Coleridge has been convinced of the superiority of the American plan; but even if he were, and if all the eminent judges and barristers who have this year visited the United States agreed in such an opinion, we should still be a long way from altering a system which has so intertwined itself with the habits and thoughts of our people.

Your readers probably know that in England the barrister has the sole right of audience in all the Superior Courts—that is to say, in the High Court of Justice, the Court of Appeal, the House of Lords, and the Privy Council—as well as in the old local courts of record, some of which still survive. His services are supposed to be purely honorary, and therefore he cannot be sued for negligence in the conduct of legal business, however serious the loss which his negligence may cause to his client, while for the same reason he cannot recover his fees by process of law, not even if he has made an express bargain regarding the remuneration to be given him. He is not permitted to enter into a partnership either with an attorney or with another barrister, nor does he receive business direct from a client, but only (with certain not very important exceptions) through the intervention of an attorney. His position is, therefore, both worse and better than that of an American lawyer—worse, in that he depends entirely upon the favor of the attorneys, and cannot get on except by being known to them; better, in that he is supposed to have a somewhat higher social status, is not liable to pay damages for any mistakes he may commit, and is relieved from some of the more troublesome parts of a lawyer's duties. Among these last must be reckoned the getting up of a case for trial, examining accounts, inspecting documents, collecting evidence, seeing the witnesses.

American lawyers find it hard to understand how a case can be properly conducted in court by a counsel who sees the witnesses for the first time when they step into the box. They fancy that he must find it difficult to examine them properly, must omit some material points and stray on to dangerous ground by putting questions which had better have been let alone. They conceive that there must be considerable loss of time, waste of power, and general risk of inaccuracies and mistakes when the collection and presentation of a large mass of facts are divided between two sets of persons—a firm of attorneys and a senior and junior counsel. These difficulties are much less felt in English practice than any one unfamiliar with it could suppose: partly because they apply equally to both sides in a contested case, partly because our counsel acquire a practical dexterity in handling witnesses which enables them to guess pretty correctly what it is safe and what it is unsafe to ask a witness. Sometimes, no doubt, there is a miscarriage of justice, but there are also advantages in having the case presented by a person who brings a fresh mind to it, and who has not become too much identified with the client and the client's ideas and feelings, as a zealous attorney is apt to be. Even supposing, however, that the American plan is better calculated to bring the whole matter fairly before the court, and admitting that it ought to be more economical of money and time than the English, it by no means follows that it is likely to supersede that which has been so long established among us. Let me attempt to indicate the obstacles to a change.

There are three classes of persons by whose exertions a change might be brought about—the public, the attorneys, the barristers. Is any of these three classes likely to desire the fusion of the two branches of the legal profession into one, or, if it has such a desire, likely to be able to effect it?

The public can of course do what it likes, for England is a free country. But the public does not understand the matter. It is, and with good reason, afraid of the law and the lawyers, for a man has to pay very dear with us for any dealings in that quarter. Our system of procedure and the means of setting it in motion are still so complicated that few people know exactly how business is divided between the attorney and the barrister, or could estimate the advantages of uniting their functions in one person. A lay reformer, a man who attacks the matter from outside, would be apt to be tripped up somehow by the lawyers, who would expose his ignorance of technicalities. And the gain to the community is one which seems, to the mind of an ordinary man, too remote to be worth fighting for. You could not get up any political excitement about it, or put pressure on members of Parliament to vote for it.

As regards the attorneys (or, as they are now more frequently called, the solicitors) the case is different. Not only do they know all about the matter, but they have a distinct interest in placing themselves on a level with the bar, for by doing so they would not only improve their status (though the line between the two branches is far less marked than formerly), but would obtain access to larger incomes, more opportunities of distinction, and to the highest judicial office. (An individual attorney can of course become a barrister, but to do so he must cease to be an attorney, and lose several years in the process.) Stimulated by this prospect, several active and ambitious men among the attorneys have of late years mooted the question, and endeavored to bespeak the sympathy of their brethren for their demands. But the profession as a whole does not respond. Those who are now in practice feel that success might not be attained in time enough to make a difference to themselves, and have too little corporate spirit to care for benefiting their successors. Many, probably most of them, are pretty well satisfied with things as they are. They know their own work, and do not seek to have that of the barrister thrown upon them. If the profits of their occupation never rise to such large amounts as those of the most famous leaders of the bar, failure is less common in proportion among them than among barristers, a great number of whom never make an income and quit the profession in disgust. They are a more conservative class, especially in all legal matters, than any other class in conservative England, and they consider that things have gone on excellently heretofore. Moreover, many of the more prosperous among them have started a brother, or a son, or a son-in-law as a barrister, and by employing him to do their court work they serve their family and personal interests just as well as if they were themselves barristers and he their partner. On the whole, therefore, there is little prospect of a strong agitation among the solicitors.

As respects the bar, they have no motive for seeking a change. Some of them may think it would benefit the public, but more will conceive that it would injure themselves. Apart from all selfish grounds, many barristers believe that the honor and dignity of the bar, the character of its members for probity and purity, could not be so easily maintained if it were swallowed up in the much larger mass of solicitors. As a comparatively small body, centralized in London (for seven-eighths of the practising barristers reside there), it can be made amenable to rules of professional etiquette, which serve to keep it out of temptations that are daily increasing as the bribes which wealth can offer for unprofessional conduct are always growing larger. The solicitors are, as a rule, respectable men, and any grave dereliction from duty among them is pretty promptly dealt with and punished by the judges, on the application of their central organization, the Incorporated Law Society. But they are removed from direct contact with the courts by the right of the barristers to exclusive audience, and they have much less direct power in Parliament, and through Parliament on politics, than have the barristers. It is, therefore, argued that both the judiciary and the legislature can be more easily preserved from the assaults of rich and unscrupulous men or cliques, if two sets of persons, first the barrister and then the attorney, are interposed between the courts and Parliament, on the one hand, and the dangerous influences on the other. It is also argued that it is easier to maintain a high level of professional learning and sagacity among the comparatively small number of leading barristers than it would be if the business which they conduct were scattered through the much greater number of persons who would probably share it were the distinction between the two branches removed.

These arguments may seem speculative and far-fetched. They are used by persons of a speculative turn of mind, because the proposal to fuse the two branches has not yet entered the arena of practical politics. Were it now raised, it would encounter much opposition from the barristers, who are strongly entrenched in English society. It would have little chance of being carried at present. But the process of democratizing our political institutions, which is going on fast, and seems likely to go on still faster, will involve sooner or later a democratization of other institutions likewise, and then the dislike of privileged classes, and the tendency towards what is called simplicity and equality, will threaten the pretensions of the bar. Nor must it be forgotten that there is among our people a sullen, silent discontent with the expensiveness of law, which makes wise men prefer injustice to litigation. If once the public are persuaded that the abolition of bar privileges would lead to the cheapening of all kinds of legal business, they would begin to desire it and insist on having it. Whether the experience of America proves that such a cheapening would really result, is a point on which we are still insufficiently informed. In New York, at any rate, we are told that litigation is as costly as in London.

AN ENGLISH LAWYER.

THE GOVERNMENT OF IRELAND.

DUBLIN, December 1.

THE interests and events of every day so forcibly claim attention, that we are too much tempted to devote our time to their consideration. But the province of correspondence such as this should be rather to give the causes which underlie passing incidents and developments. I therefore propose briefly to draw the attention of your readers to the Government of Ireland, general and local.

The Government of Ireland is practically in the hands of a Lord Lieutenant and Chief Secretary, appointed by the Ministry in England, and retiring from office with them. These two governors are assisted by a Privy Council of 52 members. This Council, whose numbers are less

ened from time to time by deaths, and kept up by the retention upon its roll of past Chancellors and Chief Secretaries, and certain of the judges, is permanent in its constitution and traditions. Its deliberations are private. The staff through which it works, from the Under Secretary downward, is also permanent. Liberal and Conservative ministers may rotate in office and send over their Lord Lieutenants and Chief Secretaries, but the instruments by which these men work, the persons through whom they are likely to be advised as to the condition and wants of the country, continue permanent. The Under Secretary, Thomas H. Burke (an Irish Catholic), so foully assassinated by the Invincibles, practically held the strings of Irish administration in his hands through many ministries. The Privy Council of Ireland consists at present of the Prince of Wales and Duke of Cambridge, the Protestant Archbishops of Armagh and Dublin, the Lord Chancellor, fifteen noblemen from Dukes to Lords, fifteen past Chief Secretaries, Lord Chancellors, etc., fourteen judges and law officers of the Crown, two past and one present commanders of the army in Ireland. You may suppose Ireland is rid of Mr. Forster, perhaps the most unpopular British official in Ireland in our time. Not at all. He is still in the Irish Council, and, whatever the etiquette may be, he has as much right to advise and vote as Mr. Trevelyan himself. The judges and law officers have thus the administration of laws and regulations and the ordering of prosecutions and proclamations; and are supposed to be able to decide fairly as to bringing individuals and societies within the cognizance of the law, and then, with unbiassed minds, to sit in judgment upon them. The judges who, without the intervention of a jury, relegated Mr. Davitt and Mr. Healy to six months' imprisonment last spring, were members of the Council which must have approved and ordered their prosecution.

The Lord Lieutenant and Privy Council, through the Commander of the Forces, regulate the movements of the troops in Ireland. Through an Inspector General they direct the army of 12,000 armed police. Through a "Local Government Board" of three persons they control the Poor-law guardians. Through a "Board of Public Works" of three persons they control the management of public works and public loans. Through a "Prisons Board" of two persons they control the prisons. Through a "Board of National Education" they to a considerable extent control Irish education. Through a paid "resident magistracy" they control the justices of the peace, the magistracy upon which in most other English-speaking countries is thrown the sole administration of the local laws. These justices of the peace are appointed by the Lord Chancellor, of course with the Lord Lieutenant's approval, upon the recommendation of the noblemen, Lords Lieutenants of counties. The magistracy is almost entirely Protestant. (I cannot lay my hands at present upon the Parliamentary return in which their religious professions are set forth That such returns are freely granted is an earnest that the Government does not object to light being let in on such questions.) The Lord Lieutenant and Privy Council, through "boards," control Drainage, Fisheries, Surveys, Petty Sessions Clerks, Lunatic Asylums, Dublin Hospitals, Endowed Schools, Charitable Donations, Public Records, Loan Funds, General Registry, Statistics, etc., etc., etc. You can imagine what an army of officials is necessary for such a system of control. It is officered in its higher ranks largely by army officers, by English and Scotch, mostly Protestants, and by a few Irish, shading down into a rank and file of Irish Catholics in those grades where it is to be presumed the Government does not think it necessary that great dependence need be placed. All the really important offices are held by Protestants—the Lord Lieutenant, his Private Secretary and Assistant Secretary, the Chief Secretary (who is also President of the Local Government Board), the Under Secretary, the Commander of the Forces, the Vice-President and Secretary of the Local Government Board, the Chairman and Secretary of the Board of Works, the Secretary of the Post-office, the head of the Criminal Investigation Department, the Inspector-General and Deputy Inspector-General, who command the constabulary. I think I am correct in stating that all these gentlemen are also English or Scotchmen. I do not say that Catholics and Irishmen are deliberately excluded from this army of Castle officialism which governs Ireland. So far as the magistracy is concerned, I have reason to know that in some parts of the country, at least, every effort has been made to put on every eligible Catholic. I know many Catholic magistrates who cannot have been chosen for any other reason but that they are Catholic.

It is, however, striking, and suggestive of the incubus which has hitherto weighed on the advance of Catholic Ireland, that for the most part Protestants are by Government considered best fitted for offices of trust under the state in Ireland. The tightest hand is kept over this army of officials, and the action of their relations and of their families and friends regarding public affairs is largely influenced. From the moment a man enters the Government service in Ireland he and his relatives who are seriously interested in his advancement, are bound over at least to neutrality on public affairs. An Anthony Trollope, addressing public servants in Ireland on their duties as citizens, would not be tolerated for a moment; unless in a dilettante literary way, an Irish Government employee must be careful how he speaks of Ireland. Mr. Fottrell's case was strikingly in point. A solicitor in good practice, of unimpeachable character, of warm Irish sympathies, he accepted the post of solicitor to the Land Commission mainly, it is to be believed, from a desire efficiently to work the Land Bill for the benefit of his country. He had, however, the temerity to issue from his office a pamphlet urging upon the Irish farmers to avail themselves of the benefits of the act, partly upon the ground that it was the crowning of the work initiated by Parnell and Davitt; and was thereupon compelled to abandon his situation and resume his private practice. I know of but one official who, while a loyal subject, and loyally serving the Government, holds independent opinions upon Irish politics, and he dares not declare them openly, and runs considerable risk in expressing them at all. Besides official, constabulary, and civil Government employees, there are in Dublin alone nearly 400 military officers in permanent residence and employ. The Lord Lieutenant, the Chief Secretary, the Privy Council, and these Boards of course work within powers given by acts of Parliament. They are, however, under coercion acts of one kind or another, generally in force in Ireland, practically supreme; and we all know to what extent the effect of laws depends upon their administration.

There was no malevolent design in this scheme of government. It was inspired to a considerable extent by a desire to save the Catholic majority from being trampled upon as it was of old by the Protestant minority. The Government, unable or afraid because of its dependence upon British Protestant feeling, to let the Catholics take care of themselves, has sought to manage almost everything itself. Understand that this system, as a rule, works absolutely independently of public opinion in Ireland. As a speaker put it the other day, "What would be thought of a Governor of England, or say of a Prime Minister, who could not only not be returned to Parliament by English constituents, but who would not dare to show his nose before a public meeting in the country except when guarded by soldiers or military police; . . . a Privy Council, not one of whom, from Earl Spencer down to the lowest on the list, would have a ghost of a chance in eight out of every ten Irish constituencies, even with our present limited franchise, against the humblest follower of Mr. Parnell?" However liked a man may be by the mass of the Irish people, he can find no place in that system through their confidence. However hated and unpopular, he is sustained in his position so long as he is considered a useful instrument. The good will of those who pay him is of little account to an Irish Government official. The other day I heard a Government official publicly declare in a street car that, "If we Irish were swept into the sea by England there was not another nation but would say she did right." I have before me a book entitled 'Pictures from Ireland,' by Terence McGrath, which, after appearing in an English society journal, was published in a collected form in 1880. In a series of papers on "An Irish Landlord of the Old School," "A Parish Priest," "An Agitator," "A Home Ruler," "An Orangeman," "A Successful Shopkeeper," every phase of Irish country life is reviewed in an arrogant and contemptuous spirit. All right and proper, perhaps, as holding up a magnifying mirror to our faults and shortcomings. But it was scarcely soothing to our feelings that the author should, shortly after the publication, be appointed a paid Government magistrate, to rule with almost despotic power over the very people he professed to despise. Let me now cite an instance in the opposite direction. There is no physician in Dublin more beloved by the poor than Dr. J. E. Kenny. During a smallpox epidemic he was known himself to have carried patients reeking with the disease into hospital. He was physician to one of the large Dublin Poor-law Unions. He joined the Land League agitation, and was thrown into prison "on suspicion" by Mr. Forster. This might have been necessary for the time; but it was neither wise nor just to seek permanently to injure him or any man against whom no offence had been proved. The Government, however, thought differently, and issued an order to the Union to dismiss him and appoint another physician, thereby not only depriving him of his salary, but of his ultimate right to pension. There was a great outcry, the guardians protested, but all to no purpose; he was dismissed. The feeling, however, was so strong that even the Government had upon his release to yield and permit his reinstatement. The "Castle" gained nothing but a show of its power, and the people were irritated by their impotence to sustain a man whom they loved and trusted.

Let us now inquire to what extent Irish public opinion affects the details of Irish government. A restricted constituency (without doubt soon to be enlarged upon the English model) sends to Parliament, which controls the Lord Lieutenant and Privy Council, a number of Irish members about in proportion to the population of Ireland. While these members are from their small number powerless effectively to influence Parliament, they can inquire into all branches of the administration and worry the Government with questions to any extent. As the Imperial Parliament seek to arrange everything in Ireland, to leave no buffers be-

tween itself and the daily life of the Irish people, it has to answer for everything here. We have the extraordinary spectacle of a legislature which a century ago had enough to do to look after British affairs, at present, in addition to dealing with increased social wants and increasing complications of government, besides the responsibility of ruling one-fourth of the human race in India and dependencies in other parts of the globe, taking upon itself all the humblest and minutest concerns of Ireland. When we consider how the time of such a Parliament might be employed, it is indeed pitiable to contemplate how it is often wasted on trifling details. Anglophiles proudly liken its action to that of a steam hammer, which can alike crack a nut and forge an anchor. But who would think of keeping a steam-hammer occupied cracking nuts? Take up any newspaper during the sittings of Parliament, turn to the proceedings of the House of Commons, and see how the time is wasted. I have taken up, absolutely at random, the journal for the 30th of last July. Among some score of questions relative to Irish details, which must have taken an hour or some hours to make and answer, in addition to English, Scotch, and Imperial questions, I find the following: Relative to the seizure by a sheriff's officer at Kinsale of a bed-room; the closure of a school at Mungret in County of Limerick; the promotion out of order of certain magistrates; the removal of a police hut from one part of Clare to another; the number of Lord Cloncurry's bailiffs; proceedings at a certain petty sessions meeting in Derry; dilapidation of a house in Longford; certain drainage at Scariff; why a constable was removed from one part of Ireland to another. And is it not deplorable that after weeks and months of Parliamentary business interspersed with such small considerations, questions like the Indian budget, upon which the welfare of millions may largely depend, are shuffled through in a few hours? It is perhaps worth the consideration of business men whether it might not be possible to institute some system of government by which the Imperial Parliament would be relieved of local and petty details, and under which a common flag and Empire would not be associated with pettifogging and irritating interference with parish and county government.

I must reserve some information regarding the *representative* institutions of Ireland, county, poor-law, and urban, for another letter.

Correspondence.

OTHER-WORLDLINESS.

To the Editor of The Nation:

Sir: Is not Dr. Phelps (in his 'English Style in Public Discourse,' noticed in the *Nation*, No. 962) out in ascribing to Lowell the invention of "other-worldliness"? If my memory serves me—and I think it is not here at fault—I first came across the word in Coleridge (in the 'Table Talk,' I believe, but I haven't it at hand as I write) nigh fifty years ago. Surely the inventor of a word that so felicitously fills a gap in the vocabulary of the English language ought to have the credit of the invention.

DECAY OF SPRUCE IN THE ADIRONDACKS.

To the Editor of The Nation:

Sir: Apropos of your recent article on "The Adirondack Forest," there is a danger now menacing, and even upon, the Adirondack forests much more serious than the lumbering you fear (though that has been going on in a large way for certainly thirty years past), in the gradual dying out, from some unexplained cause, of the spruce timber. In one of the large untouched tracts in Essex County, where the proportion of spruce is great to the other timber, I was unable last summer to find one tree in twenty alive, and what few there were not dead showed promise of speedy dissolution. I was told by men familiar with the county that this state of things existed, in a somewhat modified form, throughout a greater part of the Adirondack region. This dead spruce will, in the course of a year or two, become worthless, commercially, through the attacks of the worms; and if the dying out is as general as I suppose, the region will be bereft of its timber through natural causes much sooner than if a much larger rate of lumbering than the present was begun.

Brooklyn, Dec. 7, 1883.

THE LOBBY AND ITS CURE.

To the Editor of The Nation:

Sir: Your article under the above heading tempts me to return once more to the charge. The lobby is the fruit of our mode of doing business in Congress, just as much as the apple is the fruit of the tree. Just as long as the public business is cut up into fragments and tossed with an infinite mass of private bills into secret committees, which, through the collusion of the Speaker, can prevent business which they do not like from being passed at all, and all business from assuming any shape which they do not like—just as long as the public can know nothing of motives, can learn nothing of public debate, and can enforce no individual responsibility of any kind, just so long the lobby will flourish and increase in spite of all that the public or Congress can do. Congress, like a flock of sheep, must either be led or driven. If its natural leaders, the executive heads of the Government, are cut off from any access, the drover with whip and dogs must do the work from behind.

Why is what we call the lobby unknown in England? Simply because the executive ministry are responsible for the whole conduct of the Government. Any signs of corruption even in private bills would be immediately brought home to them by the Opposition. The lobby flourishes as vigorously (if not more so) about our State legislatures as about Congress, and for precisely the same reason—want of unity, of system, of organization, of responsibility. These are infallible fertilizers for the production of a rank crop of lobby mushrooms. The remedy, and the only remedy, is in giving to the executive greater control of and responsibility for legislation—which is another way of saying that the Cabinet should have seats in Congress. It is precisely the interest of the lobby and the committees which prevents the adoption of so common-sense a measure. When will a statesman appear with independence and courage enough to carry the question to the people?

Boston, December 14, 1883.

TENNYSON'S PEERAGE.

To the Editor of The Nation:

Sir: A great deal of gush and nonsense has been printed about Tennyson's peerage. It is all based upon a tacit assumption that because a man has written verses which have cheered and delighted the world, therefore the world has a proprietary interest in him, and has the right to dictate what his action shall be in matters which really concern no one but himself. If this man had devoted his life to gambling in stocks, or even to some respectable form of money-making, or if he had been a selfish pleasure-seeker, or even if he had been an average well-disposed person, going quietly about his business, doing his duty to his family and to his neighbor, all sensible people would recognize the impertinence of giving him any unsought advice as to what he should do in a personal matter such as the acceptance or rejection of a peerage. But because he has laid the world under a great burden of gratitude for having, by his writings, made it a brighter place to live in, there is an absurd pretension set up that the proper way of showing the public appreciation of his services is to harass and annoy him by criticising conduct which is not reprehensible in the forum of morals or manners, and which he may be supposed to have well considered before pursuing it.

No sane-minded man will seriously assert that Tennyson's poetry is less beautiful now than it was before he became a lord, that his numbers are less harmonious, that his thoughts are less elevated or less inspiring. Whoever finds in his acceptance of a peerage a rock of offence, impliedly confesses that his admiration of Tennyson's poems is rooted, not in their intrinsic excellence, but in the extrinsic accident of their being written by a man whom the general verdict has pronounced the greatest poet of the age.

Altogether there seems to be a singular misapprehension abroad as to the relation in which a great writer stands to his readers. The rational and natural view would seem to be that the benefit is conferred by the writer and the obligation is laid on the readers; and that the latter can only show their recognition of this state of the case in such a manner as will be agreeable to the former. One way of doing this is to be as willing to pay the writer as the printer and paper-maker and book-binder. In the case of the latter, no one asks whether they are American citizens; no one contends that if a book is printed by a foreign workman we have a right to cheat him of his wages; but there is a general impression that if the writer is not an American by birth or naturalization, we have a good title to the fruits of his labor without recompense. If the rash persons who have rushed into print with impertinent remarks about Tennyson's peerage devoted their energies to preaching the gospel of common honesty as embodied in international copyright, they would show their understanding of his ideas more practically and more conclusively. Next to paying a writer in mere money, the best way of testifying our esteem for him is the way in which we testify our esteem for everybody else—namely, by respecting his privacy and being careful not to wound his feelings or encroach upon his time. The mania for autograph-hunting has made the lives of many English and American writers a burden to them, and that other mania of ill-bred and half-grown American travellers for thrusting themselves upon foreign authors to express their incompetent appreciation is of a piece with the former. One can forgive Carlyle much of his atrabiliousness in consideration of the well-merited rebukes it led him to administer to this class of persons. And it is, no doubt, to just such ill-balanced minds that we are indebted for the offensive comments on Tennyson that fill the newspapers. By a mysterious dispensation of Providence hundreds of half-educated men who ought to be copying writs and leases, or collecting gas-bills, are permitted to edit newspapers, and every one of them seems to consider himself warranted in having a fling at a poet to whom the greatest minds acknowledge their indebtedness.

A. T.

Notes.

We have received from Charles Scribner's Sons vols. xv. and xvi. of their special edition of the 'Encyclopædia Britannica,' the contents of which we have already had occasion to report upon. By narrowing the margins and employing a less heavy paper, a somewhat smaller and much more compact volume has been obtained than that issued in the familiar red cloth, with a proportionate gain of shelf-room and of ease in handling, though, of course, with a certain sacrifice of beauty. A substantial and comely half-morocco binding still further recommends this edition.

But one part now remains to complete Messrs. Reiss and Stübel's remarkable work on Peruvian antiquities, 'The Necropolis of Ancon' (Dodd, Mead & Co.). The ninth, which has just appeared, contains one landscape, showing, in the almost pathetic technical language of the title of the plate, "the solitary grave of a simply equipped mummy"—*i. e.*, one whose friends could not afford costly cerements. The other plates delineate, in a style of chromo-lithography of matchless skill and verisimilitude, a great variety of stuffs, cotton and woollen, whose ornamental patterns furnish additional evidence of the cleverness in the art of design and exquisite color sense of the ancient Peruvians.

Cassino & Co., Boston, have published some illuminated holiday souvenirs, of which "Flowers of the Sea" is the most noteworthy—singularly delicate prints of seaweeds, which seem the actual pressed and mounted plants rather than prints. It is only the sense of touch which can readily decide. The prints are illustrated by selected poems by various authors. Not so successfully illuminated are Bryant's "Fringed Gentian," the flower employed in which seems rather the *ciliata* than the *crinita* (but it is long since we saw the latter), and the "Coming of the Birds," by Elaine Goodale. "Flowers of the Sea" ought to have a great success.

Prang & Co., Boston, send us their usual collection of Christmas and New Year's cards. The variety is enormous. The double card fringed with silk is tasteful and should be taking. Of the simpler forms we fancy most a pair of redbreasts singing a Christmas carol; while some of those of the more elaborate, which have the form of doll's fans, will be hailed with rapture by the little doll mothers who may get them.

The Forbes Co. (Boston) send us a book of samples of the Christmas and New Year's cards of Raphael Tuck & Sons, which illustrate the immensity and immense ingenuity of the Christmas-card system. They range in subject from cherubic to botanic, and some of the flower subjects surpass in delicacy and artistic feeling anything in their line we have yet seen. A miniature fire-screen which folds into a long letter-size, decorated on one side with "hips" (the rose-berry), and on the other by forget-me-not, rose, cyclamen, and yellow marguerite, is perhaps the best of the series, but the ferns of a similar card will dispute the supremacy. A series of paper boats laden with flowers is worthy of special notice, and one of bouquets inserted in cardboard (Series 964), "sunflowers, lilies, and roses," is as good color-printing as flower work need be. The figure subjects are hardly up to the mark.

We have received from Hermann Wunderlich & Co. two large etchings by Stephen Parrish, called "Evening, Gloucester, Mass.," and "Portsmouth, N. H." Mr. Parrish does good service to the public by his explorations in the province of our seaside picturesque, and his rendering of the subjects of these two etchings is a distinct consolation for the American purists who believe that an art lies in the crude exterior of our New World equal to any other. The Gloucester subject is the more fortunate of the two, but in the treatment of the water is not so happy as the Portsmouth, which also bears the New England ear-mark most deeply impressed. Both are large in treatment, but both also somewhat lack space in the distances and play in the water reflections. Does not Mr. Parrish know that the least motion in the water would render such lines as these in the reflection of the housegables in the Portsmouth subject absolutely misleading, and that such reflections as those of the black mass of the house at the right of the Gloucester are unpardonable? The perpendicular edges of reflection may be definite, but in the horizontal edges such hard-cut forms are impossible unless the water is of the most mirror-like rigidity, which the other reflections of the etching show not to be the case. Water must be as carefully studied for reflected forms as the earth for rigid ones.

The heliotype plates in the "Mountain-side" herd-book, issued by Mr. Theo. A. Havemeyer at Mahwah, N. J., are interesting not only as representing beautiful types of Jersey cattle, but as specimens of the art of reinforcing photography. Each animal's sun-portrait has been "worked over" by the artist in sympathy with her "points," and the resulting picture has been photographed anew for the process which has so many names since Albert invented it.

The double number 9–10 (vol. viii.) of the *Library Journal* is wholly given up to the papers and proceedings at the Buffalo Conference last August. These papers have all a more or less direct interest for educators, while book-buyers owe a large debt of gratitude to Mr. J. L. Whitney for his extraordinary "List of Books with Changed Titles." These changes are, of course, in large measure innocent, especially in the case of foreign works translated and published at different dates. But too many are really fraudulent, and it is not difficult to detect the publishers who have been especially culpable. The list is followed by an author and subject index. We may also call attention to the report, by the Coöperation Committee, of condensed rules for an author and title catalogue.

Ludovic Halévy's 'L'Abbé Constantin' forms No. 2 of the series of "Romans Choisis" which W. R. Jenkins is issuing from time to time at 850 Sixth Avenue.

No. 12 of the Johns Hopkins University series on Local (American) Institutions relates to "Local Government and Free Schools in South Carolina," by B. James Ramage. This concludes the first volume, and is accordingly fitted out with title-page and index. The intrinsic value of this series is very great—its example perhaps still more valuable.

A list of portraits of public characters intimately associated with the State of New Hampshire, and preserved either in the State-house at Concord, or the art gallery at Dartmouth, or at Phillips Exeter Academy, is given in the *Granite Monthly* for November. Many of these represent personages of national repute and usefulness. Mr. Josiah Emery, in the same number, continues his list of New England earthquakes from 1638 to 1883. He finds the records very meagre from 1665 to 1727.

A portrait of the African explorer Romolo Gessi, with an account of the transportation of his remains to Italy, is given in the October *Bollettino* of the Italian African Society at Naples.

Two or three years ago there was printed at a private press in Oxford a little book called the 'Garland of Rachel,' containing original poems addressed to a little girl of two by a score of the younger English poets. The contributions of Mr. Austin Dobson and of Mr. A. Lang got into the papers, and gave book-lovers a great longing to get their hands on the book, which, however, will always be unfindable, since it was printed only in sufficient number to supply each contributor with one copy. But a later work from the same press, printed with the same care and with the same initials rubricated by hand, has been issued in a limited edition of one hundred copies, ten of which were taken for America. This is 'Prometheus, the Fire-giver,' a dramatic poem by Mr. Robert Bridges; and the few copies in America are in the hands of Scribner & Welford.

'Old World Idylls' (London: C. Kegan Paul, Trench & Co.; New York: Scribner & Welford), the new English edition of Mr. Austin Dobson's collected poems, differs but little from the American edition of 'Vignettes in Rhyme,' published by Henry Holt & Co. and introduced by Mr. Stedman. 'Old World Idylls' has been so well received in England that it has gone into a second edition within a month after its appearance. Fifty large-paper copies were privately printed with the book-plate which Mr. E. A. Abbey drew for Mr. Dobson as a frontispiece. The new edition of the 'Vicar of Wakefield,' which Mr. Dobson has just prepared for the Parchment Series, will contain in its notes a mass of new matter.

A catalogue of engraved portraits has recently been issued in Paris by P. Roblin (New York: F. W. Christern). It is a price-list of the many series of etchings and engravings which may be utilized in the fascinating amusement of extra-illustrating—an amusement which is no longer wicked when the extra plates are not the spoil of rifled books.

Those who think that the drama is the department of literature in which the French most excel, and who have been in the habit of reading the best plays of the leading contemporary dramatists, have long regretted that M. Victorien Sardou no longer published his lively dramas. They will therefore be glad to learn that he has resumed the publication of his plays. "Divorçons" has just appeared (Paris: Calmann Lévy; New York: F. W. Christern), and "Dora," "Pédora," "Odette," and "Ferréol," are promised shortly.

It has been an exposition year. To say nothing of the one at Atlanta, and the two at Boston, there is the great Colonial Exhibition at Amsterdam, a Retrospective Exposition at Malines, another at Ypres, another earlier in the year somewhere in France, an Architectural Exhibition at Brussels, the Fisheries Exhibition at London, the two electrical expositions at London and Vienna, and the Exposition des Arts Incohérents in Paris. Another, of a little different nature—the show of books, engravings, and manuscripts of and about Luther in the Grenville Library at the British Museum—has been the occasion of a lively controversy in the *Athenæum* between Mr. Karl Pearson (who asserted, in language which seems to us unnecessarily insulting, that the Museum had overlooked, through haste or ignorance, many important Luther documents, and had moreover made very serious blunders in the catalogue) and Messrs Henry Stevens and Henry Jenner, who defended the Museum in a fine sarcastic tone, and with arguments not always convincing.

The council of the Royal Society, London, has announced its award of the Society's medals for the present year as follows: The Copley Medal to Professor Sir William Thomson, for (1) his discovery of the law of the universal dissipation of energy; (2) his researches and eminent ser-

vices in physics, both experimental and mathematical, especially in the theory of electricity and thermodynamics; a Royal Medal to Professor T. A. Hirst, for his researches in pure mathematics; a Royal Medal to Professor J. S. Burdon-Sanderson, for his eminent services to physiology and pathology, especially for his investigation of the relations of micro-organisms to disease, and for his researches on the electric phenomena of plants; the Davy Medal to Doctor Marcellin Berthelot and Professor Julius Thomsen, for their researches in thermo-chemistry.

The meteorological observatory on the summit of the Ben Nevis was formally opened on October 17, and the station has since been provisioned with stores sufficient for a period of six months, nothing having been left undone which would secure the greatest possible comfort for the observers who are to occupy the station during the coming winter. Telegraphic communication with the outer world is now always possible by means of the cable running from the observatory to Fort William. The superintendent, Mr. Omond, and his two assistants took up their residence on the top of the Ben early in November last. At a meeting of the directors of the establishment, held in Edinburgh lately, Professor Sir William Thomson in the chair, the treasurer reported that the subscriptions now promised for its support amounted to about $25,000. The scheme of work adopted for the approaching winter is very elaborate, and the observations are to be made hourly, by night as well as by day.

There is talk abroad of transporting the Paris Observatory to some distance from that city, to a site in the vicinity of the new Flammarion Observatory. The present location is recognized as objectionable in some respects, but the advisability of removing to a new site seems doubtful, unless the advantages to be derived are very great. The Observatory has lately signalized itself by setting up a novel form of equatorially-mounted telescope, in which the principal tube is bent at right angles, and the rays of light from any star are brought, after reflection from two plane mirrors, to an eye-piece maintaining a constant position. The observer thus may be seated in a room adjoining his instrument, entirely shielded from all inclemencies of weather, while the instrument itself is, in large part, uncovered in the outer air. The new telescope is not surpassed in its optical qualities by any instrument of the Observatory, and it requires no expensive and cumbrous dome to cover it, as in the ordinary form of mounting. This ingenious construction is the device of M. Loewy, the sub-director of the Observatory, and its completion is due to the munificence of M. Bischoffsheim, a wealthy Paris banker and well-known patron of French astronomy.

—A few juvenile books remaining unnoticed must be briefly dismissed. 'Two Little Waifs,' by Mrs. Molesworth (Macmillan), is a very pretty and touching story of two children, apparently forsaken by their friends for a time, and left in a foreign country among strangers. Their ignorance of the language makes their difficulties peculiarly disheartening. The story seems a little hurried at the end. Where so much detail of trouble is given, a happy finale is apt to lack reality unless told at some length; and here the meeting at last of the children with their father is told in too few words. But perhaps nothing is more often shirked than the trouble necessary to make a wholly satisfactory close either to story or novel. In 'The Tinkham Brothers' Tide-Mill' (Lee & Shepard), Mr. J. T. Trowbridge has told of the indomitable pluck with which three young men defended their rights and conquered their difficulties. The "Tinkham Brothers" seem, indeed, some years older and wiser than people are apt to be in their teens, but we lose sight of this in the interest of a very graphic story. It illustrates the self-assertive tendencies of Young America that while the mother is supposed to be a most delightful friend and companion to her children, she for the most part follows their lead and supports their plans, instead of taking the place of guide and guardian which would seem natural to her years. Two new volumes of the "Young Folks' History" (Estes & Lauriat) are Part 2 of the abridgement of Mrs. Strickland's 'Queens of England,' by Rosalie Kaufman, and 'The Civil War,' by Mrs. C. E. Cheney. The first part of the 'Queens of England' we noticed with high commendation at the time of its appearance, and need not speak in detail of the present volume. It affords very interesting and useful reading for the young. We suppose that the editor's theory of the responsibility of the maker of an abridgement does not extend to corrections of matters of opinion. We are sorry to see on p. 162 so misleading a statement as that King Charles I. "ascertained that five members of the House of Commons were traitors"—"Pym and his confederates." The 'History of the Civil War' is also a book that can be heartily recommended. It improves as the author warms up to her subject. The first few pages strike one as being rather stiff and artificial in style, and altogether there is too great tendency toward digression and "moralizing." The story, however, is exceedingly well told, and in a spirit of keen sympathy with the objects and results of the war, if at times a little intolerant in tone. We can afford now to do justice to the aims and motives of the losers in the great contest. The illustrations are not so good as the book deserves. We find a queer and unnecessary blunder on p. 151—that "*carnifex* [Carnifex Ferry] is a Latin word which means 'villanous.'" A knowledgeful book, in perusing which the elder folk also will find themselves pleasurably refreshing their early tuition, is 'Young Folks' Whys and Wherefores: A Story by Uncle Lawrence' (Philadelphia: Lippincott). It is partly founded on a French juvenile, which has also furnished many of the illustrations. The American cuts, well enough by themselves, have here, beside the soft delicacy and artistic touch of the French, a crudeness so palpable that the book is pictorially much the worse for them. The little book is a very readable one, and many a child will be unable to lay it down before Captain Merton has arrived from his long and stormy voyage. The successive chapters are not, however, fitted together with any extraordinary tact, and the selection of topics introduced might easily have been wiser. Those about which little Annie is profuse with interrogatories are, in general, capitally treated, and more to the point, with an almost unvarying accuracy. Some parts of the book appear to have lost their originality and pointedness in the translation, and doubtless the little folk who can will do much better to read it in the original. Uncle Lawrence need have no fear lest his young friends may not find both instruction and amusement in its pages, and he will pretty surely be called upon for a second print of his little story, in which he ought to correct some of the numerical data he has employed, and which are among the by-gones.

— The interesting little book entitled with great propriety 'A Little Girl among the Old Masters, with introduction and comment by W. D. Howells' (Boston: Osgood) is rather a psychological than an art study. It is a curious pictorial record of the impressions of the Italian mediæval painters on a girl of ten, who has had no training in drawing and no art surroundings in her earlier years. It is not an uncommon thing for children to show this precocious facility for drawing even in America, and it is not, as fond parents are always inclined to suppose, any indication of promise in the higher development of artistic capacity. It is often merely imitative; oftener simply naturalistic—in American children almost universally so; and the naturalistic tendency, so far from indicating the embryonic state of artistic individuality, is a counter indication. A strong scientific bent in a child almost invariably involves a fondness for drawing of natural objects, and this is the outcome of faculties and feelings diametrically opposed to the purely artistic. A child who had passed her life in the world of art, always under the influence of works of the ideal type, such as are those of the mediæval painters of Italy, might be expected to show art tendencies in the direction of their teachings; and it is a law, illustrated by the homologies in science, that the general evolution follows the same process as the individual: the art expression of an artist child, growing freely to maturity, will follow the same development and phases as those which art followed in its growth. The early efforts of any child of true art nature will resemble, in the way they approach and follow the ideal, the approaches and accomplishments of the early art epochs. The curious phenomenon of an American child of ten catching so completely the spirit of early Italian art as has the designer of these naïve and childlike drawings, does not fall under the general law which regulates the development of an art epoch—it is a sporadic case of a tendency absolutely alien to her life and surroundings which is well worth study as a case of reversion or anticipation, as the case may be, of the art life. The drawings are, so far as the technique is concerned, really childish; but the reflection of the inspiration of the religious masters is so true that at first blush one is almost ready to hail a real genius in its early stages. The motives of the composition and rhythm of the early Italians are reflected in a most unmistakable way, and some of the drawings are true compositions, which an accomplished painter might be glad to have invented; and the symbolism and attribution are as bold and original as those of many of the great early painters, with whose vein this child's accords far more truly than with that of the Venetian and later painters. No. 13, the child Christ presenting the scales to St. Michael, is a complete and delightful picture motive; No. 17, the Madonna of the Orphans, but little inferior, and charming in the three little orphans who shelter in the Madonna's robes. No 22, a naïve arrangement of a triptych, is a good decorative theme, and now and then a delicious bit of action comes into a composition, as the angel playing on a lute in No. 3. It might be a great mistake to suppose that a possible mature art lay behind this precocity—the great probability is the reverse; but the book is none the less an item of æsthetical science peculiarly worth notice.

—We ought sooner to have called attention to the second volume of Dr. Willshire's Catalogue of the early prints of the German and Flemish schools in the British Museum. As the first volume was devoted to wood or metal cuts "en taille d'épargne," so this contains what are generally understood as "prints"—impressions from incised plates, "en taille douce." The exceeding richness of the Museum collections in the incunabula of the art renders this intelligent and detailed description of the work produced by the masters of Germany and the Low Countries up to the time of Israel van Meckenen a necessary

addition to the volumes of Bartsch and Passavant in the libraries of all lovers of that wonderful Flemish school which found its perfected development in Goltzius and Bolswert, Rembrandt and Houbraken. In his introduction, Dr. Willshire follows Passavant in vindicating for the Northern School, in the person of the master of 1446, the earliest known example of intaglio work, in opposition to the formerly received tradition which ascribes the invention of engraving to Maso Finiguerra, Baccio Baldini, and the Italian niellists; and he gives a facsimile of the very interesting print bearing this early date. A good condensation of the evidence as to previous niello work in Germany will also be found on pp 12-14. This volume is a further illustration of the liberal spirit which seeks to render the treasures of the Museum print-room accessible and available to students. No one who has experienced the courtesy of the late keeper, Mr. Reid, can help contrasting it with the narrow jealousy which guards the riches of some other public deposits. For the sake of art, it is to be hoped that the new keeper, Professor Colvin, will be equally true to the traditions of his office.

—The opening of the new library building at the University of Michigan on the 12th of December was an event of more than local interest. The friends of the large number of students at that university will be glad to learn that the rooms in the law building, which for twenty years have afforded shelter and meagre accommodations for the general library, have at length been surrendered to the exclusive use of that department of the institution for which the building was originally designed. A little more than two years ago the Legislature appropriated $100,000 for a new and incombustible library building. The needs of the University were somewhat peculiar, inasmuch as the number of students using the library is very large in proportion to the number of volumes in the collection. It has thus far been deemed impracticable to allow the books to be taken away from the building, and consequently a large reading-room was indispensable. Mr. Van Brunt, of Boston, who had the advantage of experience in remodelling the Harvard library building, was employed as the architect, and the result is probably in many respects the most interesting university library building in the country. The predominant feature of it is the semicircular reading-room. This room is admirably lighted by a continuous row of twenty-two windows near the ceiling. The reading-desks are ranged in semicircular lines and afford accommodations for 212 readers. The reading-room is separated from the book-room by the main corridor and the delivery desk, while on either side are the rooms for cataloguing and administration. The book-room is constructed on what is known as the Harvard plan, and, besides ample provisions for enlargement, affords present accommodations for 108,000 volumes. In the second story are fitted up four rooms for the use of professors and students pursuing special branches of study. These connect directly with the upper story of the book-room, and thus the books likely to be most needed by specialists are made easily accessible. In two of the rooms will be carried on the work of the Seminaries of English Literature and Classical Philology, while the other two are devoted especially to the uses of the School of Political Science. The Shakspere Library, consisting of 2,500 volumes, recently presented by Mr. McMillan, is shelved in one of the rooms, and the new acquisitions on the subject of history and political science, of somewhat more than 2,000 volumes, are accessible in two of the others. In the story above the reading-room, the special students' rooms, and the book-room, is the Gallery of Fine Arts, where is already to be seen a very interesting collection of marbles, bronzes, and casts, as well as of engravings and photographs.

—Those portions of the exercises at the opening of the library of most interest to the public at large were the historical sketch of the library by the librarian, Mr. Davis, and the more formal address by Mr. Winsor, the librarian of Harvard. The librarian reports that the number of volumes in the library has more than doubled within the last ten years. The unusual extent to which the books are used is indicated by the simple statement that the recorded number of volumes drawn during the past year reached 95,000. This number is estimated to be only about sixty per cent. of the total use of the books, inasmuch as the work of special students is carried on in the alcoves where no record of the books used is made. Within the past year Mr. James McMillan, of Detroit, gave to the University $6,500, for the purchase of a Shaksperian collection; and a gentleman who declines to allow his name to be made known has put $4,000 into the hands of Professor Adams for the purchase of books on history and political science. The books so provided, when taken in connection with the previous accumulations of the library, afford unusual facilities for students of English and of the various branches of history and political science. The Rau Library already furnished a nucleus of 4,000 volumes and 6,000 pamphlets on political economy, finance, and administrative law. Mr. Winsor's address was a plea in behalf of the preservation and the collection of books. The policy of discrimination, he said, has now been rejected by all the great libraries of the world, for the reason that what is the trash of one generation becomes the highly prized treasure of another. The British Museum and the other great libraries now reject nothing. But this policy has not long been pursued, and hence it is that no single library in the world is perfect enough to satisfy any considerable number of different specialists. John Quincy Adams thought it a matter of reproach that there was no library in America in which the foot-notes of Gibbon could be verified. Mr. Winsor doubted if there was a library in America to-day in which it could be done. Of the books that have been published since the invention of printing, not more than one-half of one per cent. are in the United States. And yet within the past twenty-five years we have set seriously to work to amass collections of books, and within the last few months the speaker had known a Spanish scholar, who had exhausted the libraries of the cities of Europe, obliged to cross the ocean to find prizes that had been brought hither from the Old World.

—The October number of the *Antiquary* contains "a description of England sent to Phillip II. of Spain" in 1686, communicated by J. Theodore Bent. As "it is presumable that is was one of the principal incentives to that monarch for undertaking his expedition," it must be regarded as a very important document. It begins with a list of the counties in geographical order, and of the noblemen of the country (earls and barons), also one of the leading ports; after these, follows an account of the military and naval force, and of the income and expenditure of the kingdom. The ports which are defended by forts or castles receive special marks, and the Catholic counties and noblemen are also indicated. Here are interesting details of information. Of twenty-three earls, seven are marked as Catholic; of twenty-six barons, the same number: Admiral Howard—we suppose Lord Howard of Effingham, whom historians call a Catholic—is not mentioned as such. The classification of the counties is especially interesting. The seven northernmost counties, and most of those on the Welsh border, with more than half of those south of the Thames, are classed as "in the hands of men for the most part Catholic." On the other hand, the entire centre and the east coast (south of Yorkshire) is Protestant, with the exception of Oxford, Rutland, and Suffolk. It was here, it will be remembered, that lay the strength of the Parliamentary party in the civil war of the following century. In the same number Mr. Stanley Lane Poole writes of Mohammedan coins. Calling attention to the prophet's prohibition to make representations of living beings, he speaks of the beautiful arabesques which adorn many of these coins, and of the abundant genealogical and historical information which is stamped on them in the place of faces and figures. Apart from this information, they possess little interest, and the writer ends with saying: "I write after finishing the eighth volume of my Catalogue of Oriental Coins in the British Museum, which has been going on for the last ten years, and I have no hesitation in saying that Oriental numismatics is a science which is interesting mainly in its results."

—The recent production of the "Birds" of Aristophanes at Cambridge, England, writes an English correspondent, was regarded by the Committee as rather a hazardous undertaking, for although Greek tragedy has now abundantly proved its power over modern audiences, it was thought very doubtful if the old comedy was equally suitable for revival. And, notwithstanding the brilliant success of the performances, this doubt has been in great part justified, for most of the fun and fooling in the play resembled a modern pantomime too closely to be very interesting or impressive, while when the satire was not of a modern kind its point was entirely missed, except by the learned few. There was no idea dominating the whole play and leaving its impress upon the spectators; on the contrary, its interest consisted of variety of incident, and its success was owing to the admirable manner in which the incidents were acted. The leading parts were all acted with remarkable power and ease: *Peithetairos* spoke his eight hundred lines as readily as if Greek were the only language he knew, without an instant's pause or cessation of vivacity, and *Euelpides* kept the audience in constant laughter by his comic appearance and his ridiculous "business." The intelligence with which every actor contrived to render his own part an essential feature in the fun of the play was the most striking feature of the performance. *Euelpides*, for instance, when he was on the stage at one time without speaking, essayed his new wings in a series of extremely ridiculous attempts at flight from the top of the altar, each ending, of course, in disastrous collapse; when *Peithetairos* came to the words "ἐπισείξω τὸν ἀλεκτρυόν," the Cock brought down the house by strutting out from the chorus group and giving a most lifelike crow; when the Priest, in sacrificing, scattered barley upon the stage, the Birds all ran forward and began to pick it up. The Birds were constantly engaged in some comical tricks, one of them going so far as to peck the long hair of the violoncellist in the orchestra, to the great amusement of the audience and the embarrassment of that worthy man. *Herakles* drank off the contents of the saucepan in which *Peithetairos* was cooking, when the latter's back was turned; and *Prometheus*, hiding from *Zeus* under the sunshade, introduced as much comic "business" as an actor in a screaming farce. These things, and the brilliance of the spectacle, and the delightful music of Dr. Hubert

Parry, secured the present success, but it is improbable that another comedy will be produced in the series of classical revivals which bid fair to become a regular institution at Cambridge.

—The costumes of the Birds were probably less conventional and more picturesque than those actually employed by Aristophanes, and their ornithological accuracy was secured as nearly as possible by Professor Newton. Their dress consisted of a bird's head with an appropriate beak, covering the head of the actor except an oval opening for his face, and wings reaching from the shoulders to the knees and enveloping the arms, by which they were moved from within. Some of the birds had long necks extending several feet above the heads of the actors; these were swans, a spoon-bill, and a gorgeous flamingo. The bright colors and picturesque attitudes of this chorus made the "Birds" a far more brilliant spectacle than either the "Œdipus" or the "Ajax." The final scene was especially striking. On each side of the stage the Birds were grouped like infantry prepared to receive cavalry, the front rank crouching close to the ground, wrapped in their wings, the next row standing with their wings stretched out from the shoulders, and those behind extending their wings into the air; in the centre *Peithetairos* and *Basileia*, seated, in white wedding garments, with *Euelpides*, *Prometheus*, *Herakles*, *Poseidon*, and *Triballos* around them, and the hoopoe at the back spreading his broad yellow wings above them all. As before, Dr. Charles Waldstein, who has just been appointed the Director of the Fitzwilliam Museum, at Cambridge, had charge of the stage management and the archæology of the undertaking.

—The veteran archæologist, Mr. F. C. Penrose, is now in Athens on a mission from the Dilettanti Society to excavate the site of the temple of Olympian Zeus, and to set at rest, so far as existing remains may admit, the long-vexed question of the interior disposition of this temple. The Ἀρχαιολογικὴ Ἐφημερίς of November 2-14 publishes an account of the results attained during the first few days of work. The plan appears to differ essentially from that of any other classic temple known, in that a foundation wall, dividing it longitudinally in the middle, has been laid bare to the length of 114 feet. There is evidence that this wall supported a row of columns immediately beneath the ridge of the roof. If this theory is confirmed by further investigation, Mr. Fergusson's restoration of the temple with a vaulted ceiling in connection with his ingenious, if a little hasty, conclusions as to the lighting of Greek temples, will have been upset. The foundation wall alluded to is apparently older than the other remains of the temple—perhaps as old as the building of Peisistratos—and extends to very near the present surface of the ground. Fragments of the main walls of the temple, a pavement of unhewn blocks, and other vestiges have been discovered at a depth of eight feet below the surface. The conclusion of Mr. Penrose's labors will be awaited with interest, especially as permission has been withheld by the Greek Government for many years.

—M. Bertrand, in the *Revue des Deux Mondes*, comes out from the region of pure mathematics and gives a warmly appreciative account of a man of remarkable inventive genius—M. Marcel Deprez. Like many men of great originality, Deprez, when a pupil in the School of Mines, failed to give satisfaction to his teachers, and there was question of inviting him to discontinue his studies. The young scholar offered an excuse: accustomed to follow out his own ideas, when the beginning of a lecture suggested a problem he ceased to listen, and endeavored to solve it. His qualities attracted the attention of M. Charles Coombes, an eminent engineer and member of the Académie des Sciences, who took him into his service and directed studies for which, now that he followed them at his own inclination, he showed great zeal. Deprez's first work was in connection with the steam-engine; he made important improvements in the slide-valve, the indicator, and the governor. In the course of his experiments on new methods for measuring the explosive force of powder, he found himself obliged to invent a chronograph. That already in use caused a spark from an interrupted current to record itself on the paper, but the spark was erratic and the record far from accurate. The method by which an interrupted current produces a magnet which moves an indicator, had been tried without success by Wheatstone and Regnault. The movements were too slow. M. Deprez produced a magnet capable of causing a motion of 50,000 metres a second, and the difficulty was removed. It is a maxim of his that in instruments of measure, the mass to be moved should be insignificant compared with the force which moves it; in his galvanometer the needle is replaced by a piece of iron, called from its shape a fishbone, between the arms of a powerful magnet, and measurements are taken by it in a few seconds, which formerly required as many minutes. M. Bertrand quotes a saying of Watt's, "There is no greater folly in life than to make inventions," which reminds one, by the way, of the dictum attributed to M. Bertrand himself, that all mathematics beyond Euclid is "une excroissance maladive de l'esprit humain." M. Deprez was now thoroughly smitten with the folly of making inventions. Still a young man, his reputation was already such that learned commissions showed unlimited confidence in his projects, and literally gave him orders for inventions.

—No man of science has ever been more ready to talk about his projects to whoever would take an interest in them or less eager to claim the honor of an invention when his ideas have been prematurely appropriated by others. When Le Verrier wished to explore a certain part of the heavens, he gave his subordinates a chart and said, "If there appears the slightest discrepancy between this chart and the sky, press this button: I shall come at once and I will take charge of the rest." When a discovery followed, the observers complained bitterly that they had been defrauded of the honor of making it. M. Marcel Deprez, in such a case, would have shrugged his shoulders and gone on observing. When his machines work well he considers himself rewarded for his pains. The number of his inventions is very great. He has a device for diminishing the personal equation, for measuring the velocity of a bullet, for comparing the intensity of two currents, for measuring directly the energy of a current. He has an electric motor, a machine for solving equations, for integrating, for calculating logarithms. But his greatest distinction has been obtained from his machines for the transmission and distribution of force. A fine conducting wire offers so much resistance that a strong current is immensely enfeebled; a wire sufficiently thick is of enormous cost. M. Deprez has solved the difficulty by making as fine as possible the wire in which the current is produced, thus being able to increase greatly its length. A wire in the generator fifty times longer means an electromotive force fifty times as great. At the Munich exposition of 1882, force (only half a horse-power) was transmitted a distance of fifty-seven kilometres. The commission announced the success of the experiment to the Académie des Sciences by a telegraphic despatch. Two months ago, at Grenoble, seven horse-powers were transmitted a distance of fourteen kilometres with a loss of only 40 per cent. of the power used. At the Paris Exposition of 1881, M. Deprez received the grand diploma of honor for his method of distributing an electric current. In the experiments actually made the receiving machines have been supplied each by a separate wire. M. Deprez has a plan, as yet only on paper, in which the current is made to pass on a single wire to one machine after another. When some of the machines are cut off, the current is enfeebled in the former case, and strengthened in the latter; in both, M. Deprez regulates the generator by means of a current borrowed from the machine itself.

—In François Lenormant, whose death was announced a few days ago, France has lost one of her representative scholars. He died young—before completing his forty-seventh year—but left in productions of his own a little library on archæological subjects, mainly Oriental. His father, Charles Lenormant, having travelled in Italy, Egypt, and Greece, earned distinction by writings on numismatics, ceramic remains, Oriental history, and Egyptian antiquities. François, endowed with a precocious genius and an insatiable desire for learning, followed closely in his footsteps. Before the age of twenty he obtained the prize of numismatics from the Academy of Inscriptions and Belles-Lettres. He wrote on the coins of the Lagidæ, the Sinaitic inscriptions, the Anastasi collection of Egyptian antiquities, and kindred subjects. He made scientific tours in Germany, Italy, Greece, and Syria. For a time he was attracted by diplomatic questions of the day, and wrote on the Ionian Islands in their relations to Greece, on the Syrian massacres, and even on Turks and Montenegrins; but after a few years of mixed endeavors he devoted himself to the exclusive study of antiquities. His monographs and compilations became exceedingly frequent. Not a year passed without his appearing before the public with one or more learned publications on the history, religion, science, and art, or the languages of the ancient world, chiefly as revealed by the deciphering of the cuneiform inscriptions and the critical studies based on them. He was to France a kind of periodical reporter on all these topics of archæological inquiry, his summaries in varying forms being pleasantly written, comprehensive, lucid, and fresh, and flavored with striking comparisons and conjectures. His works were also diligently read by foreign scholars, and references to them are very frequently met with in the notes of the best German Assyriologists, though he never became an authority even in the fields best cultivated by him. His 'Manual of the Ancient History of the East' (written jointly with E. Chevallier, and often revised and republished), his 'Chaldæan Magic,' and 'Beginnings of History' have been translated into English. Among his Assyriological writings are 'Letters assyriologiques'—including his 'Études accadiennes'—'La Langue primitive de le Chaldée et les idiomes touraniens,' and 'Les Syllabaires cunéiformes.' He was a diligent contributor to French, German, English, and Italian learned periodicals, and displayed an almost feverish activity to the last days of his life. In 1870-71 he served as a volunteer in the defence of Paris, and at the battle of Buzenval was wounded Since 1874 he had been Professor of Archæology at the National Library of Paris.

—Robert von Hornstein has contributed some interesting reminiscences of Schopenhauer to the *Neue Freie Presse*. They are based partly on a good memory, partly on letters and jottings in

his diary. Hornstein's attention was first directed to Schopenhauer through Richard Wagner, whom he met in Switzerland when he was at work on "Rheingold," and who always spoke of Schopenhauer in the most admiring terms. Hornstein, having arrived in Frankfort, lost no time in hunting up the hotel "Englischer Hof," where Schopenhauer daily attended the table d'hôte. He saw the philosopher in conversation with the young artist Luntenschütz, who had just finished his portrait; and he was surprised at his youthful movements, his animated conversation, and frequent hearty laughter. The next day he resolved to call on him, and had an interesting conversation on Spanish, which Schopenhauer was learning in his old age; on travelling, which he insisted should be done by young people only; and on music. When he left, Schopenhauer remarked: "That I received you is due to my housekeeper, who said you were a student. If you had been a professor of philosophy I would not have received you. Professor Weisse of Leipzig one day called on me. But I answered in so loud a tone that he must have heard it: 'To Professor Weisse I am not at home.'" Some time after this, Hornstein was sitting at Schopenhauer's table in the hotel one evening when a man introduced himself to Schopenhauer as Professor Warnkönig, a friend of Fichte's (the younger). Schopenhauer's hearing being defective, he understood him to say, "I am Fichte," whereupon he exclaimed, "Fichte is no friend of mine," and rushed away. Hornstein followed him and explained the matter, whereupon Schopenhauer returned, apologized, and became very amiable toward the professor. On another occasion an American asked him what he thought of Hegel. "A charlatan," was his curt reply. He had no high opinion of Americans. "I hate Americans," he said. "Their behavior is rude, their intelligence borrowed from the East. They have plenty of money to build cities, but not wit enough to give them names, so that in America all the names of European cities are to be met with. The Englishman is related to an American as a ducat to a counter. At first sight they are indistinguishable, but ever after——. The English are a noble nation, intelligent in the highest degree, so that one can forget their ecclesiastical superstition. The Americans, on the contrary, are Jewish orthodox without the English virtues." Publishers were another class of people he did not admire. One evening, when Baron Cotta was pointed out to him, he said, "I don't like publishers, least of all those who are barons." Schopenhauer denied the authenticity of two of the anecdotes current about him—the first being that he placed a gold piece before his plate every day, with the intention of giving it to some charity the first time his neighbors would refrain from talking about women, dogs, and horses; the second, that, some one having called attention to the fact that he ate as much as two, he replied that he also thought as much as two. Hornstein thinks that notwithstanding his strong likes and dislikes, he did not, in personal intercourse, give the same impression of savageness as in his letters and diaries published by Frauenstädt, Gwinner, and others. Like a naughty child, he sometimes in his writings got so excited that he must have astonished himself on reviewing them. After his genius began to be recognized he became more quiet. To Jean Paul he was grateful all his life for having said a few words in his behalf. But his special pet was Goethe, whom he defended with the jealousy of a lover. Schiller he regarded as Goethe's rival, and was therefore, by his own confession, tempted to underrate him. Byron he considered the second greatest o English poets, and could never forgive himself for having made no use in Venice of a letter of introduction which he had from Goethe. "Do you know," he once said, "that in one year the three greatest pessimists were in Italy at the same time? Doss figured it out: Byron, Leopardi, and I. And yet none of them got acquainted." In regard to his personal habits, Hornstein tells that he smoked one cigar and one pipe every day, and used a little snuff. One day he was very indignant when he saw a laborer smoking while at work. His own idea was that tobacco should be used only at leisure, to keep the head clear and get as much as possible out of one's brain. His wish that he might live ninety years was not gratified, but the mode of his death was as sudden and unexpected as he had desired. He was pouring out his coffee one morning, and a few minutes later was found dead. In his will he had specially requested that the burial be delayed longer than usual, as he dreaded being buried alive.

—Schopenhauer's views on music and musicians have not contributed to his reputation, and are generally looked upon as a huge joke. Rossini was his favorite. He had all his operas arranged for the flute, and played them through once a year. "I admire and love Mozart," he said, "and attend all concerts at which Beethoven's symphonies are played. But when one has heard Rossini, everything else appears heavy." And yet he avoided making Rossini's acquaintance when he stopped for a few days at the "Englische Hof." "That cannot possibly be Rossini," he said to the host; "that is a fat Frenchman." Schubert he did not appreciate, and criticised the incorrect conception of the "Erlking"! Mendelssohn's compositions he considered pretty, but devoid of genius, and his symphonies tedious. Gluck he always found tedious, and criticised his music because it could not be conceived apart from the words. Music is mightier than words. To unite them is to unite a prince with a beggar maiden. Concerning Wagner he said to Hornstein: "He sent me his trilogy. The man is a poet, not a musician." Wagner's practical view of music, it need hardly be said, differed in toto from Schopenhauer's. He only adopted the metaphysical view which assigns to music the highest place among the arts, because it is a direct expression of the will, which underlies all phenomena, while the other arts are concerned with these phenomena alone.

—Three compositions made up the programme of the second Philharmonic concert—Goetz's symphony in F ("Nänia"), Beethoven's Fourth piano concerto, and Schumann's Fourth symphony. To the eye this short list looks formidable, but to the ear it was anything but tiresome. Goetz's symphony was probably a novelty to a large portion of the audience. It contains several pregnant themes that are developed with uncommon ingenuity and an easy command of musical form, while the instrumentation is quite on a level with the spirit of the time. One can never hear this symphony, or Bizet's Suite Arlésienne at a concert without regretting that both these composers should have died so young, at 36 and 37 respectively. They were the most gifted among the younger opera composers, Goetz's "Taming of the Shrew" being one of the most popular operas in Vienna and Berlin, where it is charmingly interpreted by Lucca and Lili Lehmann. The performance of Schumann's Fourth symphony was quite as full of life and feeling and as perfect in rhythmic shading as that of the First in Brooklyn, week before last, which seemed to mark the highest possibilities of orchestral execution. All the poetic charm of the romanza was brought out, and the way in which the short presto at the end of the last movement was played was exciting in the highest degree. It is worthy of remark that there are not a few people in our best musical circles who frankly admit that they would rather hear a Schumann than a Beethoven symphony. Some of these are Wagnerites, and they hold this opinion in spite of the anathemas hurled at Schumann's symphonies by one of the Bayreuth satellites. Prof. Baermann's performance of the Beethoven concerto differed in no essential respect from that a fortnight ago in Brooklyn, and deserves all the praise we then bestowed upon it. He conquered the affections of the audience *prima vista*, so to speak, and it is evident that Mr. Joseffy will have to look to his laurels.

KUENEN'S HIBBERT LECTURES.

National Religions and Universal Religions. By A. Kuenen, LL.D., D.D., Professor of Theology at Leiden. [The Hibbert Lectures, 1882.] New York: Charles Scribner's Sons.

KUENEN'S great fame as a Biblical critic and historian of religion rests on comprehensive works unreprinted in this country, and not all of them translated into English. The Hibbert lectures of 1882 for the first time introduced the powerful dialectician and scholar to the English-speaking public at large. The most important results of his critical examinations in the field of Old Testament studies, by which he has become the head of the modern Dutch school of Biblico-historical learning, are here presented in an epitome charming alike for its clearness, conciseness, strength of reasoning, and cogency of expression. The notes appended give an indication, at least, of the extent and freshness of the author's learning. Of the five lectures before us, the first and last are mainly devoted to Islam and Buddhism respectively, but the author himself designates these fields as "ground which he dare not exactly call his own," and from which he "hastens to return to his own household gods." The connection between Christianity and Israelitism is his main subject, though the guiding thread of the systematic disquisition is "the connection between the universal and the national religions as furnishing the explanation and the measure of their universalism." We will here follow him only through the domain in which he is a master.

The questions are propounded: Was the worship of Jehova amongst the pre-exilian Israelites national? If so, in what sense? Was there more than one Jehovism? If so, in what relation did the one stand to the other? The problem is singularly complex. "The hypothesis of the introduction of Yahwism from without must be definitely abandoned." The philosopher Comte, by an arbitrary assumption, derived it from Egypt, but not a single student of the Israelitish religion has adopted his view. Renouf ridicules all pretended discoveries of Egyptian influences in Hebrew institutions. "From the earliest period down to the Babylonian captivity, Israel had its own national religion, which we can only call Yahwism." The sanctuaries of Shiloh, Jerusalem, Dan, and Bethel, and also the *bāmōth* (high places) all over the country—probably of Canaanitish origin—were sacred to Jehovah. The sacrifices at the altars of Bethel or Zion, or at the numberless *bāmōth*, which Amos, Hosea, and Isaiah denounced as hateful to Jehovah, were offered to him and to no other god. This worship was closely interwoven with the ordinary life of the Hebrew. His feast-days were holy days. His Sabbaths, new moons, harvest rejoicings, sheep-shearing feasts, and family gatherings were consecrated by religious

solemnities and offerings. And the people thought Jehovah to be in their midst, relied upon his help, deemed his sanctuary their safeguard, and repaired to it for oracles. The mark of Jehovah was stamped upon many Hebrews in their very names, compounded with his. From Jehoshaphat downward almost all the kings of Judah bore names thus formed. The Old Testament is full of evidences of this devout disposition of the ancient Hebrews toward Jehovah.

And yet the current conception of the religious condition of ancient Israel is widely different. This erroneous conception is derived, not from special traits, with which the most trustworthy pages of Israelitish history abound, but "from the general reviews of the popular religion which the Israelitish historians lay before us — the introduction of the book of Judges and the retrospect of the fates of the kingdom of the ten tribes." According to these authorities, the generation that had conquered Canaan under Joshua remained faithful to Jehovah. Then began the apostasy. Israel forsook Jehovah and served the Baals. Chastisements and deliverance brought the people back to the God of their fathers, but only for a time; on the death of each divine deliverer the people relapsed into idolatry. In the kingdom of the ten tribes things were constantly most deplorable. There was no faith in Jehovah; and strange gods, such as Baal and Moloch, received an abominable worship. The warnings of the prophets were not heeded, all the commandments of Jehovah were scorned. And in Judah things were generally no better. In Chronicles this picture is darker still. The prophets themselves speak of the religious condition in both kingdoms in the harshest terms, but while they declare that the people serves Jehovah in its own wrong way, that the seats of its worship have become centres of oppression and licentiousness, the historians represent it as forsaking him altogether, now and then or continuously. The explanation is easy. The Mosaic law, as defined in the Pentateuch, a production of a later date than the books of Amos, Hosea, or Isaiah, is the standard of the historians. Judged by this standard, the popular religion was anything but Jehovism. What the people had done in all sincerity to the glory of Jehovah, worshipping on every high hill and under every green tree, conflicted with so many injunctions of the later law that the historians could only regard it as equally abominable with idolatry itself, as apostasy from the national God. To inculcate the sinfulness of such practices was, besides, still the duty of the hour. And had not Jehovah himself condemned the past? Had he not cast away Israel in his wrath? "The fathers upon whom it had fallen had not served Yahweh." They must be branded as idolators.

Priests and prophets were the instructors of the people in the name of Jehovah. The priests acted mainly as judges, as dispensers of divine decisions as to right and wrong. They shamefully neglected their duty and shamefully abused their position, as the canonical prophets tell us in scathing words; but the reproofs themselves, and the ideal of the sacred calling held up to the judges in reproof, bear witness to the ethical character of Jehovah, whose servants they were. This ethical character of the national God is a trait—the great distinctive feature—not only of the prophetic, but of the popular Israelitish religion. Priests and prophets for many centuries formed special social orders. Originally the two stood in close connection with each other. Samuel united in his person the priestly with the prophetic function. But there is no trace to be found of a connection of the prophets with the altars and sanctuaries of Jehovah. Neither was the prophetic office ever regarded as hereditary, as was that of the priests. There are marked points of contact as well as of distinction between priest and prophet. "Both passed in the eyes of the people for the trusted interpreters of the Deity. But whereas the priest was thus gifted in virtue of his office and as the bearer of a consecrated tradition, and was accordingly referred to on the ordinary occasions of life, such as the administration of justice, the privileges of the prophet were more personal, . . . momentary and intermittent. The prophet is the *organ extraordinary* of Yahweh, and as such the natural counsellor in the perplexities which the oscillations of fortune or the uncertainties of the future bring upon Israel." Prophecy, whatever its origin may have been, was an integral part of the national life in the Hebrew states. The people saw in it a proof of Jehovah's special favor. In times of gloom they were comforted by the trust that the word of Jehovah would never fail the prophet.

"The consciousness of standing in connection with a higher world, of being inspired or impelled by the spirit of God, is in itself glorious and exalting. In spite of the aberrations to which it is exposed and the abuses to which it too readily lends itself, we may yet aver that *power* goes forth from its consciousness, power for the cleansing of the inner man, for the support of self-sacrifice and heroism. But if it is artificially excited and cultivated, if there is a premium, so to speak, on ecstasy, and its absence makes a man unfit for the chosen task of his life, then it becomes a very different matter. *Corruptio optimi pessima.* What is more miserable than assumed transport of spirit and pretended divine inspiration? The application of this to the prophetic *order* is too obvious to need pointing out . . . But—and here we come to the second point—might we not expect *a priori* that some few eminent personalities would rise up from the order itself, or would be fired by the example of its members, and would realize the idea of prophecy? . . . The low level of the prophetic guild, as a whole, and the degeneracy of prophecy in some of its representatives, are sufficiently obvious. But in like manner the eminent exceptions of which I have spoken are known to us from history. I have but to name Samuel, Nathan, Elijah, and Elisha. . . . The prophets whose names I have mentioned are distinguished by their moral earnestness and courage. Samuel—Saul; Nathan—David; Elijah—Ahab and Amaziah: I have only to put these names side by side to make my meaning obvious. . . . This brings us back to the ethical element in the conception of Yahweh on which we have already fixed our attention. It was in those prophets whom it had most deeply impressed, who were most completely penetrated by the stern and inexorable character of Yahweh's moral demands, and had therefore become the preachers of righteousness, that prophecy reached its full dimensions and bore its ripened fruit."

The earlier prophets relied upon their spoken word; in the eighth century B. C., the prophets began to write down the word previously spoken. "Israelitish literature dates from this century, or at all events from not much earlier." The national songs were then written down, collected, and provided with historical notes; out of these beginnings historical writing developed itself. Thus also arose—six or seven hundred years after the time assigned to Moses—"presumably in priestly circles, the earliest collections of laws and moral exhortations, one of which we possess in the Book of Covenant (Exod. xxi.–xxiii)." The pen proved powerful, and the prophets, too, grasped it to extend their influence beyond the circle of their hearers and the hour in which they addressed them. The prophet's character remained the same after he had become an author. Amos and Hosea are the legitimate successors of Elijah and Elisha—the organs of Israel's national God. "*Yahweh Israel's God and Israel Yahweh's people!* It surely needs no proof that the canonical prophets endorse this fundament conception of the popular religion. . . . The whole of their preaching takes this as its starting point, and leads back to it as its goal." They anticipate evil days for Israel. Jehovah will chastise and humble the sinful nation—but he will not wholly destroy the house of Jacob. Humbled Israel is to be restored to new life, transformed. Jehovah makes a new covenant, and writes it on his people's hearts. "But, however great the change may be, though the wolf lie down with the lamb and the suckling child play by the adder's hole, nay, though there be new heavens and a new earth, yet the relation between Yahweh and Israel remains the same." On this point, Amos, Hosea, Isaiah, Jeremiah, Ezekiel, and even Deutero-Isaiah are unanimous; all stand on the ground of nationality. And yet there is a mighty difference between the notions of the people and the thoughts of the prophets; the antagonism is as undeniable as the kinship; the divergence sometimes amounts to hostility. This is surprising, but far from inexplicable.

The prophets are completely dominated by the inviolable moral law. They are the champions of the inexorable demands of Yahweh, the Holy, the Righteous One. They are preachers of repentance, and announce disaster, for the people are unrighteous. Oppression, extortion, perjury, impurity defile the land, and Jehovah *cannot* leave such guilt unpunished without renouncing his own moral nature; woe then to the guilty nation! This profoundly ethical conception of Jehovah's nature and designs brings the prophets into conflict with the beliefs of their people. The latter see in Jehovah only their protecting God, the always ready defender of his people. He is righteous, but King of Israel above all. He sometimes hides his face in anger, but only for a while. He can and must be appeased by more numerous vows and offerings. He will not and cannot abandon his people. His own honor demands his people's victory. His obligation to display his might against its foes and their gods must overbalance the demands of his righteousness and the trespasses of his worshippers. "Is not Jehovah in our midst? No harm will overtake us!" And this very confidence the prophets not only did not share, but they denounced it as both vain and sinful. According to them it was not absurd to think that Jehovah might side with Israel's foes. Nay, they declared that Jehovah himself brought those enemies upon them—the Assyrian, the Babylonian. They ascribed more might to Jehovah than the people dreamed of; but with them righteousness was his *character*, not only an *attribute;* and he *must* act in accordance with it; he might renounce his people, but could not renounce himself. The people and the popular leaders could not see this. To them such unpatriotic belief was both treasonable and blasphemous. On the convictions of the prophets themselves, on the other hand, the recognition of Jehovah's ethical character had a marked influence. Jehovah ceased to be what he was in the estimation of the people, the mightiest of the gods. He stood not only above the gods, but in most distinct opposition to them. "If Yahweh, the Holy One, was God; if he was God as the Holy One, *then the others were not.* . . . *Monotheism* was the gradual, not the sudden result of this conception." With it grew the august idea of the moral government of the world, of which even the conquering Assyrian was recognized as a blind tool. And the day was looked for in the future when the Assyrian himself and the Egyptian, his rival, would willingly serve Jehovah, and unite with Israel in worshipping him; when all the nations would serve him with one accord —though the word of Jehovah would still go forth from Jerusalem. Isaiah, Micah, Zepha-

niah, have all glorious visions of the remote future; the universalism of Deutero-Isaiah takes the highest flight—but even he is not free from the spiritual shackles of nationalism.

Not one of the prophets ever thinks of severing Jehovah from Israel. But their ethical conception of religion has modified the traditional bond uniting God and people. "You alone," speaks Amos's Jehovah to Israel, "have I known of all the races of the earth: therefore I shall visit all your sins upon you." The selection, instead of offering immunity, involves severe judgment. Isaiah's Zion is inviolable, as the seat of Jehovah, but only the remnant which repents shall escape destruction. This remnant bears in itself the holy seed from which a new, true people of Jehovah is to spring. Isaiah appears to have gathered that remnant around himself—it embraced his family, spiritual kindred, and disciples—and placed it over against the people. His separatism "is a remarkable token of the growing independence of Yahwism, a milestone on the way which it must traverse in its course from a national to a universal religion." Nascent universalism reveals itself still more strongly in the tragic figure of Jeremiah, whom we see standing almost alone, with his faithful servant Baruch, against his whole people; hunted as a traitor, because to him Zion is not inviolable. Zion, its temple, and Judah must go down; the old covenant is abolished; Jehovah will strike a new covenant with a renewed Israel, a covenant fitted and destined for "many peoples." Deutero-Isaiah's universalism embraced all the peoples; Israel, "the servant of Jehovah," is to be their teacher, their "light."

But Israel was not prepared for the task. The prophets had not succeeded in sinking their conception of Yahwism into the consciousness and life of the nation. Their activity was too fragmentary for the radical transformation they aimed at. They must have felt it themselves. King Hezekiah's measures for purifying the worship were probably the result of their own experience and advice. This reformation did not last. Hezekiah's successor hastened to undo his work. The reformation achieved in the eighteenth year of the reign of Josiah was grander in its scope. In that year, under Hilkiah's and Huldah's auspices, a book of law—Deuteronomy, "to give it the name by which we all know it"—was brought forward and solemnly adopted and promulgated. It embraces exhortations and precepts breathing the spirit of prophecy, legal statutes derived from usage or from older lawbooks, and—what is a distinctive feature—ordinances prohibiting religious service at the *bāmōth* and confining the worship of Jehovah to the temple at Jerusalem. By this centralization of the cultus—a field untrodden by his predecessors, the prophets—the Deuteronomist proposed to extinguish idolatry and make his ideal Jehovism supreme in the land. "The Deuteronomic thorah gained what its champions desired—the opportunity of revealing itself in itsmig ht, and exerting its influence uncontrolled. . . . *Yet none the less it failed.*" Josiah's death at Megiddo and other disasters allowed no time for its working and development. Pure monotheism could not take root at the central sanctuary itself. Jeremiah despaired of Zion; the Chaldean destroyed it. It was in the captivity only that the Israelites outgrew idolatry. But Jehovism continued to assert itself with little vigor among the people even after the restoration, and it was as late as the middle of the fifth century B. C. that, through Ezra and his priestly law—now embodied mainly in Exodus and Leviticus—Jehovism became completely *the religion of the Jewish people*, in a new form. Ezekiel and other priests had paved the way for Ezra. 'What the prophetic preaching had failed to effect, what Deuteronomy, the prophetic thorah, had only half accomplished, that was brought to pass by *Judaism*." The ties of nationality were now drawn more closely; the Jewish people fenced itself round with observances; separation was the watchword under the priestly thorah, and its expounders the Scribes, but the international and universal elements were by no means wanting. "The stranger that dwelleth with you shall be unto you as one born among you, and thou shalt love him as thyself," is an injunction of the priestly law. Judaism was modified in the colonies; Jewish Hellenism arose. The universalism of the prophets was imbibed from their sacredly guarded pages. Proselytism extended the Jewish community. "Judaism was by no means without consciousness of its own broader destiny." And out of it, not out of "Roman Hellenism"—as Bruno Bauer attempted to show—grew the world-religion Christianity.

ILLUSTRATED HOLIDAY BOOKS.—II.

Original Etchings by American Artists. Cassell & Co.

Sport with Gun and Rod in American Woods and Waters. Edited by Alfred M. Mayer. The Century Co.

It would have been just as well if the publishers of the superb volume of 'Original Etchings' had frankly and resolutely adhered to the pretension of their title, and limited the contribution to American artists—*i. e.*, to the works of men who, if not born on this side of the Atlantic, have received their inspiration or their education, or both, in this country. Nor would the work have lost in character, since it so happens that the best plates in the volume are by the American contributors; best not only in the sense of the most successful, which is not always the same thing, but in the evidence of the possession of the artistic inspiration which marks the painter born. Farrar, DeHaas, Gaugengigl, Dielman, and Van Elten are in no sense of the word American artists, nor have they become artistically so naturalized as to have thrown off their old allegiance and caught American ways. This is no reproach and no disparagement of their artistic value: it is simply the impeachment of any right to stamp them as American, be it for worse or better, and to include their work in a collection professedly limited to American art work. The artists named, with the exception of Mr. Farrar (who has no special manner), are distinctly European in every element of their art, as they are of birth and art education; and they have no more right here than Seymour Haden. But, as it happens, the best etchings here given are by men at least as distinctly American as Moran, whose "Tower of Cortes" might be awarded the palm, the "Twilight" of Mr. Monks being admitted to dispute his claim; and if solemnity of feeling and simplicity of treatment are to be reckoned as cardinal virtues in art, the latter may even be given the first place. In its florid pictorial way, for its masterly suggestion of form, and the disposition of its masses, the "Tower of Cortes" certainly reaches as high ground as anything we know of in contemporary landscape engraving. "Gloucester Harbor," by Stephen Parrish, is a large and vigorous rendering of a bit of home material, admirable in its way, and as simple as it is vigorous—clear and honest etching throughout. Mr. Wood's "His own Doctor," fine and subtle as a subject, is treated in the etching in a large and frank manner, which gives the old negro a pathos and human interest which the least extravagance in treatment or caricature in conception would have destroyed. Mr. Gifford's "Mouth of the Apponigansett" is a simple, forcible rendering of a homely scene, well felt, and with a dreary stretch in its distance which is expressed in firm lines, full of meaning, the distinct fault being in the meaningless long lines of the near water. The Smillies' plates are both fine in different ways—the "Marblehead Neck" in its delicate rendering of tone and its balanced composition, and the "Old Orchard" in its vigorous and luminous distance against a simple sky, with a quaint composition motive. Mr. Church's "Lion in Love" is not up to the level of other of his designs we have had to notice, and is ineffective as etching. Pennell's "Ponte Vecchio" is a curious failure—inky, and without air or general effect, and singularly inadequate to the motive. Colman's "Venice" is the conventional fishing-boat city-by-the-sea, with a sky that suggests an eiderdown coverlid, but still a pleasant etching, with air and space and tremulous water. Farrar's "Winter Twilight" has nothing genuine about it—no shadow from his twilight, no woodiness in his trees, no solidity in his earth, no invention in his forms, and no breadth in his masses; neither naturalistic nor artistic, but evidently made out of his inner consciousness.

The literary introduction and interludes are worse than wasted. Two such pages about the ancients as accompany Mr. Colman's "Venice," with no allusion to the etching, and no intelligible one to Venice, are enough to make one question the direction of the writer's ideas. We should like to know who is the German "philosopher," as the writer calls him—we should use another word—from whom he quotes the following nonsense, "that the subjective element in a work of art is simply the base peculiarity by the admixture of which its indwelling spirit is contaminated." If this is not a man of straw set up for Mr. Koehler's easy knocking over, we should like to know more of his personality. The introduction is four pages of dreary wordiness, windily disputing a proposition in the clouds, viz.: that etching is not able to do what we see it doing every day.

The pith of the dissertation which forms the introduction of the book may be gathered from the following:

"That etching is a linear art—that is to say, an art which must use the line as a means—is a truism. It is not true, however, that the line can express form only, or any one other thing only. If that were so, line engraving and the woodcut would never have come to be looked upon as the reproductive methods best fitted for the translation of finished paintings. However, as compared with the methods just named, etching has other advantages, which must not be lost sight of: the freedom and *warmth* of its line, the brilliancy to be obtained by judicious pointing, the subtilty supplied by *its inseparable adjunct, the dry point.* . . . The doctrine of limitation is, I fear, the outcome only of individual limitations. But it behooves the calm observer, who stands outside the charmed circle of art, unswayed by the passions that rule within, to rise above them, and to recognize the truth that the beautiful art of etching is as broad and as all-embracing as the capacities of the human mind."

Broader than such dissertation it may be, but not flatter or shallower. In spite of the editor, however, the 'Original Etchings by American Artists' is one of the most noteworthy and valuable art publications which American art has given birth to. With the exception we have pointed out, there is not a poor etching, and only two or three weak ones, in the series.

Professor Mayer's 'Sport with Gun and Rod' is a large quarto volume of nearly 900 pages, divided into four departments, with the respective titles of "Large Game," "Fish," "Feathered Game." and "Out of Doors." It begins with an appropriate and interesting introductory article, by the editor, on the "Prehistoric Hunter."

Next comes one on the black bear, by Mr. Ward, which is written rather from the standpoint of an artist or naturalist than a sportsman, though Mr. Ward shows himself fully competent to deal with his subjects in the latter relation when he comes to write about caribou and moose-hunting further on. These are among the best things in the book, and particularly happy in their descriptions of the characteristics and modes of speech of the Indian guides, as well as of the habits of the game. There is also an excellent description of moose hunting by the Earl of Dunraven, and of musk-ox shooting by Lieut. Schwatka. "A Buffalo Hunt in Northern Mexico," by Gen. Lew Wallace, carries with it an idea of imaginative flatulence that very much weakens its effect. For instance, on p. 126: "The fisherman who has landed a ten-pound golden salmon from the golden beds of the Kankakee can tell you my feelings." (He had just shot a bison after a couple of pages of fine writing, and his emotions were evidently inexplicable.) Now the "beds of the Kankakee," a sluggish stream of eastern Illinois, are more muddy than auriferous; there never was a live salmon within 500 miles of them; and if Gen. Wallace had ever seen one anywhere else, he would not have described its color as "golden." The remainder of this article can be better comprehended if the reader has a fair knowledge of the Spanish language, which is scattered throughout it with liberality, largely in the form of expletives.

In addition to those already mentioned, we would specify chapters on "Fox Hunting in New England," "Bear Hunting in the South," "Mule Deer and Wild Sheep," as well worth reading in the space devoted to "Large Game." The part on "Fish," consisting of six or seven articles, is begun with "Trout Fishing on the Rangeley Lakes." The waters about the Oquossoc club-house are those described, and Mr. Seymour shows conclusively throughout his chapter, to one familiar with the place, and an angler, that he depended more on what was told him than on his own experience for his facts. Most of the large fish, calling those over four pounds such, taken in the Rangeley waters, do not, we are sorry to say, come to their death through the arts of fly fishers; and in the days whereof Mr. Seymour writes, the favorite, though not ostensible, mode of catching them was, in the early season, by ground-baiting a likely spot with a few quarts of hashed chubs, and next day fishing it with a bait of the same. In the autumn the largest trout taken were from the spawning beds, and that in some instances with a bait of trout roe—all of course being credited to the fly, though the largest one we have ever known taken in these waters in this manner during the early fishing, was killed by the late Mr. Dawson, and weighed, as we recollect, five pounds and a quarter. There has, we believe, been a change for the better in the way of fishing of late, and less is heard of trout of eight, nine, and ten pounds, though such are undoubtedly still there. Dr. Henshall, who is the authority on this game-fish, writes interestingly and reliably on the black bass; and Mr. Thaddeus Norris's chapter on "The Michigan Grayling" is as accurate and trustworthy in its descriptions and information as everything he has written about his favorite pursuit of angling. "Salmon Fishing" is the subject of a contribution by Mr. Wilkinson, who narrates his first experience in the art, which took place on the York River, Canada. After a capital article on "Sea-Bass Fishing," and another on "Sea-Trout Fishing," the angling portion of the book concludes with brief chapters on the length and weight of brook trout and "The Split Bamboo Rod." As much prominence is given to the merits of these rods, not only in this article, but incidentally in some of the others, we may say, for the benefit of the tyro who dreads the great necessary outlay for their ownership, that there are other rods, not quite so handsome, but much more durable under hard service, to be had for from one-quarter to one-third the cost.

The last third of the volume is devoted to "Feathered Game" and "Out of Doors," including two able articles on "American Sporting Dogs" and "The Shot Gun," and is written with much more absolute knowledge of its topics, as a whole, than the matter which precedes it. Among the best, besides those above mentioned, may be specified the chapters on "The North American Grouse," and, barring its somewhat pretentious title, "Bob White, the Game Bird of America." As an appropriate appendix, Mr. C. D. Warner is represented by two of the monographs which have brought him into fame as a sporting author—"How I Killed a Bear" and "A Fight with a Trout," the latter a most delightful satire on the ordinary angling literature of the country. "How to Mount a Bird" and "Bow Shooting" end the book, which is excellently printed and contains many beautiful illustrations, a number of which are mounted on Japanese proof paper. In the article on "Striped Bass" there is one wrongly credited to Walton's 'Complete Angler'; it is the well-known one from Dame Juliana Berners's 'Treatyse of Fysshynge with an Angle.' Another, on p. 446, represents the impossible feat of one man in a sitting posture poling a canoe and fisherman up the centre of a heavy rapid.

The Century Company is entitled to much praise for this the most considerable effort in this country to bring out-of-door sports to the public notice, but there is chance for improvement and greater accuracy in the selection of material for future volumes which it is hoped may follow this. A man to write on sport up to the demands now existing, and which long have existed in England, must know his subject thoroughly. One short experience in angling, or a few days' shooting, do not yield sufficient store of knowledge, even when supplemented by such information or misinformation as the amateur may pick up on his trip, to qualify him to write as an "expert," by which class we believe one of the advertisements claims that this book has been composed. A number of the contributions bear conclusive evidence that their authors understood their subjects and were themselves sportsmen; others, and these not the least interesting to the general reader, the reverse. As models of writing of this kind, not only in composition, but from the point of view of the sportsman and naturalist, we might mention the various books of John Colquhoun and Scrope, and Chas. St. John's 'Natural History and Sport in Moray.' These writers had, in addition to the true sportsman's zest in the pursuit of game, the love of the naturalist for ascertaining and describing its habits and modes of life. Mr. St. John added to this power that of making vigorous and life-like pen-and-ink sketches of the game he captured, which adds wonderfully to the attractions of his book. Books and even articles on sport, of the first class, should be written by men who are accomplished in the art, love it, are naturalists, educated, and truthful.

RECENT POETRY.

THE multiplication of good books of poetical selections shows the approach of Christmas-time. Best among these we should rank a new edition of Sir Francis Palgrave's well-known 'Golden Treasury,' with a continuation embracing selections more recent than those contained in the original work, the whole being edited by Mr. John Foster Kirk (Lippincott). The additions are fairly good and so is the preface. But Mr. Kirk makes a slip in saying that Blanco White "wrote no poetry besides his famous sonnet" (p. viii.), for his other sonnet, "On hearing myself for the first time called an Old Man," is really, as Mr. Caine has pointed out, "quite as admirable in point of technique," though not in thought, as that other production which Coleridge placed at the head of British sonnets.

Next to this volume we should place 'Fair Words about Fair Woman,' gathered from the poets by O. B. Bunce (Appletons). Here we have all needed sumptuousness of type and paper, and many fine poems, with prose interludes in the form of conversation, the whole being divided into eight "evenings," somewhat after the fashion of William Morris and the Italian story-tellers. To confess the truth, these prose pages do not afford a setting quite good enough for the gems they present, being indeed a little crude and sometimes almost flippant; it would have been better if "Bachelor Bluff" could have been kept to his own domain, which is certainly not that of ideal poetry.

It seems a curious transition from 'Quiet Hours' to 'Classic Heroic Ballads,' but the compiler of the former well-known collection has edited the latter also (Roberts Bros.). It is an admirable book, and should go with Froissart and Plutarch into every boy's library. The selections seem to us very nearly perfect; not quite, for Thornbury has ballads yet more vigorous than "The Cavalier's Escape"; and the author gives the weaker and diluted version of "Scots wha hae," instead of the stronger one. "On to glorious victory" can never have the ring of the original "On to victory"; and so with the last line of every verse. True, Burns himself made the alteration, but it was against his own better judgment.

The three volumes which complete the series called "English Verse" (Scribners) only confirm the opinion we have already expressed as to its merits and defects. In respect to quantity of matter they confirm the original promise of the prospectus, but in no other way. We are still left without alphabetical indexes of authors; still find a provoking inequality of execution. The volume of 'Dramatic Scenes and Characters' strikes us as by far the best, and in the preliminary essay Mr. Stoddard is on ground where he is strong. In the volume of 'Ballads and Romances' his work seems more perfunctory and his knowledge incomplete. He not only does not refer to the existence of Professor Child's great critical edition, now in process of publication, of English and Scottish ballads, but when he mentions that eminent editor's name he calls him "Childs" (p. xvi.). Least satisfactory of all the series is the volume of 'Translations,' in which there is a wide and creditable range in the languages represented, but a provoking narrowness in the selection of translators. Under Æschylus we have nothing from Browning or Fitzgerald; under Euripides, nothing from Milman; under Sophocles, nothing from Whitelaw; under Aristophanes, a version of the "Birds" far inferior to Cary's; under Theocritus, a translation not so characteristic and vigorous as one or two made by Mr. Stoddard's own friend Stedman. In the modern languages, it is worse. Longfellow's 'Poets and Poetry of Europe' is not even named among the authorities, nor is there a single translation by him; while the "Indian Song of Songs" and its fine companion ballads, by Edwin Arnold, are also omitted. Aubrey de Vere's Irish legends give a better impression of that remarkable school of tradition than any here included, and Mr. Linton should have

given at least one translation from Béranger from some other hand than his own. To render a line

"Of her great beauty raved *enthusiastly*" (p. 155)

is to give a very poor equivalent for the precision and clearness of the great French singer.

Some editor of an anthology of translations might well draw freely from a good rendering of 'The Odes of Horace,' by Henry Hubbard Pierce, Adjutant of the Twenty-first U. S. Infantry (Lippincott). As if there were some inherent doubt as to the scholarly trustworthiness of a book dated at Fort Vancouver, Washington Territory, the author's classicism is duly vouched for by Professor Fries, of Michigan University; but the translation tells its own story, and offers one a good deal of the soul of Horace in small space. We cannot so easily perceive the *raison d'être* of a volume called 'The Agnostic,' by another representative of the same family name, the Rt. Rev. Henry Niles Pierce, Bishop of Arkansas (Whittaker). The trouble with this work, as with most of the polemic writings of bishops, is that it simply puts up a man of straw to be knocked down. There are many who call themselves agnostics and yet distinctly recognize, in their own way, all that the worthy Bishop here claims.

The Rev. Mark Pattison's delightful little edition of Milton's 'Poems' (New York: Appleton) attempts nothing dangerous in the controversial line, but keeps to the still air of delightful studies. He gives translations by different hands of the Italian sonnets, and copious notes upon all. If we were to criticise the book, it would only be for too great insistence upon the Italian form of sonnet, which is rightfully now accepted as supreme, but must not blind us to the peculiar value of the Shaksperian form, the manner in which the closing couplet seems to give a completeness to the whole poetic structure, and sums up the meaning, while its music breaks like the tenth wave along the shore. Shakspere really created a distinct form of verse, as well as Petrarch, though the Italian's has proved more enduring; and to say, as Mr. Pattison deliberately asserts, that "it was an unfortunate choice of vehicle when Shakspere selected the sonnet form" (p. 42), seems clearly one of those instances where a critic simply criticises himself, marking his own limitations, not those of his author.

It is an easy transition from Italy to Mr. William W. Story, if indeed it be a transition at all. That perennial youthfulness of temperament, shown in so many ways by this accomplished artist, and forming a trait so agreeable in a man of sixty-four, was never more strikingly shown than in his little volume called 'He and She, or a Poet's Portfolio' (Houghton, Mifflin & Co.). Both the verse and prose are very much such as he might have written in his exuberant youth in Lowell's *Pioneer*, of which he and Lowell contributed, under various pseudonyms, so large a part of the table of contents. Mr. Story himself was perhaps the best American type of what may be called the Crichtonism of that period—the theory, namely, that a brilliant young man might, could, would, and should try his hand at everything. 'Pelham' and 'Vivian Grey' were then still read, and the age of specialists had not begun. Not content with being lawyer, sculptor, and musician, Mr. Story experimented in painting, like Page, and in poetry, like Lowell; and while he did nothing very ill, he could not do everything well. We cannot find in this dainty volume anything that quite justifies its existence; yet many young people will relish it, though perhaps less vividly than their parents would have enjoyed it forty years ago.

Neither Mr. Aldrich nor Mr. Whittier will win many added laurels by the thin volumes containing this year's harvest of verse. Yet they will lose none, and this for two bards so well established is perhaps enough. The greater part of Mr. Aldrich's book, 'Mercedes, and Later Lyrics' (Houghton, Mifflin & Co.), is occupied by a dramatic sketch which is really very powerful, but which has the defect, quite unusual with this author, of presenting too unmixed a tragedy. All the canons of criticism demand some relief, and the monotone here struck makes the work seem rather like a study for a drama than like the finished performance itself. Mr. Whittier's book, 'The Bay of Seven Islands, and other Poems' (Houghton, Mifflin & Co.), gives us a few more of those versified New England legends of which we can never have too many. The aged poet has fulfilled the dream of his youth, and has become the Burns of his native region, having peopled the Merrimack and the Bay of Seven Islands with a race of ideal denizens as lasting as the imaginary clans mustered by Scott on Lanrick Mead. The shades of evening group themselves insensibly, but not sadly, over the poet's muse, and are touchingly expressed in a poem, "What the traveller said at sunset." The opening verse in particular has an image unusually daring for our moderate bard (his night thrush being, as we take it, the veery, which he has elsewhere sung):

"The shadows grow and deepen round me,
I feel the dew-fall in the air;
The muezzin of the darkening thicket,
I hear the night-thrush call to prayer." (P. 47.)

Mrs. Celia Thaxter, who always impresses one as being a spiritual child of Whittier, has collected her 'Poems for Children' in a handsome but feebly illustrated volume (Houghton, Mifflin & Co.). The verses are sometimes over-thoughtful for very young readers, and are sometimes weighted, like Whittier's, with a superfluous moral at the end; but they are graphic, wholesome, and so full of genuine American life as to be good nutriment for all children.

Mrs. Anagnos shows hereditary talent in her poems, 'Stray Chords' (Boston: Cupples, Upham & Co.). Her mother, Mrs. Julia Ward Howe, has, perhaps, surpassed her in the condensed and finished utterance of a few poetic thoughts, as, for instance, in her "Rouge gagne"; but, on the other hand, the daughter escapes the turn for mysticism and abstruseness which mars most of the mother's poetic work, and which will forever prevent even the "Battle Hymn of the Republic" from being in a wide sense popular. Mrs. Anagnos has a dangerous facility of versification, but she has great purity and elevation of tone, and often shows real power of imagination. Among the poems which have most creative force we should select the following:

"THE NUN.

"Mouth, fair fount of frozen kisses;
Eyes, sweet sepulchre of blisses;
Brow, dear temple of dear joy;
White veil, clouding all so coy—
Wine to ice, and youth to age,
Change upon thy lovely page.

"Spring flowers struggling o'er a tomb
Seem thy fitful smiles and bloom;
Tender birds by Winter caught,
Sweetest buds by Winter taught
Not to open, not to sing,
For it never can be spring.

"Take me to that heaven of thine,
Where the moonbeams palely shine,
Where the roses bloom but white,
Where the stars are shy at night,
Where the breezes dare not sigh,
Where the heart must freeze and die—
I will shudder, pleasure flee,
If I may but worship thee." (P. 135.)

Mr. Denton's singular book, 'The Early Poetical Works of Franklin E. Denton of Chardon, Ohio, author of the Glass Dwarf' (Cleveland, Ohio: Williams), seems rather like a series of strains from one of the half-insane seers in 'The Bread-Winners' than like a serious production. What else can we say to such passages as the following:

"HYMN TO THE SUN.

"O Sun, hell wandering up the firmament!
God smiled! thou wert! thou art a laugh of Him!
I, but an one of all the billion ghosts
That wail and storm around this whirling world
In the delirium of consciousness.
How can I hope my wingless syllables
Will ever reach the golden ear of thee?
Thee who beheld the world travailed! beheld
It, ocean-robed, roaming a purple ball,
Coruscant in the chrism of thy beams!" (P. 20.)

Or this:

"How sweet to toss the bridle from our feeling,
Although to mind and body it bodes ill,
And from conception let our thoughts go reeling,
If they but be incongruous, at will;
Ere cachinnation is our teeth revealing,
To have the lachrymal its liquor spill;
To be an April day, for illustration;
An antithetical exaggeration." (P. 170.)

Mr. Denton is yet but twenty-three, and may possess talent; but not much is to be hoped for the future of a youth whose very sponsor and adviser, "A. G. R.," of Washington—presumably Mr. A. G. Riddle—selects for compliment, in his preface, such singular phrases as the following:

"I am a pinioned misery, Allana."

Perhaps Mr. Riddle would also commend the line—

"Earth is a gorgeous sponge soaked with divinity."
(P. 29.)

The preposterous phraseology of Mr. Denton is that of rawness and youth; but the curious dialect of Mr. P. W. Norris in 'The Calumet of the Coteau, and Other Poetical Legends of the Border' (Lippincott), forms really the most valuable part of his book, although it swamps his poetry, so to speak, in pigeon-English. The author was for five years superintendent of the Yellowstone National Park, and a guide-book to the park appears as an appendix to this volume, while the main portion is devoted to songs and rhymed narratives, often of the crudest description, but generally involving some local or historic if not poetic interest. A dozen pages of glossary will seem none too much to one who opens upon such a passage as the following:

"Il-la-hi, you come to see,
Lo-lo-io you want to be;
Chis-wout sk-o-kum, bold you come,
Mos-mos, stupid to your doom,
Ab-sa-ra-ka, tli-la-cume.
Que-u-que-u, lance and plume,
Min-ne-ke-wa cannot save,
Min-ne-wa-wa branches wave,
Kam-ooks gaunt around you glare,
Ka-kaws circle in the air.
By the blood of kindred slain,
Thine shall lance and fagot drain.
I-san-tau-ka, feel our ire,
Wa-kan-sche-cha, in the fire." (P. 105.)

As if to show that neither Ohio nor Idaho can monopolize uncouth phrases, we have in the choice type of Macmillan a specimen of English eccentricity in 'Poems and Lyrics, or the Joy of Earth,' by George Meredith. If Mr. Matthew Arnold finds in Emerson's quaintnesses reason enough for setting him far below the smooth Longfellow as a poet—a judgment, to be sure, which does not command our sympathy—what will he say to such freaks of his own cultivated fellow-countrymen, who knock Pharisees on the head with such clumsy bludgeons as this sonnet?

"A CERTAIN PEOPLE.

"As Puritans they prominently wax,
And none more kindly gives and takes hard knocks.
Strong psalmic chanting, like to nasal cocks,
They join to thunderings of their hearty thwacks.
But naughtiness, with hoggery, not lacks
When Peace another door in them unlocks
Where conscience shows the eying of an ox
Grown dully apprehensive of an Axe.
Graceless they are when gone to frivolousness,
Fearing the God they flout, the God they glut.
They need their pious exercises less
Than schooling in the Pleasures: fair belief
That these are devilish only to their thief,
Charged with an Axe nigh on the occiput." (P. 170.)

It is pleasant to pass to the grace and sweetness of another volume of English authorship, the 'Idle Idylls' of Edwin Arnold (Roberts Bros.). Those who were disappointed in 'Pearls

of the Faith' may turn confidently to this new book to find in it companionship for his 'Light of Asia.' He now gives us versions of passages from the great Hindoo drama, the 'Mahâbhârata'; in "Savitri, or Love and Duty," we have an Oriental Alcestis—as exquisite a tribute as was ever paid to the strength and self-devotion of woman; and in "The Great Journey," a picture of sublime disinterestedness, high as the Christian doctrine, and far higher than the accustomed Christian practice. The work is appropriately dedicated to one of those who, in the *Dial*, first urged the Oriental Scriptures on the English-reading world, Rev. William Henry Channing, Mr. Arnold's father-in-law.

Since the publication of so great a literature of Oriental translation made at first hand, within twenty-years, books made at second hand have lost much of their value. Rev. W. R. Alger's 'Poetry of the Orient' (Roberts Bros.) was one of the best of these, and will still no doubt find readers. Mr. Alger adds to this new edition some poems of his own, not Oriental in their character. Being a Unitarian clergyman, he of course writes poetry; but not so good, to our thinking, as that of his companion in that faith, Rev. John W. Chadwick, whose 'In Nazareth Town, and other Poems' (Roberts Bros.) contains many good things. One of the best has valuable local coloring, being a poem of Marblehead, called "Mugford's Victory."

Local coloring is to be found in very lively shape in 'Whispering Pines,' by John Henry Boner (New York: Brentano); and the few specimens which he gives of the plantation dialect will be likely to win more readers—in these days of 'Uncle Remus'—than the author's hymns or poems about external nature. The following, at least, has an irresistible ring and swing to it:

"CRISMUS TIMES IS COME,

I.

" Wen de sheppuds watch de sheep on de plain of Befle-
hem
(Crismus times is come,)
Dey was 'stonished at de star dat went a-swinging ober
dem,
(Crismus times is come;)
Dey lean upon de sheppud crooks a-shadin' ob der eyes,
(Crismus times is come,)
An' dey know de sun ob glory was a gwine for to rise,
(Crismus times is come,)
De wise men walk wid der heads ben' low
'Twell dey hear a ban' o' music like dey nebber hear
befo',
An' de angels come a singin' wid de stars in der han's
An' der flamin' wings a-shinin' on de heathun lan's.

II.

" De kings of de erf woke up dat night,
(Crismus times is come,)
An' der crowns look shabby in de hallyluyer light,
(Crismus times is come;)
But de po' man riz en tuck his ole hat down,
(Crismus times is come,)
An' hit look so fine dat he fought it wer a crown,
(Crismus times is come,)
Ole Jordan roll high en ole Jordan roll low,
An' de star stood still whar de folks had to go,
An' de angels flew away agin, a-singin' arter dem
A blaze road from Juda to de new Jerusalem.

III.

" Den pile on de light 'ood en set aroun' de fire,
(Crismus times is come,)
Rosum up de ole bow en chune the banjer higher,
(Crismus times is come;)
Dar's no mo' coonin' ob de log in de night,
(Crismus times is come,)
O glory to de lam' fur de hallyluyer light,
(Crismus times is come.)
De Crismus possum am a-bakin' mighty snug,
So han' aroun' de tumbler en de little yaller jug
Wid de co'ncob stopper, en de honey in de bowl,
An' a glory hallyluyer en a-bless yo' soul." (Pp. 106-7.)

Local coloring of a different fashion also abounds in the rather loose-jointed and ambling verses of Rev. C. Pelletreau, who writes in rhyme 'Reminiscences of the Seventh Regiment, N. G. S. N. Y., in State Camp, 1883' (Whittaker). In curious contrast with this is the essentially Pall-Mall flavor of 'The Poems of Frederick Locker' (White, Stokes & Allen). What is that imperceptible difference in flavor which makes Praed's *vers de société* still readable, after fifty years, while all other poetry of that class is like parched corn, which must be enjoyed while it is fresh and hot, or not at all? Mr. Locker's, we must confess, has already lost its crispness.

A History of Art in Chaldea and Assyria. From the French of Georges Perrot and Charles Chipiez. Illustrated with 452 engravings in the text and 15 steel and colored plates. Translated by Walter Armstrong, B.A., Oxon. 2 vols. A. C. Armstrong & Son. 1884.

THIS second instalment of the translation of MM. Perrot and Chipiez's valuable and extended 'Histoire de l'Art dans l'Antiquité,' the first two volumes of which we noticed last year, will fully sustain the reputation of the authors for ability and fidelity in the task of gathering up the recent results of archæological research and arranging them in a connected series. They are thus producing a history of ancient art such as we have not before possessed. In this portion of their work it is shown that the ancient civilizations of the Tigris and the Euphrates were not less interesting or important than that of the valley of the Nile, notwithstanding that the remaining materials are less abundant, and some important facts less certainly known. In Chaldea are found no such records in sculpture of domestic life and employments as are found in Egypt; its graphic art being devoted chiefly to incidents of worship and sacrifice, to illustration of the military or hunting exploits of its royal personages, and to the realization of supernatural beings or symbolic creatures. The interpretation of Chaldæo-Assyrian inscriptions is, moreover, much less advanced than that of the Egyptian hieroglyphs. Nevertheless, by patient research and comparison, archæologists have succeeded in making out a good deal that was formerly obscure, and have thrown considerable light upon important problems.

Perhaps the most interesting and instructive portion of this part of the work is that which treats of the principles and general characteristics of Chaldæo-Assyrian architecture. This architecture, though, from the nature of the material (mostly sun-dried brick) to which the builder was restricted, exceedingly simple in its forms, is found to have possessed some features that have hitherto been thought to be of more recent invention, and not to have employed others which have been widely attributed to it. Neither piers, columns, nor architraves, and consequently nothing like orders or hypostyle arrangements, were generally employed. It is true that simple forms of shaft, with base and capital, were occasionally used, but they did not form a part of the general constructive system, and our authors affirm that a sufficient account of that system might be given without mentioning them. It was a system in which void spaces bore but a small proportion to the solid construction, and in which there were no apertures except doors. The barrel-vault, however, if not also the dome, is found to have been in general use. All this shows that our former conceptions of Assyrian architecture have been largely fanciful and inaccurate. As lately as the year 1851 so excellent a scholar as Mr. James Fergusson, in his work on 'The Palaces of Nineveh and Persepolis Restored,' made free use of the column, on the principle of the hypostyle halls of Persepolis, and excluded the vault. Until recently the general belief, shared even by Müller, was that all the ancient modes of construction were those of the simple pillar and architrave as employed by the Egyptians and the Greeks, and that to the Etruscans and Romans we owe the introduction of the arch and vault. But Mariette has proved that the principle of the arch was perfectly understood in Egypt in very remote antiquity, and we now find that it was not only known but systematically employed by the Assyrians—that it was, indeed, apparently the only means whereby they could roof their open spaces, possessing, as they did, neither large stones nor good timber.

The use of the dome is not so clearly made out as that of the barrel-vault. But the fact that domical structures are figured on some of the bas-reliefs, and that in a few instances fragments of *pisé*, having segmentally hollowed surfaces, have been found within now roofless square chambers, lends favor to the supposition that it was used. Moreover, the dome is constant in the palaces still in existence of the Parthian and Sassanid monarchs, which belong to an epoch midway between remote antiquity and the Græco-Roman period; and our authors suggest that possibly it may be discovered that ancient tradition helped to direct architecture into a new path in the last years of the Roman Empire. In this connection a class of buildings in Asia Minor is referred to, in which the dome is found resting on pendentives, from which it may not be wholly fanciful to suppose that the architects of St. Sophia were, in important particulars, but perpetuators of the principles established by the builders who wrought under Sargon and Nebuchadnezzar. In all such conjectures regarding derivation, however, it is easy to be carried too far. It may be just as probable that these architectural forms were invented independently at different epochs, and in different countries, in simple obedience to the conditions which called for them. Yet such derivations can often be securely traced, and even when they cannot, these striking similarities are highly interesting and instructive. Not the least so among those which our authors bring out, in what they call secondary forms, though the fact has been frequently remarked by others, is the likeness of one form of Assyrian capital to the Greek Ionic, and of another to the Corinthian. The carrying of shafts upon the backs of sculptured lions and griffins, so common with the mediæval Lombard builders, was common also in Assyria.

The beginnings of sculpture are more obscure in Chaldea and Assyria than in Egypt; but the oldest which is known exhibits, like the rest, a singular proclivity to copy nature. The study of Assyrian sculpture is shown to be especially interesting, not only because it created those anthropomorphic types which were adopted and perfected by the Greeks, but also because it established that principle of temperance in relief for which Greek sculpture became subsequently so remarkable. The Assyrian method had nothing in common with the Egyptian engraved process; nothing of that defining of contours by incised lines, or of modelling beneath the surrounding surface, which were such common practices with the Egyptian carver. There is, indeed, sometimes a slight reinforcing of contours by incision—as in the case of that wonderful wounded lioness in the British Museum; but this incision is never systematic, and the essential character of the work is always that of delicately modelled form rising gently from a flat field with no forced accents. The material used for sculpture in Mesopotamia was generally alabaster or limestone, the softness of which rendered freedom and incisiveness of execution natural; yet, as the authors remark, these qualities are never carried to excess. As far as his skill or his subject would permit, the Assyrian carver wrought his forms into lifelikeness with patience and care. His perception of nature in animals was remarkable. Indeed, there is no thing in antique art comparable to them in this respect, as those remarkable reliefs of hunting scenes in London attest. The Greeks, with their finer and more mature skill, carved the horse, it is true, as no Assyrian had ever been able to

carve it; but other animals they were content to render, when they did so at all, in a very conventional way. The Assyrian, however, presents the horse, the wild ass, the lion, the dog, and other animals with an animation, and an expression of peculiar character in each, which have not been surpassed by artists of any time; and this notwithstanding the apparent fact that in Assyria, as in Egypt, sculpture was regarded primarily as a means of record. All this is set forth and illustrated with admirable justice, and in addition an interesting account is given of minor works in moulded and modelled clay, carved ivory and bronze, both cast and hammered.

Painting in these countries is shown to have been of the same elementary sort that was practised in Egypt, though it differed in minor ways from Egyptian painting. It was but a simple and frank kind of illumination, without any gradation of tint or modelling of form. For interiors the color was laid upon a surface of plaster, according to the usual ancient and mediæval manner of mural painting; but in situations exposed to the weather, recourse was had to the more durable method of enamelling. A very interesting account is given in the chapter on decoration of the varieties of enamelled bricks that were employed, and of the devices that were depicted upon them. In both sculpture and painting the Assyrian artist was prolific in the adaptation of natural forms, among the vast range of which were types, some of them borrowed from Egypt, that were afterwards adopted and amplified by the Greeks. Conspicuous among these is that running border consisting of alternately open and shut lotus flowers, which has supplied the motive for a great many subsequent designs. Thus to discover the origin of decorative types as well as of constructive forms, and to follow them through their successive transformations, finding what peculiar impress each race of men has put upon them, is one of the most instructive modes of study both of the fine arts and of man himself. It is the intelligent effort to do this for the ancient arts that gives this book its value. The only fault of importance which we find in it is that of the diffuseness to which we alluded in our former notice. A great many portions of the book are needlessly spun out, and there are many wearisome repetitions. The substance of the work might have been fully presented in very much less space.

The illustrations in the text do not in all cases compare favorably with those in the original. They are apparently photo-engravings from the original woodcuts; and they have that heavy and smutchy effect in the closely shaded parts which is a constant defect of mechanical engraving. Even the original illustrations are in some respects unsatisfactory. Those representing sculpture are generally poor, and some of them are decidedly bad. That of the wounded lioness, Fig. 80, for instance, conveys no adequate expression of the subtle delineation which the original carving exhibits, and it conveys the impression of something in very much higher relief. But the faults of the book are insignificant in comparison with its substantial worth, and we shall look with interest for the volumes which are to follow. It is, we believe, the only book thus far which by competent hands, and in the light of recent discoveries, endeavors, with adequate fulness, to follow the chain of thought and effort by which man has expressed through the fine arts his moral and spiritual aspirations.

The Little Schoolmaster Mark. By J. H. Shorthouse. Macmillan & Co.

THIS work is called by its author "A Spiritual Romance," and the naming, though ambitious, is not inappropriate. Against a background of court levity and scepticism, the hero stands out as phenomenally religious, and the incidents of the little story are not unromantic. The character of Mark is quaint and beautiful, but its tone of spiritual aspiration and purity would vibrate more strongly in the reader's heart were less jarring discord admitted in the environment. The book is unsatisfactory. One feels as if the author were amusing himself with a graceful sketch, rather than giving the product of his whole earnestness and best endeavor. This impression is perhaps unjust, but is likely to be produced where a writer's real sentiments cannot be clearly seen. In this story, despite the fact that the personages too often lose their characteristics to express, at convenient points, the author's train of thought, his *opinions* remain for the most part undiscoverable. There are fruitful suggestions—as, for instance, this from the conversation of the Princess Isoline with Mark: "I warn you never to join a particular society which proposes as its object to serve God better than others." As may readily be inferred from what has been said, the book, though perhaps meant in part for children, is little suited to them, since much of it, while puzzling or meaningless to many, would be superfluous torment to those able to understand. The author says in the preface: "Should this little tale induce any one, at present ignorant of Stilling's 'Autobiography,' to read that book, they will forget any grudge they may have formed against the present writer."

George Eliot: A Critical Study of Her Life, Writings, and Philosophy. By George Willis Cooke. Boston: Jas. R. Osgood & Co. 1883.

The Essays of "George Eliot." Complete. Collected and arranged, with an introduction on her "Analysis of Motives," by Nathan Sheppard. (Standard Library.) Funk & Wagnalls.

MR. COOKE'S volume is not, properly speaking, a biography; it is rather a critical essay in which George Eliot's books and career are discussed incidentally. This, at least, is what he declares in his preface, but he has nevertheless gone pretty fully into biographical details. He has in fact undertaken to make his book very thorough, and if he has not succeeded in saying, has certainly made a conscientious attempt to say, what the French call the last word about his subject. While we should be loth to assert that Mr. Cooke endeavored to produce in his reader's mind a disagreeable impression of George Eliot, it is undeniable that he has in a sense done so; and this not merely through his disapproval of the tendency of her philosophical opinions, but by means of half-suggested criticisms upon her character. Thus, while we have a defence of her relations with Mr. Lewes, and a long account of her conjugal devotion to him, this, followed as it is by a very laconic statement of the fact that Mr. Lewes's death was, after an extremely short interval, followed by a second marriage, produces the impression that, after all, the less that is said about George Eliot's matrimonial affairs the better. In the same way, in referring to her casual remark about criticism and critics, that "the floods of nonsense printed in the form of critical opinions seem to me a chief curse of our time, a chief obstacle to true culture," and that the habit of forming "opinions" about books is of doubtful utility, he adds, "It is not to be forgotten, however, that George Eliot had done much critical work before she became a novelist, and that much of it was of a keen and cutting nature"—a reminder chiefly calculated to make us smile with a sense of superiority to such weak inconsistency. Mr. Cooke's statement of the nature of George Eliot's philosophy of life as it is propounded in her writings is fair enough. It was, as he says, altruism, or self-renunciation for the good of humanity. The altruism she got from Christianity; its new object she got from Comte and the positivists. In the Christian scheme, the motive for unselfishness is supposed to be a desire to be at one with God, and to do His will. In hers there is no God, no salvation of the individual soul, no hope of immortality; but the love of humanity takes the place of the love of the Almighty. But this is to the majority of mankind a very unsatisfactory substitute. It makes few converts, and to most people is hardly intelligible or appreciable. What is Humanity, that we should sacrifice ourselves to it? Are we not ourselves, in some cases, as good as the *Être Humain*, and who is to decide between It and us, in case of doubt? All this amounts to saying that George Eliot had no real system of philosophy at all, though she tried all her life to have one. Her discovery that self-renunciation and devotion to others is the secret of the nearest approach to happiness that man can make, is no more novel and startling than that made by Mill, that the direct pursuit of happiness defeats itself.

One great cause of the deep interest excited by her books, however, was undoubtedly the fact that she seemed to be able to reconcile the altruism of Christianity with speculations which led in a very different direction. Her books took a powerful hold upon the conscience of the public, both in England and here, and indeed she was the last of the great novelists who wrote with a distinct moral rather than a literary purpose. She carried the study of character to a point far beyond that reached by any of her predecessors, and towards the end of her career gave herself up to psychological analysis in a way that no other writer, of either sex, had ever done before. Mr. Cooke insists that had George Eliot believed in the immortality of the soul the tone of her novels would have been less sombre, and productive of more lasting good; but this is one of the remarks which give his book at times a tract-like flavor. It is as difficult to imagine George Eliot a believer in the ordinary Christian scheme of salvation as it is to think of Voltaire as an Episcopalian, or Cicero as a Methodist. In dealing with so great a mind as that of George Eliot the important thing is, to abandon at the outset all attempts to measure it by ordinary hard and fast standards.

It is as a novelist and reader of the human heart, not as a philosopher, that the world seems most likely to keep in reverence and preserve the memory of George Eliot. Coming after Dickens and Thackeray, she took their place, and became as interesting a literary figure as either of them. In some respects she was even superior to them. The mine which she worked was apparently inexhaustible. Although her last novels, as literary performances, are inferior to her first—the level of 'Silas Marner' and 'Adam Bede' was indeed one which it was almost impossible to maintain—they were works of nearly as great human interest, and they were works bearing the signature of living and vivid genius. She belonged to that great order of minds which do not fade or shrivel as they grow old, but remain vigorous and growing to the end. Dickens and Thackeray, mighty as they were in their day, ended by producing what were little better than feeble echoes of their earlier books. George Eliot never did this. She had always something new to tell, something original to report, some new problems of character and destiny to analyze.

In the perennial freshness of her mind, and her capacity of giving what, in her somewhat over-worked scientific dialect, would have been called always new and unexpected "reactions," she was a wonder to the last. Minds of this order are rare among men. Almost invariably, the rule is that a genius first delivers his message, and then, parrot-like, repeats it, with ever-decreasing force, till its echo character is detected and held up to ridicule. Only a few men, and still fewer women, appear in a century who are exempt from this law, and appear to have, as long as life lasts, some immortal, intellectual spring which saves them from the wear and tear of time. It is perhaps not unnatural that to some of these the dream of a *Grand Être Humain* should have proved so attractive, for they unconsciously saw in it, as we all must do, the reflection of themselves.

BOOKS OF THE WEEK.

A Day in Athens with Socrates: Translations from the Protagoras and the Republic of Plato. Charles Scribner's Sons. 50 cents.
Adams, W. E. Our American Cousins: being Personal Impressions of the People and Constitutions of the United States. London: Walter Scott.
Ames, D. T. Ames's Compendium of Practical and Ornamental Penmanship. The Author. $5.

NEW YORK, THURSDAY, DECEMBER 27, 1883.

The Week.

SPEAKER CARLISLE'S committees are arranged very nearly as they had been guessed at by the Washington newspaper correspondents. Mr. Morrison is Chairman of the Ways and Means, and his colleagues are divided in such manner, politically and otherwise, that the country need feel no alarm on the subject of the tariff. Apparently Mr. Abram S. Hewitt will have the casting vote on the committee as between the extremists on either side, and it may be added that this responsible position could not be held by one better fitted in the present condition of things to fill it. Mr. Hewitt's views were given at length and with precision during the last session of Congress. His standing as a manufacturer ought to assure the protectionists that their interests will not be wantonly attacked by his vote, while his speeches will satisfy most of those who are classed as revenue reformers. Mr. Morrison was entitled to the Chairmanship upon grounds of long service as well as of familiarity with the business appertaining to the committee. It will be remembered that he was Chairman of the Ways and Means under Speaker Kerr. Mr. Randall is at the head of the Appropriation Committee, and Mr. Tucker leads the Judiciary. The latter is evidently a strong committee in its *personnel*. We regret profoundly that the Banking Committee should have at its head an enemy of the national banking system, and that the Coinage Committee should be under the lead of the author of the Bland bill.

The withdrawal of Mr. Ker from the prosecution of the Star-route cases, and the rumored withdrawal of Mr. Merrick, have started afresh the old charge that there is no sincerity in the Government's course in this matter. John A. Walsh appears as the chief spokesman of this view now, and declares positively that the "prosecution is not honest as a whole, and has not been since the death of President Garfield and the retirement of Mr. MacVeagh." He says there has never been any intention to bring Kellogg to trial, and intimates that he will be allowed to escape in order to secure for the Administration the Louisiana delegation to the next Republican Convention. He charges especial insincerity upon George Bliss, through whose conduct of the cases "all the wealthy mail contractors have escaped altogether, or had their cases referred to arbitrators." It is impossible to say how much truth there is in these charges. Much that Mr. Walsh asserts is clearly unjust to the prosecuting officers of the Government, and is evidently the outcome of bitter personal animosity. While it cannot be denied that the prosecution as a whole is a lamentable failure, and that all the big rogues have escaped justice, it must be said that the ablest and most sincere prosecution possible might not have had any better success, so long as the final decision had to be made by a Washington jury.

The process of expounding the Democratic doctrine of "a tariff for revenue only" is going on steadily in the Democratic papers, and it is very interesting reading. Some of them continue to say that a tariff for revenue only means out-and-out free trade—Cobden Club, British gold, pauper labor, and all. The Nashville *American* takes this view and denounces the great Democratic commentator, Mr. Watterson of the Louisville *Courier-Journal*, as the secret enemy of the Democratic party and, in fact, just as bad as David A. Wells. The *Courier-Journal* accordingly acknowledges that this is "a serious arraignment," and proceeds to explain how the matter stands. This is how it is: In 1856 the Democratic party demanded "progressive free trade." In 1876, it demanded "a tariff for revenue only." After the election the Republicans, in spite of their boast that the tariff for revenue only had defeated Hancock, felt that they could not rest safely on the existing tariff, and got up a Tariff Commission to make a sham revision of the tariff. The Democrats, however, thoroughly exposed them and drove them "speechless" from the Senate chamber. Now the Democrats have come forward again to perform the tariff revision which the Tariff Commission defeated. A further elucidation of the matter has since appeared in the same journal, however, which admits that the phrase "tariff for revenue only" may have "to slide," but it will be succeeded by another phrase meaning the same thing, which is, it appears, that no more revenue shall be collected "than is required to support the Government economically administered." "This is all there is in a tariff for revenue only," and all that the election of Carlisle means.

The New York *Sun* is still, however, as much puzzled as ever, and does not seem to know what will result from the situation. If the anti-protection movement in the Democratic party continues, it says, it will ruin the most available Democratic candidates, such as McDonald, Hendricks, Morrison, Hoadly, and Carlisle, but it says nothing about what its effects will be on the illustrious Holman. There will be nobody then left except Mr. Hewitt and Mr. Flower. But Hewitt is too much committed to free trade, so there remains only Mr. Flower, whom it endorses as a good Protectionist; so good that it apparently thinks he could be elected on a free-trade platform.

A systematic and almost brutal project is being carried out by the Republican Congressmen to squelch Keifer. He supposed that when Mr. Phelps, as the spokesman of the new Congress, withdrew all his objections and asked him to make him a visit and bring his trunk with him, and that when, following this interesting diplomatic manœuvre, the Republican caucus renominated and the Republican members almost unanimously voted for him for Speaker, he had been completely vindicated from the "aspersions of a corrupt and unscrupulous press." He accordingly came to the front promptly as the leader on the Republican side. The first blow came when he offered a resolution for adoption. Mr. Hiscock offered a substitute, and to Keifer's astonishment nearly the whole Republican force voted for the substitute. On Thursday a resolution of inquiry was introduced and referred to the proper committee, designed to ascertain the truth about Keifer's conduct in discharging a competent stenographer at the close of the last session, in order to enable his nephew to draw that stenographer's vacation salary of about $3,000. Some very annoying questions were asked him on this point. Later in the day he took the floor as the advocate of an amendment to the rules appointing a special committee on woman suffrage. When he arose the correspondents vacated the reporters' gallery in a body, and when the vote was taken the resolution was lost simply because Keifer advocated it. All this is deserved, but how much better it would have been for the Republicans if they had spared themselves the necessity for it, by giving him the one adequate and appropriate snub in the beginning—that of refusing him the "empty honor" of a renomination.

The final letter in the Canal correspondence appeared on Friday, but added nothing material to the controversy. As Mr. Frelinghuysen seems to rely greatly on legal doctrines affecting ordinary contracts between man and man, and continually talks about the "consideration" of the Clayton-Bulwer treaty, and the "voidable" character of the agreement owing to a "failure of consideration," we may suggest that there is another legal principle which in an ordinary court of law would be conclusive. Blackstone and Kent long ago showed that there can be no binding contract without a thing to contract about. Now in this case the thing which the parties intended to contract about—the Canal—is wholly non-existent. There is no canal, and consequently there is no contract. If Mr. Blaine had thought of this, how it would have delighted him!

There was some interesting discussion of the Mormon problem at the dinner of the Brooklyn New England Society on Friday. Mr. Beecher, who was the principal speaker, took strong ground against the somewhat popular notion that polygamy can be suppressed by the army and navy, and said, very truly. "that this question, like every other moral question, has got to be treated by moral means, and not by the law of violence. Every man," he added, "that wants to extirpate any form of mistaken belief in politics or religion by law and stricture and force, is a Puritan pure and simple," but he might better have said that

he is a bad politician, who knows little either of human nature or of the history of his race. The speech was all through good reading for those clergymen who are fond of the bayonet as a reformatory implement. The Rev. Dr. Newman, who followed him and apparently represented the other view, whatever that may be, held that the first thing to be done in this matter was to declare that Cannon, the Utah delegate, "had no right to a seat in the Congress of the United States." What the second thing to be done was, he did not clearly state, but as well as we can make out it was "to legislate against polygamy on the ground that it is a fraud, that it defrauds a man of his rights," because "if one man has a right to twenty-five wives, he thereby defrauds twenty-four men out of their natural rights." The way in which this legislation is to suppress polygamy he did not explain, probably by making the Mormons ashamed of themselves. The polygamists would put away their extra wives, we suppose, on learning that they were evidence of fraud towards unmarried men.

The "convict" case which has lately been argued at great length in the Supreme Court of Georgia, has cast grave doubts upon the legal character of the several penitentiary companies who control the convict labor of that State. These companies, having obtained leases of convicts for twenty years from the State, have sought to enjoin the keeper of the penitentiary from delivering to the Marietta and North Georgia Railroad Company a certain number of convicts granted it by legislative acts and resolutions passed after the making of their lease. It was maintained that these acts and resolutions impaired the obligation of the State's contract with the penitentiary companies. It is perfectly clear that if they are private corporations, they can with propriety complain of any legislative interference with their property rights. But it was beyond question proved that the act which sought to incorporate them was unconstitutional, and one of the companies had in effect acknowledged it by having secured a charter from the Superior Court, which alone has power to create such corporations. If these companies, then, are corporations, they are public corporations. As such, it is to be supposed, the Supreme Court of Georgia is anxious to consider them, wishing to uphold a lease pecuniarily advantageous to the State, and yet being unable to do so without confessing that the lessees are mere money-making corporations, to whom has been transferred the police power of the State; for if it holds that they are what Georgia is pleased to have them considered, mere governmental agents, it will be constrained, of course, to decide that contracts with such may be altered and even abrogated at will by the State. This would, indeed, be alarming to the lessees, for there are plain indications in Georgia of a growing desire to resume legislative control of convicts. The lessees cannot be sustained in this action upon the idea that they are partnerships, for the names of no partners are disclosed, as is required in pleading. As the original contractors with the State were forbidden by the Act to transfer their interest in the lease, such a disclosure might, it is thought, prove fatal to them, by showing that there had been a departure from its terms. As private corporations they have no legal existence. As public corporations they have no cause of complaint. It is difficult to say what character the Court will give them, for it is well known that, though presumed to be governmental agents, they have the odd features of stockholders. It is not improbable that every difficulty may be escaped by calling them quasi-public corporations.

The Boston Civil-Service Reform Association have called Mr. Long and Mr. Ranney to account for voting for Mr. Keifer for the Speakership, by asking them for what reason consistent with their avowed support of civil-service reform, they voted for him. They both answer that they had no idea that the issue of civil-service reform was in any way involved in the contest. Both say, too, that they understood that Mr. Keifer had rendered important aid in passing the Civil-Service Reform Act. He may have done so, but they apparently forgot his own performances as a civil-service reformer in his dealings with the House stenographers.

The *Financial Chronicle* has an important article on "Government Land Sales," showing the amount of public lands disposed of during the past six years in the several States and Territories, as indicating the direction in which population is moving. The total number of acres disposed of in the year 1883 was 16,830,455. The table of largest sales, in the order of magnitude, is as follows:

	Acres.		Acres.
Dakota	6,689,595	Mississippi	516,511
Nebraska	1,315,104	Oregon	491,770
Minnesota	1,292,969	Louisiana	487,599
Kansas	808,655	Arkansas	460,656
Washington T'y.	763,779	Wisconsin	454,003
California	704,274	Florida	434,749

Texas is not embraced in the list, as the United States have no public lands in that State. The list includes lands sold for cash, and taken under the Homestead and Timber Culture Acts. The sales for six years have been as follows:

	Acres.		Acres.
1878	6,855,781	1881	8,379,518
1879	8,649,259	1882	12,526,262
1880	9,090,495	1883	16,830,455

The increase of sales during the past two years has been very marked, being at the rate of 50 per cent. in 1882 over 1881, and 40 per cent. in 1883 over 1882. This extraordinary addition to the producing power of the nation, the *Chronicle* argues, must soon tell favorably on the existing business depression, for although the opening of new territory cannot be expected to show full results in the first or even the second year after settlement, "yet when it is remembered that during the two years since the depression set in, more than twenty-nine and a quarter millions of Government acres have been entered upon, it will readily be seen what a wonderful recuperative power this continued opening of new territory offers."

As the new year and the meeting of the Legislature approach, the railroads are no doubt getting their free passes ready and preparing to correspond with members on the subject. Politicians have recently discovered a way of making a little reform capital out of this effort to corrupt them by spurning the offer of a pass in the press, publishing the "tender," and also the scornful refusal with which it is met. Such correspondence is instructive as far as it goes, but in the case of legislators of good reputation it it is unnecessary, as they are not suspected, while suspected members are not cleared of suspicion, even by the most thorough advertisement of their little spurn. The only way to let the public fully behind the scenes, as we have suggested before now, is to make the companies publish a dead-head list every year, after the adjournment. A comparison of votes with rides enjoyed would probably throw a flood of light on the winter's work.

The hanging of O'Donnell has led to a meeting in Washington in which two or three Congressmen paid their tribute to the Irish vote. Mr. Robinson, of New York, demanded the recall of Lord J. Russell Lowell, Mr. Calkins, of Indiana, maintained that O'Donnell had been illegally convicted, and Mr. Finnerty declared that the President ought to have demanded the respite of O'Donnell for ninety days, and, in default of it, have suspended the diplomatic relations. He predicted that if, in consequence of this stern course, England had sent her fleet out here, she would have got the worst of it, as in the war of 1812. Mr. Belford, of Colorado, maintained the right of every man to kill a "sneak," and declared that had O'Donnell been tried in Colorado he would have been promptly acquitted. The bitterest rebuke, however, called forth by O'Donnell's execution, is the formal resignation by Mr. John Joseph Ryan of his American citizenship, and the return by him of his naturalization papers to the judges of the Court of Common Pleas. He scorns to be any longer the citizen of a republic which allows American citizens to be hanged abroad when they commit murder, or allows them to be imprisoned when they blow buildings up, under sentences which have not been approved by Irishmen in this country.

The movement for the protection of American labor against foreign emigration seems to be spreading. According to a despatch from Pennsylvania, the miners in the Connellsville coke regions have determined that "the Hungarians must go." If it were not for the anti-Chinese law and the well-known feeling in this city about the cheap Italian laborer, we should have taken the anti-Hungarian movement to be a joke of some free-trader. The complaint against them is that they are crowding out the local Pennsylvanians, who we presume are of Irish extraction, that they are "filthy in their habits, living on what Americans could not eat," that they are very immoral, and "unscrupulous," and ignorant, and also that they "will not become naturalized citizens," and cause a general loss of time and labor in attempts to elevate them in the social scale. Therefore they must go. After all, is this a "crusade," or is it a joke?

Interesting and edifying information about Mr. Blaine continues to accumulate. A correspondent of one of his most devoted organs visited him in his "workshop" in Washington a day or two ago, and found him at a "great big table" loaded with manuscript, proofs, and documents. The "great statesman seemed to be engaged in revising some proof-sheets of his book," and was not overjoyed to be interrupted. He was polite, however, and was gracious enough to say that "he was in love with his present work, and should hereafter follow the pursuit of writing. Nothing he had ever done was so in harmony with his tastes, and he was never so contented and happy." Another correspondent has been examining the State of Maine on the subject of Blaine as a Presidential candidate, and has found a great cooling off in enthusiasm for him there. He has also discovered that Blaine does not expect to be nominated next year; that he looks forward to 1888, and intends in the meantime to complete his "history," which "will be his monument." His chief aspiration outside of the monument is to be Secretary of State under the next President, in order to give the American Jingo policy that fair trial which he does not believe it has yet had.

The Hebron clergyman who, in the guise of a powerful sermon on "Polygamy," made a rattling attack upon one of his church members who had recently married a fourth wife, is in danger of losing his position. It will be remembered that the situation in which the assailed man was placed was an extremely trying one. His divorced third wife was present in the church when the sermon was preached, and was seated where she could fix her eyes upon the victim and see how he stood the attack. He was naturally much displeased by the occurrence, but, after calling the pastor a "liar and a hypocrite," he sold his house and left the town, leaving the pastor apparently master of the field. This retreat was, it seems now, a mere ruse on the part of the polygamous member. He took up his abode in a neighboring town, and began operations for undermining the minister. He has succeeded so well that it is now believed in Hebron that the minister will have to "go." All the people of the community who have been divorced, and all those who hope to be, have joined forces against him. The prevailing feeling among them is that the present tendency of the rural pulpit to descend to personalities must be checked by a decisive rebuke of some sort.

The business of drawing pen-photographs or paragraph portraits of eminent authors, statesmen, dry-goods men, monopolists, primadonnas, tenors, and poets, for the press is now well established, but the vocabulary of these word-pictures is hardly as definite and exact as it might be made. We have before us a column and a half of such sketches, recently published in an esteemed Boston contemporary, admirable in their way, but in which the description would hardly enable the reader to identify the person described on a casual meeting. For instance, we find a lady described as "medium-complexioned," "pleasant-featured, comfortable-looking," and "middle aged." Another is put down as "a magnificent blonde of generous proportions, with charming eyes of a hazel cast." A good deal of pains seems to be taken, in the case of men, to make the description hinge upon the way of wearing the beard, though sometimes without much result; *e.g.*, ——'s "gray hair and side whiskers are sometimes allowed to grow as they please, free from the pruning of the tonsorial shears," and this is followed by the extraordinary statement that "his ears are not always observable on account of this capillary growth." The remarkable thing about the descriptions is that so many of them refer to a "medium" or average, assumed to be generally known, the persons described being characterized by their approach to or departure from a medium stature, a medium height, or a medium complexion. Work of this sort, when really good, is always anonymous, but the sex of the writer may generally be made out. It is an unfailing mark of the masculine pen-photographer that he dwells with interest upon the weight of the person described, while the lady personnellist, if we may call her so, usually makes more of age and dress, particularly in the case of her own sex. Thus, in the list before us, one lady is put down as "very fond of dress, . . . not invariably suited to her advancing years." A woman is apt to be a good judge of such matters as these, but how the men in the business get at the weight of their subjects it is hard to conjecture.

A novel method of forging a will has come to light in England in the case of Priestman against Thomas. A gentleman named Whalley died, leaving a will written, as many wills are, on white paper, by which he bequeathed a property of $300,000 to his attendant, Thomas, an ex-railway porter. This was a great surprise to Mr. Priestman, a natural son of the testator's, who had good reason to expect the property himself; but everything appeared to be regular, and Thomas compromised by taking $85,000. This large sum of money so turned Thomas's head, that he waved a piece of blue paper at Mr. Priestman as the latter drove by his window. For some reason Mr. Priestman jumped at the conclusion that this piece of paper was the missing will in his own favor. The result was a lawsuit in which it appeared that the only genuine part of the "white" will was the signature. Whalley had been induced by Thomas to dictate a letter in pencil on a sheet of white paper to Priestman, but had signed it in ink. Thomas had then rubbed out the pencil marks, written in a will, and got some friends to witness it. The pencil marks were rubbed out with bread crumbs, but, as the event proved, this was a bad plan. The effect of rubbing pencil marks out by such means is not to destroy them altogether, but to raise the fibres of the paper so as to cover them. After a time they get smoothed down, and then the concealed marks come to light again. This, at least, is the testimony of Mr. Holmes, the Queen's librarian, in the case, and the reappearance of the old marks in the "white" will corroborated what he said.

The disorders often produced in court-rooms nowadays, by the replies of the prisoner to the question whether he has anything to say why judgment should not be passed upon him, have led to some inquiry into the reason for the practice. There is little doubt that it was originally asked before prisoners were allowed counsel, to enable them to move in arrest of judgment. As all such matters are now in the hands of counsel, the opportunity given to the prisoner does not seem to help him in any way, but it enables him, if he has a mind for it, to make an inflammatory stump-speech on the infamous way in which he is being persecuted, which is sure to find a prominent place in all the papers next morning, leaving matters at issue, however, exactly where they were before. On the conviction of Poole, for instance, for the murder of Kenny in Dublin, the prisoner, being called upon in this way, appears to have made some remarks in glorification of murder in general, or at any rate of murder as practised by him, and wound up with proposing three cheers for the Irish Republic. It would seem to be a simple matter to get rid of this abuse by requiring the judge to address his question to the prisoner's counsel instead of the prisoner. There is no hardship in this, as it merely places the conduct of this part of the defence in the hands which control all the rest of it.

The capture of Sontay by the French with trifling loss is not a great military exploit, but it is undoubtedly for the French Ministry a great political exploit. It enables them to take a bold front in the Chambers and show something for the large votes of money which they have been recently demanding, and which have begun to alarm the public seriously. The capture of Bacninh will probably soon follow, but the political troubles will not then be over. It remains to be seen what the occupation of a new territory will cost, and what China is going to do in the matter. Admiral Courbet apparently does not know whether the Chinese regulars really took part in the defence of Sontay or not, for it was evacuated during the night.

The latest report of the disaster to the Egyptian troops, near Suakim, given by an officer who was present, shows that it was by no means such an awful affair as has been represented. There were over 450 regulars in the party, besides sixty bashi-bazouks, and they had two field-pieces and a mortar. The only enemy they saw was about 150 Arabs armed with swords and spears, and some with big sticks only, whom they at first kept at a distance with the field-pieces. But after a while they formed a square, and the square was actually broken by thirty men, whereupon those who were not killed took to their heels, the Pasha in command close behind them, and never stopped till they reached the sea. The British Consul, Commander Moncrieff, stayed behind and showed fight and was killed. But the bulk of the party seem to be alive and well, but with their confidence in the square as a military device much shaken.

HOW THE REFORM IS WORKING.

SOME of the Civil-Service Reform Associations have begun to take testimony with regard to the practical working of the act, and more particularly with regard to its effect in relieving members of Congress from the pursuit of office-seekers. The New Haven Association has received answers to its questions from Messrs. Hawley, Edmunds, Kasson, and Platt, all four conspicuous men, who are likely to observe the working of the law without any special bias either way. Mr. Hawley says "emphatically" that it has relieved him from the pressure of office-seekers, and it is securing the end for which it was enacted. Mr. Edmunds says that it has not done him much good in the way of relief, for the simple reason that seven years ago he relieved himself by declining absolutely to make any recommendations or requests on anybody's behalf. The only fault he has to find with the act is that it is not stringent enough, and that the President may break through it whenever he pleases. Mr. Kasson, who is a convert of the eleventh hour, bears much the same testimony. He says members of Congress are relieved from pressure with regard to all those offices which are covered by the act, and that its effect with regard to offices which it does not cover has undoubtedly been to diminish the eagerness and zeal with which applicants pursue them; but he doubts whether the law is improving the *personnel* and efficiency of the service, or rather says the question is "involved in doubt," without saying whose doubt. Senator Platt of Connecticut says that Connecticut Congressmen were troubled less than most others by office-seekers even before the act was passed, and that they are now not troubled at all by applicants for clerical offices, but he is as much troubled as ever by applications for his "influence" in the matter of promotion, and it seems to him that it would be peculiarly appropriate that the right to promotion, as well as fitness for an original appointment, should be determined by competitive examination, and he will be glad to see the operation of the act extending just as fast and far as it is practicable. On the other hand, the testimony of the Democratic Senators, although it has not been published in detail, is said to be very unfavorable. They have apparently experienced no relief from pressure whatever. If they are subjected to pressure, however, it is undoubtedly due to the fact that they are expected to disregard or overturn the law at the earliest possible moment. There has been no indication at any Democratic meeting or convention of any general acceptance of the law by the party, or of any intention of enforcing it, or allowing it to be enforced, one minute longer than can be helped. The orthodox party doctrine, in fact, seems to be that the whole thing is a piece of Republican humbug, intended for the sole purpose of enabling the party to retain possession of the offices after having gone into opposition.

Mr. Platt's suggestion with regard to the use of competitive examinations, for the purpose of promotion, touches on what is probably one of the most serious difficulties in the practical working of the reform. There are certain fields in some of the departments—that of the Interior, for instance—in which the main element in the excellence of an employee lies in his special knowledge, and in which other qualifications count for comparatively little. In such fields a man's comparative fitness for a higher place can probably in most cases be ascertained by competitive examination with almost complete accuracy. But in most others to make promotion dependent altogether upon his ability to answer written questions better than rival candidates would strike a very serious blow at the responsibility which must be lodged in the hands of every head of the department. The chief of any office or establishment who does not know better than anybody else the relative value of his subordinates in almost all cases, is not fit for his place. As long as he retains it he must be assumed to know better, or he cannot be held with any fairness accountable for the way in which the work is done. The difficulty of fixing responsibility on the right person is the weak point in the whole American system of administration. The tendency of all changes in the nature of administrative reform for some years back in all the States has been in the direction of making this responsibility more clear and distinct, or, in other words, in the direction of making it easier for the voter to say, when things go wrong, who is to blame. If it should turn out that there was anything in the working of the Civil-Service Reform Act to hinder or divert this tendency, it would be unfortunate, both for civil-service reform itself and for the Government of the country. If the day should ever come when high officials would be able to say that shortcomings in their office were due to the unfitness of persons forced upon them for responsible positions by the new law, it would go far to condemn it utterly, and to commence a reaction which might carry us back irretrievably to the spoils system. It is in this matter emphatically better to rely upon the gradual dying out of the whole system of Congressional "influence" through the general discouragement given to it by the working of the act, aided by the increasing power of the resistance of Congressmen themselves, than to make any addition to the law which would be likely to interfere with the proper discipline and control of persons already in office. It is not at all likely that Congressional pressure about promotion will last very long after it has ceased to be of any use in procuring entrance to the service.

The addition to or extension of the act which we now need, is the repeal of the four years' limitation which the law of 1820 now places upon the tenure of offices not covered by the Pendleton bill. The mischief which this works has often been pointed out. There is probably no way in which it works so much mischief as in keeping alive the spirit or state of mind among office-seekers which made the Civil-Service Reform Act necessary, and which, in fact, created the spoils system. The reform will never be complete as long as there is a large body of persons of all ages in the country who are constantly thinking of the Government service as a means either of repairing broken fortunes, or escaping the sharp competition of ordinary business. It is this class which pesters Congressmen and makes politics corrupt, and it will not disappear until the whole service, as well as the clerical offices, is practically put out of their reach. We do not mean by this to say that places not now covered by the Pendleton bill, and held under the four years' tenure, should be thrown open to competitive examination, but simply that they should be held during good behavior, so that it should not be known to any one but the appointing power when a vacancy would occur, and that vacancies should not be made except for reasonable cause. As long as the whole country knows when an officer is to be turned out, there will be hundreds of persons kept from betaking themselves to some honest industry by the expectation that they can intrigue themselves into his place. It is right to add that those who advocate the repeal of the four years' tenure do not mean, as some have believed or tried to believe, any extension of tenure in the offices now covered by the Pendleton bill, but in those with which the Pendleton bill has nothing to do, and in which appointments are not made through competitive examination.

THE VOTING POWER OF STOCK.

SOME attention has been drawn recently in England to a plan for protecting the rights of minority stockholders in corporations, by doing away with the old rule which gives one vote for every share of stock. It is this which enables a single stockholder, by getting a majority of the stock into his hands, to outvote the whole host of little stockholders, and "run" the concern as he pleases. Formerly it was supposed that no harm could result from the majority principle, because the interest of the majority and minority would after all be only the interest of the corporation. But this, although true enough in the case of ordinary business concerns like a factory or an insurance company, does not seem borne out by the facts when we get into the region of the corporations whose stock is daily bought and sold in Wall Street, like railroads and mines. In these we frequently see a powerful operator get possession of a majority of the stock for the purpose of furthering some private scheme of his own, and it is possible for the great speculators by such means as this to ruin the minority interest, under guise of managing their property for them. In the Elevated Railway case now going on in this city, for instance, it is supposed that Jay Gould first depressed the stock in one of the companies, by a "bear" raid, helped by legal proceedings which he set on foot, then bought up the stock at low figures, and then, through the Board of Directors, made contracts with the other companies which he also controlled, the result being his own pecuniary advantage and the great injury of minority stockholders. According to testimony taken or offered in this litigation, notice in advance of an intention to "crack" the company was privately given.

Without going into the merits of these accusations, however, the precise truth of which will probably never come out, it is enough that operations which fall far short of a conspiracy to "crack" a company, and which are usually regarded as legitimate, may result in serious sacrifices of the minority's rights. The mere fact that one man can get possession and control and management of the entire property belonging, it may be, to a thousand small stockholders, and to a very great extent do what he pleases with it, is a serious matter, and this is what has recently happened in the case of a great English corporation, the Hudson's Bay Company; and something very like it always happens, unless the public is greatly mistaken, whenever a new railroad passes into the hands of the Brown, the Jones, or the Robinson "party." In England, attempts have been made, by a very simple device, to increase the power of the minority by limiting the voting power of stock. Thus, in the case of one railway, the London and Northwestern, every $500 of the stock gives one vote, up to $5,000; after that the voting unit is $2,500 up to $50,000; then one vote for every $5,000 beyond. In the London and Westminster Bank, a holder of ten shares has one vote, but a holder of fifty has only two.

The equality plan in stock elections evidently rests upon the idea of identity of interest, and is inherited from a time when most of the extraordinary phenomena of modern corporate life were undreamt of. The old idea of a corporation was a concern which would need for its creation and development an aggregation of capital contributed in small amounts by several people, and it seemed only proper that the amount of voting power should be exactly proportioned to the amount of money subscribed. But most of the money-kings and monopolists of our day do not get their immense wealth through corporations of this sort. In a large proportion of cases, the money contributed is represented by bonds, which have no voting power, while the stock represents nothing more than the probability of profit after the encumbrances have been provided for. Stock in this condition is the natural football of speculation, and of that sort of speculation which leads to all kinds of frauds and irregularities, as no one who recollects the history of the Erie, the Hartford and Erie, or the Crédit-Mobilier disclosures will question.

In the case of corporations already chartered in this country without restriction of any kind, it is, to say the least, doubtful whether the Legislature could interfere with the voting power of stock. The right to cast a vote for each share is a valuable property right under the charter, and a change in it designed to give small stockholders greater power, would be met with determined resistance in the courts. But the right to alter and amend corporate charters is now generally reserved by the Legislature, and whenever this is the case there can hardly be any legal objection to the change, for it would be in the interest of the good management of the concern. In the case of new corporations there is nothing to prevent the Legislature from making any rule as to the relation between votes and stock that it thinks expedient, and that the corporation will submit to.

But undoubtedly the phenomenon of the capture of corporations by the money-kings for private purposes, which we so constantly witness, is due in great measure to the fact that there are always so many thousands of millions of stock on the market which represent, not the money actually expended in the development of the property, but the chances of its yielding great profits in the future, owing to the extraordinary growth of the country. As the expansion of the country slackens, and corporate golcondas become impossible, and the rate of progress becomes steady, instead of consisting of leaps and bounds alternating with dead stand-stills, stock will more and more represent invested capital; and, as every one knows, regular dividend-paying stocks are not those out of which money-kings are generated. But even then it will be very questionable whether there is any sense or reason in giving every share a vote. The idea of one man being able to outvote forty in the management of the joint property, merely because he owns more of it, rests on a false idea of equality, and seems essentially undemocratic, as it makes numbers even when united powerless, and leaves the management of the joint interests to be determined by the brute power of wealth.

ART UNIONS.

The experiment is about to be tried again in New York of hot-bedding art. The exhibition which opened to a private view on Wednesday week is the first display of an institution which differs somewhat from any of which we have had experience, being organized and conducted entirely by artists. We who remember the old Art Union and its disastrous effects on the interests of art in general, may be pardoned a doubt as to the desirability of a repetition of the experiment. We may be sure that in the hands of the experienced artists who compose the "Board of Control," there will be as good taste in the selection of prizes as in the direction of the illustrated monthly journal which forms an unexceptionable part of the programme. But artists are notoriously bad business men, and it is in the working out of their plans that the hitch is generally found. The elder extinct institution was conducted entirely by business men, and financially was a great success. If its influence on art was adverse, it was probably due to the fact that those good business men imagined that the laws of trade, which they never would have lost sight of in reference to coffee or cotton, had nothing to do with pictures, and the new claimant for the old title does not show indications in the programme of having clearly in view the blunders of its predecessor.

An "Art Union" means to the ordinary apprehension a lottery of works of art drawn by the subscribers to the funds of the institution; and the "American Art Union," while it does not hold this as the peculiar object of its formation, allows it to be implied as an outcome of the organization. Now, a permanent lottery, in no matter what, means: firstly, the derangement of the laws of supply and demand; secondly, the lowering of prices as both direct and indirect consequences of the pushing of more articles on the market than there is a healthy demand for; and thirdly, the stimulation of the tendency of the young possible artists to adopt art as a livelihood beyond the point to which the taste and means of our community will sustain them in normal ways and times. Works of art follow the same law of the relation of supply and demand that rules the price of diamonds and potatoes; and when by means of a lottery a larger number of pictures are pushed on the market than the community wants, the price falls just as certainly as does that of diamonds in similar cases. And this is brought about by the operation of three distinct agencies: firstly, men will not buy pictures when they think that they can get them for the price of a lottery ticket; secondly, they value a work pretty much according to the price they paid for it; and thirdly (as we know from the workings of the old Art Union), the pictures drawn are rarely to the taste of those who draw them, and, being thrown on the market again at auction sales, are sold sometimes for a fraction of the price the artist received for them, with the inevitable result of knocking down the prices of all the artist's unsold works. To foster art we must sometimes discourage the artist. Healthy pruning and cutting out the weaker growth is good for forests and for art—both natural growths, and not to be stimulated by any artificial process. If art is to become a feature of American life, it can only be so by cultivation under the laws which control industrial activity in any other branch, and that means a growth in response to a genuine and healthy demand, as opposed to any system of encouragement which induces men to take pictures that they do not want, or to regard them as objects of speculation. The picture dealer and the art lottery are the chief enemies of art, and all the more dangerous as they appear in the beginning as the great friends of the artist.

The new Art Union, however, is not out of grace yet, and there is a direction for its operations in which we can see no danger of shipwreck, and which is, indeed, indicated in its programme as a possibility where it ought to be placed as a finality—*i. e.*, the formation, from the prizes, of local art-galleries. This will have the double good effect of putting out of the market the works of art drawn, and therefore out of the danger of influencing prices; and of developing a taste for art in those localities so favored, and conducing to private patronage on a healthy basis. Any other of the various plans indicated by the programme published by the American Art Union will certainly be disastrous to art, whatever may be its momentary effect on the individual artist. If the subscribers should, by the general vote provided for in the programme, decide to distribute the pictures, etc., by a lottery among themselves, the public morality, which imperiously militates against lotteries of any kind, and the interests of art alike, would demand the rigorous application of the legal remedies already provided, to the new institution as they were applied to the old.

A SOUTHERN "EXPERIENCE MEETING."

MADISON, Wisconsin, December 12.

A FITTING close to the volume of suggestions afforded by the recent meetings of the National Conference of Charities and Corrections at Louisville, was my visit to a seminary for colored girls and women at Atlanta, Ga. While under the control of the Baptist Home Mission Society, it owes its existence to two Boston women who, about eighteen months ago, went South with benevolent purpose. At first they gathered around them a few colored pupils in the basement of a church. The contagion of ambitious hopes soon spread itself not only among scores of Atlanta freedwomen, but far beyond the limits of that city. To-day there are nearly three hundred scholars availing themselves of the educational privileges offered, and young girls are flocking thither from many different places in the South. The old United States barracks are now used instead of the small church basement, which soon proved inadequate. The cottages of the row once occupied by army officers are now connected by a long covered piazza, and each is a cosy dormitory under the charge of one of the seven lady teachers at the present time employed. The large, beautifully located building, formerly known as a hospital, has been converted into a chapel with adjoining recitation rooms.

The ages of the scholars now in attendance range from eight to fifty years. The school was to me one of the most interesting and thought-awakening institutions I ever visited. Pitiful indeed is the mental and moral condition of the colored people of the South to-day. More especially deplorable seems the profound moral as well as mental ignorance of the female population, for it is one of the strongest barriers to successful efforts for the elevation of the colored race. According to the last census there are nearly six millions of negroes in "the South"; nearly a million and a half of the colored children are girls, prospective wives and mothers of millions of future voters, who, unless properly trained, can but perpetuate degradation and greatly aggravate national immorality. Is there, at the present time, any field for the home missionaries where woman's influence and peculiar tact are more needed, than among her ignorant and naturally depraved colored sisters in the South? The work required in this field is, in fact, such as only *women* can perform.

The preceding statements have been used for a background to numerous illustrations of the needs of our colored girls and women as they were revealed to me at an "experience meeting" which I attended while among them. Unlike our white scholars—whose natural timidity or self-consciousness prevents them from speaking even a carefully committed "piece," and much more seriously from expressing their own convictions without the most painful embarrassment—those colored girls were eager and anxious to rise in their seats and give utterance to their inmost thoughts. The hour devoted to vacation "experiences" was, for them, alas, too brief. Those who had to wait for their turn until the next Friday were very solemn in their necessarily enforced silence. As I con the leaves of my little note-book, which I used freely that morning, feeling that the recitals were too valuable to be forgotten in the many distractions of travel in the suggestive South, I see again the faces of those three hundred colored girls and women, and once more hear their plaintive voices. After singing a number both of plantation and gospel songs, among which were "I heard a voice, I couldn't tell where," and "Child of sia and sorrow," they began their remarks and narratives. From the many "experiences" in my collection, I submit the following specimens—all based upon fact, and culled from as faithful a record as my swift pencil could make:

Number 1. "I's been a workin' fur Jesus all de summer vacation. I don't ask fur no better times dan I has in dis yeah school where we all come to learn to work fur Jesus"; and number 1, a tall, gaunt girl, who seemed to be made up of knuckles, elbows, and faded pink ribbons, raised her voice to a high pitch and sang, "Never be afraid to work for Jesus," the whole school joining in the chorus.

Number 2. "I's been a workin' fur Jesus too. I's ben teachin' forty-five miles from yeah, an' I had twenty-seven scholars, most of 'em older than me, but they didn't know anythin' till I tole 'em all 'bout Jesus. They wanted to study 'rithmetic and geography—to please Jesus; an' dey was so glad I come back yeah to learn more 'bout him. I was so sad and so sorry kase I didn't know how to count furder. Jes' as we'd get on a piece, I'd have to stop. Oh, I was so 'shamed, I cried sometimes all night kase I couldn't help 'em more 'bout Jesus." And she sat down with eyes full of tears, because of her realization of the fact that she knew but little about Jesus—her synonym for the common English branches.

Number 3. "Dis chile didn't do no teachin' in vacation," said a big mulatto woman, with great pomposity. "'Twan't cos she didn't know nuff 'xactly, nor cos there wan't heaps dat needed to be teached. On every side iggorant niggers is as thick as flies. But my *preferment* was doin' suthin' else fur my blessed Saviour. Needn't think I didn't work for Jesus, my young sisters. I tell ye I worked mighty hard! I visted heaps o' sick niggers, an' I 'low I wan't lazy. Don't win ye no crown jes to go an' *look* at sick folks, unless ye *do* suthin fur um. I feel like as if my stomach was light and freed from bile, cos I nussed the sick, an' puttin my shoulders to the wheel, didn't look back like Lot's wife an' turn unto a pillow of salt, but minded my blessed Lord an' Saviour an' visited the sick—fur to please Jesus. I likes dis yeah school. Laws! I's mo'n fifty years ole or thar-'bouts, an' till I kum yeah I nebber know'd dat workin' fur Christ meant nussin' sick folks an' goin to see the widowers an' childless in affliction, an' keepin' unspotted from de world."

Number 4. "My bredren and sisters," began a young girl (and as there were no "bredren" present of course the school indulged in laughter, but she was not intimidated), "I've tried hard all de vacation to be a light to sinners. I'm proud, in meekness, to say dat I've converted twenty souls to Christ. Since I'se learned to read in dis yeah school I feel like as ef de Bible is so sprinkled in my soul dat I can't stan' roun' doin nothin': I must nudge all dem as sits in darkness. I tole many ob my friends 'bout de Atlanta Female Seminary fur girls, an' dey want to come yeah too, an' I see six of 'em yeah now. Dey'll werry soon learn how to count an' read, kase dey has gib dere souls to Jesus. I hope an' pray dat dese yeah white ladies from de Norf (yeah jes' to teach us cullud girls), will feel like as ef we had all done our duty in vacation an' come back to dis yeah place with our dues to Jesus all paid up." The room was perfectly quiet for several moments, but suddenly a sweet young voice led off and all joined in singing, "Jesus keep me near the Stream."

Number 5. "I's a stranger in dis school. I was nebber here before. But de Lord helped me to git introduced to Pinkie Starks, she dat's jes' been speakin', an' my ideas is open. I race to git yeah. I long fur to know as much as she does. I long fur to please Jesus, an' I pray fur an education so dat I kin read my Bible. Seems like as if I'd read it day and night when I once find out how to git acquainted wid my Lord and Saviour. Dat's what I's missed so much, young's I be, not knowin' how to read my Bible an' be a light to sinners like Pinkie Starks." She started the tune, "I'm in a strange land far from home," but only a few were familiar with the words, and most of the song was feelingly carried on alone.

Number 6. "I's been teachin' down in Florida, 'way down in de country. But oh, I knowed sich little! I could n' only count up to five, and there I had to stop an' think an' think what should I do? Oh, I was so 'shamed! I had twenty-five scholars. They was all poor, but it made um happy to hear 'bout Jesus. I showed um how to count and read. Oh, I tell you they was mighty proud! If you could only of seen me in the ole tumble-down meetin'-house tryin' fur to help my bredren and sisters in the Lord, you'd of laughed, I know. Fur I hadn't nothin' to teach with—none of the *inconveniences* that we have yeah: I had nothin' in my hands or head to boast of, but I had heaps *yeah*," laying her big black hand on her heart. "I *consorted* to all the means in my power. I made a blackboard out of a piece of dry-goods box, an' I blacked it with chimney-soot. One of my scholars brought me some vinegar to set the soot. It didn't work very well. Afterwards a boy got some shoe-blackin' fur me. I pounded on an ole tin pan to call the scholars together. Oh, how I longed to hear the sound of the little bell at this school! The colored folks in a city like Atlanta don't begin to know what 'tis for dem poor darkies to live way off in the country, so fur from any churches or schools, an' oh, so awfully poor. When they git money to spend anywheres they're cheated. They don't know anythin', 'specially how to count money. They is hundreds of um jes' dyin' and wastin' away all the days, 'kase they can't get to learn 'bout Jesus."

At this period a certain white lady in the room requested the school to favor her with the popular melody "Golden Slippers." After a long and somewhat ominous silence, a girl in the rear of the large chapel slowly arose and said: "You'll have to excuse us from singing dat song 'bout 'Golden Slippers.' *We don't consider dat very religious.*"

The "experience" of Sophronia Heard, who told us that she had learned how to *carry* herself, and instead of yielding to the influence of a certain "sinner-man," named Smith, had "converted" him during vacation; that of Indiana Turner, who had mastered the multiplication table, and was as pretty, interesting, and lady-like a young woman as one would care to meet anywhere; that of Missouri King, whose superstitious notions were a source of perpetual amazement to herself and pitiful amusement to the more enlightened; and, last but not least, the personal and private reminiscences of Miss Bug, who, after a really sad recital, plaintively sang—

"Don't be like de foolish vergens when dey came, when dey came,

"For dey had to go and *borry* when dey came,', etc., etc., and then led in the depressingly hopeful chorus, in which the whole school joined:

"What can wash away my sins?

"Nothing but the blood of Jesus"—

all combined to show how great, and indeed how imperative, is the call for missionary work among the colored girls and women of the South.

STATE AND LOCAL TAXATION.

To the Editor of The Nation:

Sir: It would be well if Mr. Blaine's letter as to the disposition of the Federal excise tax upon liquors should lead to a reform or a revolution of the present methods of State and local taxation. They are very onerous. Although direct, they do not meet the economic conditions of direct taxation. They violate at least three of Adam Smith's four canons. They are not uniform, nor do they promote the economy and vigilance in public expenditure which the economists claim attend direct taxation. Every taxpayer in your city and State will doubtless grant that. If there is a surplus Federal revenue, reduce the taxation that produces it. That is a plain case. There is no surplus revenue so long as there is a national debt and interest charge. There is, I believe, no proposition made by any free-trader for any tariff system that would not yield enough from customs to pay the expenses of the national government economically conducted. So there is no need to take alarm at Mr. Blaine's suggestion as though it were a plan to bolster up protection, or to maintain the collection of a surplus revenue by distributing it among the States.

The American people now raise easily from a tax on liquors, cigars, tobacco, etc., one hundred and forty-five millions of dollars a year for their Federal needs, and onerously, by a so-called direct tax, about an equal amount for their State and county needs. Does not the ease of the one method and the burdensomeness of the other suggest that the former method can be well and wisely put in place of the latter now, or when the former is no longer needed by the people for Federal purposes? I ask your aid to bring this—the only material phase of the subject in my opinion—before public attention, because you and your correspondent, Mr. Bourne, are chiefly insistent on that view which makes the proposed plan a distribution of surplus Federal revenue among the States. It thus becomes, and I think wrongly, a present and revived form of the plans to distribute the proceeds of the public lands and then of the treasury surplus which unprofitably occupied and perplexed the attention of Congress and the country from the administration of the younger Adams to that of Tyler. The American people should be as willing to use Federal as State or local methods of doing anything if the former are the best. If Federal methods are the best for maintaining an excise tax on liquors, cigars, tobacco, etc., for State and local purposes, those methods should be adopted, and the officials of the system should be elected by the people in the respective districts. Every Federal official should be elected save the judges. A local election of officials would obviate all dangers of centralization from this method of collecting a revenue.

Sam. M. Clark.

Keokuk, Iowa, Dec. 17, 1883.

POLITICAL ALGEBRA.

To the Editor of The Nation:

Sir: The Administration has recommended a policy which indicates the dictation of Wall Street bankers and the complete ignoring of the "exploded heresy" known as "the Ohio idea." As a citizen of Ohio I would like to ask whether this new policy does not bear the marks of a *reactionary* spirit.

The Comptroller of the Currency, after showing that 4 per cents have risen until it barely pays national banks to retain their charters, proposes to repeal the tax on circulation and allow a circulation of 90 per cent. on the *market* value of the bonds. Here we have a system which *regulates* the amount of currency by a *fluctuating* standard, and *insures contraction* as the market value of the bonds descends to par. This same system has the still worse feature of converting the Government into a stock-exchange bull. It is impossible that money invested in 4 per cents should pay better than money invested elsewhere. If these bonds could remain at 121 the national banks would be enabled by the Comptroller's proposition to realize a bonus of $2,023 per annum instead of $46. This is shown by the following table:

Given $100,000 of 4 per cent. bonds having 23½ years to run—

Annual interest		$4,000
Cir. 90 per cent. on market value	$108,900	
Deduct 5 per cent. redemp. fund	5,445	
	$103,455	
$103,455 loaned at 6 per cent.		6,207
Total receipts		$10,207
Deduct cost of redemption	$ 30	
" 1.23½ of premium	894	
		$924
Net receipts		$9,283
$121,000 loaned at 6 per cent.		7,260
Profit on circulation		$2,023

If 4 per cents, as in times past, rise until they are no more profitable for investment than other securities, we can find by a simple algebraic calculation what they will soon be worth. Let y represent the *market* value of $100,000 of bonds. Then $4,000 + 6 per c. of $85.5 per c. of $y - 30 - \frac{1}{23\frac{1}{2}}(y - 100000) = 6$ per cent. of $y + 46$. Working out the equation, we find that $y = \$159,435$. Under the proposed laws, therefore, 4 per cents at 159⅝ would be as good an investment as they now are at 121.

If the Administration would concede that there was a certain amount of common sense in the ideas which received the assent of Thurman, the support of Pendleton, and the whole-souled devotion of Ewing, I hardly think they would propose to repeal the tax. It is the national credit which gives value to our currency, and the nation ought to reap the benefit. Some of us in the West cannot help calculating that if *one* per cent. bonds were made the basis of circulation the national banks would still have a bonus.

Very respectfully,

Chas. B. Spahr.

Columbus, O., Dec. 13.

OUR COAST DEFENCES AND THE NAVY.

To the Editor of The Nation:

Sir: In his communication in 961 of the *Nation* on the subject of the navy, Mr. Chappel seems to have missed the point of the quotation he makes from the letter from "C. H. S.," in No. 957, and proceeds to demolish a theory which was not advanced. "C. H. S." merely said that "the well-known defenceless state of our coasts . . . would lead to an attack on our rich maritime cities." There is nothing in this about "a European state transporting an army sufficient to retain" them. Such a proposition is absurd. But the fact still remains that these cities are unprotected, and that an armored fleet of moderate power could enter any one or all of them and sail away unmolested, after exacting a heavy indemnity, which all the strength of this rich republic would be powerless to prevent in the present state of its navy and land fortifications. In 1879 the Admiral of the English Mediterranean Squadron said to an American naval officer that in three weeks after a declaration of war between the United States and England, fleets would appear before our great Atlantic cities demanding not money alone, but wheat and flour. Under such circumstances we should lose in a day the cost of an efficient navy five times over. Far better that the premium on our national insurance, as your correspondent aptly terms it, should be spent in yearly instalments in building a navy, and so paid to American artisans for American ships, than that it should be paid down on the nail to an enemy covering our coast cities with his guns. Granted that such a "state of things is extremely improbable." War is never improbable; this history teaches if it teaches anything, and in war it is the impossible which takes place.

"The United States ought not to indulge a persuasion that, contrary to the order of human events, they will forever keep at a distance those painful appeals to arms with which the history of other nations abounds. . . . If we desire to avoid insult we must be able to repel it. If we desire to secure peace, one of the most powerful instruments of our rising prosperity, it must be known that we are at all times ready for war."

This is as true to-day as when Washington said it ninety years ago. We have inherited from the civil war a dangerous confidence. The South had no naval power at all, no yards in which to build ships, no works to equip them when hostilities commenced. The North had nearly a year in which to prepare, and bought a heterogeneous fleet of vessels of every kind, from an ocean steamer to a Fulton ferry-boat. These served their purpose and were sold for half their cost when the war was over. The progress in naval science in the last twenty-five years is greater than in the two centuries preceding, and measures which were possible and feasible in 1861 would be useless now. The decisive point of a war of to-day may come in the first few months. There will be no time when war is upon us to think of means of defence. Peace is the time for that.

Our national defences are a standing reproach against us. Our forts are worthless. Our guns would be as effective against modern armored vessels as bean-blowers in the hands of our small boys. Our navy is composed of a few slow, obsolete wooden corvettes. We do not need such a navy as several of the European nations seem to consider it necessary to support. We have no outlying colonies to protect, no vigorous foreign policy to sustain, no possible enemy on our borders. We require an armored fleet of sufficient defensive strength to protect our coast cities, and swift cruisers powerful enough offensively to destroy the enemy's commerce in time of war, and protect our own in time of peace. They should be equal to any vessels of their kind in the world. The latter class will give us an ample number of ships for peace cruising, the former a reserve capable in a few weeks of passing from a peace to a war footing—in short, a navy that would be efficient, one that would require no increase in the number of officers now allowed by law, but a slight one in the present force of enlisted men, and at no greater annual cost to support than is now appropriated yearly by Congress for the purpose. In case of a foreign war it would be on the navy that the brunt of the fighting must fall. The *personnel* of our naval service is equal to that of any in the world. Our officers are a patriotic, well-educated, fine body of men. They only ask for modern weapons to fight a modern war—weapons that they will not be ashamed of and with which they will have some reasonable hope of winning the battle.

E. B. R.

Bethlehem, Pa., Dec. 10, 1883.

DECAY OF SPRUCE IN THE ADIRONDACKS AND NORTHERN NEW ENGLAND.

To the Editor of The Nation:

Sir: The suggestion of your correspondent in last week's *Nation* that the spruce throughout the

greater part of the Adirondack region is dying so fast that the region will be bereft of its timber through natural causes much sooner than by cutting it down for lumber, is certainly a strong reason why no lumbering should go on in that region at all. On the other hand, the owners would do well to send lumbering parties into the Adirondacks to cut down the dead timber, and thus prevent the further spread of the disease, whatever it be, whether constitutional to the tree, climatic, or entomological.

When our spruce forests suffer thus, the best treatment would appear to be to clean out the dead and dying trees so as to allow a new growth to spring up. That this would be worth trying may be seen from the following historical facts:

During the years 1878-80 large tracts of spruce and fir on the coast of Maine, from Portland to Warren, were killed outright by a little caterpillar known as the spruce bud-worm. The trees died *en masse* over large areas. The dead trees have by the more intelligent owners been cut down and used as fire-wood. The injury was most marked on the shores of Casco Bay. It now appears, from statements made to us by a clergyman of unusual powers of observation, and who suffered the loss of a fine forest of spruce on his own woodlands, and was shrewd enough to at once cut it down and sell it for fire-wood before it got too rotten—it now appears that the same woodlands were, early in this century, ravaged by the same or a similar caterpillar. According to two farmers well known to our informant, the spruces of Harpswell and Orr's Island were destroyed by worms in 1807. This was during the embargo, when no salt could be had. The owners of the woodlands turned the dead spruce and fir to good account. For six weeks they toiled, cutting down the trees and using the wood as fuel to boil the sea-water, and thus supplied themselves with salt. As we have reason to know, those woodlands were thirty years ago covered with a flourishing growth of valuable spruces, many of them a foot in diameter at the butt.

It is thus a fact that when spruce trees die down over large areas, by removing the dead or dying trees, leaving the healthy and slightly affected trees, and especially the young small trees and shrubs, a new growth will certainly spring up within thirty or forty years. This treatment, if applied to the valuable spruce forests of Northern New York and New England, will, it seems to us, certainly save these forests from otherwise hopeless ruin. This, if we mistake not, has been the remedy applied in Europe. But to add to the calamity by lumbering in these spruce forests would be folly. It would be the total and irretrievable destruction of these valuable possessions, to say nothing of the consequent partial dying up of the sources of our rivers, and the diminution of our water power.

A. S. Packard, Jr.

Providence, R. I., December 20, 1883.

OTHER-WORLDLINESS.

To the Editor of The Nation:

Sir: It is Leigh Hunt who says (see 'Religion of the Heart,' published by John Chapman, London, 1853, page 60):

"Other-worldliness is the piety of the worldly. It is the same desire for the advantages of the world to come which the worldly-minded feel for those of the present, and it is manifested in the same way."

This, in answer to your correspondent from Easton, Md., who, in your last, questions correctly the soundness of Dr. Phelps in ascribing the invention of the word to Lowell, who can well afford to resign this one word to a brother-poet. W. O. White.

Brookline, Mass., December 21, 1883.

To the Editor of The Nation:

Sir: Mr. Stearns is right in tracing "other-worldliness" as far back as Coleridge. Henry Crabb Robinson, in his Diary and Correspondence (II., 215), quotes the following sentence from Allsop's 'Letters of Coleridge': "As there is a worldliness, or too much care for this life, so there is another worldliness, or other-worldliness, equally hateful and selfish."

Respectfully, Rollo Ogden.

Cleveland, O.

Notes.

The English Publishing Co., 23 Park Row, having made arrangements with the London publishers, will begin next week the reissue in this country of the *Fortnightly*, *Nineteenth Century*, and *Contemporary Review* at half the price of the original editions.

Under the title of 'English Rambles, etc.' (Boston: James R. Osgood & Co.), Mr. William Winter has put together some pleasant letters recently written in England, and bound with them a number of agreeable verses, many of them of the "occasional" kind.

The art of flower-painting is one which, if followed as a specialty, demands thorough botanical knowledge, so far as flower construction is concerned, and the rendering of the specific characters. This may be done through either of two methods of representation, that of pure local color unmodified, of which Japanese flower-painting is the best example; and that which gives the actual optical color, *i. e.*, the local tint as influenced by light and shadow, reflection, etc. The former is, for purely scientific purposes, unquestionably the best, and that in which the artist is least likely to fail from want of artistic training, although the results of the other method, when thoroughly successful, contain all that botany requires, with an added grace of art. But it requires a sense of color of the greatest delicacy, and a training which, when obtained, does not often leave the artist in the flower-garden. To attempt a compromise between the two, as does the painter of 'Flowers from Hill and Dale, by Susie Barstow Skelding,' is certain to accomplish but mediocre results. To follow a pure local color through varying shadows and never disturb its purity, is not so easy as it seems. Of the still-life painters who accomplish it, the English William Hunt is the master. To give, in place of true *tone color*, a deeper shade of the *same tint*, as the painter of these flowers does, is one of those compromises which must be relegated with good intentions unfulfilled. The publishers (White, Stokes & Allen) have made a showy holiday book of them, which is also produced in the fringed Christmas-card form, each number containing four plates called "Flower-Song Series," and each plate being accompanied by appropriate selected poems, the whole of the parts being pleasant gift books, but not really artistic work.

Painting on porcelain is becoming a popular amusement with us, and a little book carelessly entitled 'China Painting,' by Florence Lewis (Cassell & Co.), will serve to introduce to the technical mysteries of that branch of decorative art those who already know something of painting. Its patterns are carefully executed chromos, which perhaps serve as well as any on paper could, but which will not show what troubles the beginner most, the change of color in firing. The taste of using realistic design in purely decorative work is debatable, but we do not accept it as in accordance with the best traditions and examples, or with the rationale of decorative art. Such work, to perform its function, must avoid all pretext of utility, and not try to do what it cannot do better than can be done by other methods. The best decorative art the world has yet seen, and the best schools of decoration to-day—the Japanese, Chinese, Persian, and Indian—employ designs either geometric or conventional. This is owing to a sound and correct taste (not to use the disputable term "art-instinct"). Naturalism is almost unavoidably the death of that freedom and playfulness which ought to be the element of true decorative design, and good ornament is consistent with the widest departure from nature.

John Wiley & Sons have issued the last two numbers of Ruskin's *Fors Clavigera*. "Dust of Gold" (apparently a reply to sundry hectoring letters, from young women who fear that they are plain, about the late number in which he prescribes seven beaux for every belle: "What are plain girls to do?") and "Ashestiel," a medley on Mungo Park and Sir Walter Scott. As the truest picture of the man Ruskin which he has ever permitted to be published, *Fors Clavigera* merits study of a more serious character than it has generally found.

The November *Portfolio* comes with two brilliant and exceptionally good etchings, one of the interior of Westminster Abbey, a good specimen of printing as well as etching; the other, of "Meadows at Marlow on the Thames," by Brandard, a plate which distinctly betrays the taste and training of a line engraver. The articles on Glasgow and Ravenna are needlessly weak in the illustrations, and that on Parisian architecture very well illustrated as usual.

The *Magazine of Art* for January (Cassell & Co.) contains, as usual, a large number of woodcuts not notable for any superlative quality. The most taking article is that on Carlyle, with all the known portraits, of which the only good one (as here rendered) is Boehm's statue. Whistler's portrait is villanously mistranslated. The frontispiece is a block-phototype print after Burne Jones's "Evening Star"—more interesting as reproduction than as picture.

The uncovering of the new façade of the Duomo at Florence took place on the 5th, accompanied by immense enthusiasm. The conclusion of this really admirable work, so long awaited, and which effaces one of the most annoying disfigurements of Florentine architecture, will as a whole be a great pleasure to visitors to Florence, whatever exception to the *ensemble* may be taken by the anti-restorationists.

D. Appleton & Co. have issued a revised edition of their 'Hand-book of Winter Resorts,' which is well calculated to give one a general survey of the field if not to determine one's choice. Those who have visited Monterey (Cal.) will find the account of it here given an understatement. If the editor, too, will read the last report of the State Geologist of New Jersey, he will perhaps feel justified in grouping the resorts of this State by themselves, as in the case of those of South Carolina, Florida, etc.; more of them, at least, ought to be mentioned.

Grace Greenwood has provided American girls with a volume of interesting and healthful reading, in her life of Queen Victoria in the "Exemplary Women" series (New York: John R. Anderson and Henry S. Allen). If exemplary means suitable to serve as an example, it may be asked whether the surroundings of royalty may not so far obscure the native elements of character, that the book, however entertaining and instructive, will fail of its direct moral purpose. This can only be answered by giving the book a trial. The autho

herself, in the preface, expresses her opinion on this matter with excellent sense: "I have done my work, if lightly, with entire respect, though always as an American and a republican. I could not do otherwise, for, though it has made me in love with a few royal people, it has not made me in love with royalty. I cannot but think that so far from its being a condition of itself ennobling to human character, those born into it have often to fight to maintain a native nobility—as Queen Victoria has fought, as Prince Albert fought—for I find the 'blameless Prince' saying: 'To my mind, the exaltation of royalty is only possible through the personal character of the sovereign.'" These words of Prince Albert express the spirit in which the work has been done; and they indicate also, we think, the real greatness of Victoria as a queen—that, for almost the first time on a large scale and for a long series of years, the moral standard of private life has been carried into the government of a great nation, and given it its character. A statesman of Mr. Gladstone's type is a fitting outcome of the Victorian period. The book, if it sometimes aims too directly at liveliness, is always entertaining and in a good spirit. One can hardly open at a page without being drawn on to read further. There are three portraits of Queen Victoria, one of Prince Albert, and one of the Duchess of Kent, mother of the Queen.

To teach athletics to the British nation would seem presumptuous on the part of Americans. The London firm of Sampson Low & Co., however, have bespoken of the Messrs. Harper a set of plates of Mr. Blaikie's new manual for home and school, 'Sound Bodies for Our Boys and Girls.'

Information comes to us from England that Mr. R. H. Shepherd proposes to issue shortly a reprint of the now very rare Boston 1827 edition of 'Tamerlane and Other Poems,' in which Poe's poems were for the first time collectively published. Not more than three or four copies are known to have survived an untoward fate. Mr. Shepherd's edition is limited to 100 copies.

A work deserving the attention of students of art history is the finely illustrated historical study by J. Rolland, on the Cathedral of Ste. Cécile, at Albi, France (Toulouse, 1883). This cathedral, which contains some remarkable art productions, including statues of the Apostles, and a painting of the Last Judgment, was begun during the troublous time in the Albigenses country about 1282, under the Bishopric of Bernard di Castanet, and completed in 1383. Many of the paintings and decorations show an Italian influence, some as late as the fifteenth century. The massive construction of the building, with its donjon-shaped towers, has a decided military aspect. The building has lately been restored, and the admirable photographs accompanying the work show it in all its primitive beauty and grandeur.

Outing and the *Wheelman* have become one—the latter absorbing the former, and remaining a very handsome and readable magazine (Boston: The Wheelman Co.).

We regret to read in the *Athenæum Belge* for December 15 an announcement of the discontinuance of that excellent journal, which has had a modest but useful existence for six years. Its continuance by other hands, the editors hope, is assured.

From across the water comes the news that the publication of the British journal of astronomy, *Copernicus*, is to be discontinued. This is much to be regretted, as *Copernicus* has held a unique place among scientific journals, the papers and articles which it contained being such as were found in no other periodical, and, moreover, being invariably of a very high order of excellence. The reason given for its discontinuance is that the editors cannot find contributors, and if this is the case it surely is a sad commentary on the present state of astronomical science in England.

The great comet which appeared in the autumn of 1882 is destined to take its place among the most remarkable of these celestial visitants, and it is satisfactory to know that permanent contributions to its literature are beginning to appear. The most recent of these is a quarto paper by Mr. William C. Winlock, assistant astronomer at the Naval Observatory, in which he has made a careful discussion of all the observations of this comet taken at the Naval Observatory, and arranged them in the most convenient form for future use. The paper is illustrated with several plates, containing drawings of the nucleus and head of the comet, and with diagrams showing the manner in which the observations for position were made. These diagrams will be of much value, as the chief difficulty in investigating the orbit of this comet has been due to the fact that different observers used different parts of the nucleus to observe on, and in many cases failed to mention the part which they used.

—A remarkable auction sale occurred lately in this city. It is nothing new that a large and valuable library should be accumulated in Providence, nor that it should be sold by auction. But it is new that the owner of such a collection of books should give five thousand dollars' worth apiece to ten libraries to be bought at the sale. The effect of the innovation on the prices was striking, and probably not foreseen by the donor. Ten dangerous competitors were added to the usual number of buyers at such sales. Most of the libraries to whom the bequest was made were poor, and would, in the ordinary course of things, not have sent any bids. It is always doubtful whether buyers at an auction have a right to agree not to bid against one another; in the present case it would have been in the highest degree dishonorable. Accordingly no such agreement was made. The ten beneficiaries bid independently, and, as each wished to spend the whole of his five thousand, and felt afraid that if he did not secure something early he should be left in the latter sessions with much money and few books that he cared to buy, the bidding was active and the prices unusually high from the very start. Many books brought from fifty to a hundred per cent. above their market value—that is, ordinary books, for the great rarities were not extravagantly dear. The consequence is that the ten libraries find that their nominal five thousand dollars has brought them about three thousand dollars' worth of books, for which it would be only human nature that they should not feel quite as grateful as if it had been called only three thousand at the beginning. The arrangement was an experiment. We shall be curious to see if it is repeated. It seems to have worked chiefly for the benefit of the auctioneer.

—*Harper's* for January opens with three good illustrated articles, "The Quaker Poet," with a portrait of Whittier, by Harriet Prescott Spofford; "At Mentone" (first instalment) by Constance Fenimore Woolson, and "The Old Packet and Clipper Service," by G. W. Sheldon. There is very little critical or essayistic writing except in the "Easy Chair," from which post of observation Mr. Curtis discusses several topics of the day, among others that of popular city government. If we have a bad government, he says, it is because we do not care to have a better one, or even "to try to have" one. "No device can supply the want of public spirit." This is true enough, but on the other hand public spirit can not be pumped into a city by demonstrations that the city would be the better for a larger supply of it. Public spirit, like private spirit, grows out of a feeling that political work will tell, will produce results. New York political cynicism, which among certain classes is pretty deep-seated, is the product of experience, and as such deserves respect from those who have a regard for the Veracities. Has the New York cynic, by the way—the amiable cynic, who believes not merely in the general corruption of the times, but that corruption is the motive power by which the city is carried on, and that the very reformers who get up "citizens' movements" and mass meetings are not themselves beyond suspicion—has this type ever been put into a novel?

—Mr. E. V. Smalley has in the *Century* a very good account of General Sherman, whose name will undoubtedly remain as one of the greatest produced by the war. Looking back to that period, it is hard to recall the contemporary impressions produced by his career, or to believe that the time when he was thought to be a little out of his head by some people was the critical moment in which he was really proving his right to the title of a great commander. "Husbandry in Colonial Times," by Edward Eggleston, is a good illustrated article, and among the serials most readers of the magazines will be surprised to find the concluding number of "The Breadwinners." We say surprised, because the foundations of the story were broad enough to suggest a much longer novel. As it stands its chief importance lies in the portrait of Maud Matchin—a type that had not before made its way into fiction. As a product of American life Maud is a repulsive figure. The one attraction is her beauty. The other qualities—her vanity, her want of respect for her parents, her gross ignorance, set off as it is by her superficial school-girl smattering of knowledge, her greed for money (or the jewels and dress and "carriage-riding" and luxuries that money implies), her consummate vulgarity—make her more odious than many a character of a more conventionally depraved sort; and yet it cannot be denied that the author has represented Maud as the result of conditions of life hardly to be found anywhere except in this country. "The Forty Immortals" of the French Academy (by "Y. D.") is a good illustrated article, and among the "open letters" will be found a disputation on the good old subject of "New York as a field for fiction," by Mr. W. H. Bishop and Mr. H. C. Bunner. After all, the only way to solve this problem is that which has been adopted in all large cities—to try it. This both these gentlemen have done, and for that very reason we are the more surprised that they should care much about the question in the abstract. No amount of critical writing will ever convince us that New York is really a good field for fiction, as the appearance of a thoroughly good New York novel will.

—Mr. Henry James contributes to the January *Atlantic* some pleasant reminiscences of Turgeneff, of whom he saw a good deal in Paris. A strange and interesting figure he seems to have been in the little literary coterie of which he was a sort of honorary member, and in nothing stranger, evidently, than in his lack of vanity. Mr. James is so much at home in Paris, he sees things so easily and quickly from the Parisian point of view, that he noticed in Turgeneff just what his French friends probably noticed—besides other matters of which they would have taken no thought. A genius without vanity, a man "impersonal" to the point of

being far more interested in the subjects he discussed than in his own relation to them, remained to the last something of a mystery to most of the clever but decidedly "personal" Frenchmen with whom he associated. He was in truth, as it is easy to see from his stories, more of a poet than a literary "artist." His poetry was that of human character and destiny, and it is interesting to learn that he had no methodical system of novel-writing, but was inspired, as we fancy many great novelists have been before him, by his characters. What first presented itself to his mind was not a plot or story, but a living human being, out of whose character a naturally dramatic novel evolved itself. None but geniuses can write in this way. In Thackeray, in George Eliot, in Flaubert, we recognize the breed to which Turgeneff belonged. He seems to have taken little practical interest in the fierce strife over literary theories which shakes Paris to its centre from time to time, and wrote without any theory simply what came into his head. Doctor Holmes has a poem on the Saturday club, which recalls the days of Agassiz, Emerson, and Longfellow, and might be taken as a text for the next article on the "decadence of Boston." Certainly a great change has come over Boston since their day. There are Darwinians and Evolutionists where the great Swiss naturalist used to stand; there is a lecturer on Emerson who denies him the first place as a philosopher, and as for poets, the race in Boston seems to have nearly died out. The feeling that the niches left vacant will never be exactly filled is a very natural one; but what is called the decadence of Boston as a literary centre, *i. e.*, the failure of any signs of a new intellectual growth comparable to the old one in the hold which it took upon the popular imagination, is a phenomenon not peculiar to that city, but one which extends all over the world. The general modern industrial feeling that literature is a poor sort of business to be in, and one which does not pay, accounts for it in part. As we leave New England and go west we find this anti-literary feeling stronger and stronger, but in the last twenty years it has begun to affect even Boston very powerfully, and to lead the young Bostonian to look upon a life devoted to things not material more, perhaps, after the manner of the bright Chicago drummer than he would have done a generation ago. There is something very silly about writing for a living, when you consider how much you have to write, and how poor a living you get, and how much more rapidly and easily you could succeed if you would drudge for a few years at dry-goods, or, better still, get the right "points" in stocks.

—Mr. Louis Judson Swinburne has an article on "Matthew Arnold in America," in the last number of *Lippincott's*, in which he insists upon the importance of Mr. Arnold's visit as that of the first genuine critic who has been over here. The function of criticism is so doubtfully regarded by most of us that his trip has already been productive of much comment of a curious sort. The early generation of travellers who came to this country and afterward amused themselves by publishing accounts of what they had seen were not critics in the sense in which we now employ the word. From Mrs. Trollope to Dickens, they brought with them not a desire to "see the thing as it is," but to compare what they found with what they had been accustomed to at home, and with what we promised they should find here; and their prejudices, favorable or unfavorable, played a most important part in their mental equipment. Mr. Arnold, on the other hand, is what may be called a cosmic critic of the modern school, whose only prejudice is against prejudice itself. The number of people in the entire world who really believe in criticism of the cosmic sort is very small, and probably smaller in the United States than in England, and in England than in France or Germany. Mr. Norman Pearson writes on undergraduate life at Oxford, and gives a curious account of the way in which he says the 'Tom Brown' literature has reacted upon the tendencies of manners at Rugby: "The Rugbeian character is of a very distinct and not always very agreeable type. It is 'Tom Brown' pushed to a morbid excess. The ideal set up in that admirable book is that of an English school-boy *par excellence*—sturdy, straightforward, truthful, firm to his principles, and with an honest scorn of anything mean or tricksome. In the Rugby school-boy of the present day these qualities are apt to degenerate into a certain priggishness, combined with an arrogant contempt for the feelings and opinions of others, an unpleasant roughness of manner, and a habit of flat contradiction which verges on the insolent."

— The November number of the *Antiquary* contains the second part of an article by Mr. G. Lawrence Gomme, upon "Primitive Agricultural Implements." The purpose of the article is expressed in the opening sentence, which speaks of the instructiveness of a method of archæological study which traces "step by step the development in any branch of culture or industry." This idea is carried out by tracing the development of agricultural implements, first in the stone age and then in the bronze. Both papers have interesting engravings, those of the second part being especially so. One illustrates a method of reaping, described by Pliny and Palladius, in which a sort of cart, with a toothed edge, is pushed by an ox against the standing corn; another, a process of reaping depicted in an Anglo-Saxon manuscript. An article by Clapton Rolfe upon the coloring of illuminated manuscripts vindicates the accuracy of these against a newly advanced theory. The argument rests mainly upon the fact that the illuminations give, in ecclesiastical vestments, only the five colors which are known to have been employed in England for this purpose—gold, blue, purple, red, and white. Two articles, one of them by J. King Watts, contain interesting facts in relation to early land tenures, etc., and an anonymous article proposes in "Measure for Measure," Act iii., Scene 1, the reading "*deleted* spirit" for *delighted*. An article by C. E. Keyser describes the various portrayals of St. Christopher in England.

—The *Revue Historique* for September-October contains an article by M. Xenopol upon the origin of the Rumanian or Wallachian people—a subject which has been ardently debated since the publication of Rösler's treatise in 1871, which undertook to prove that these people are not the descendants of Trajan's colonists in Dacia, but migrated across the Danube from the South in the thirteenth century. This theory has been generally accepted by German scholars, although it has always appeared to us unsatisfactory: a population of 3,000,000 in Hungary alone, to say nothing of Rumania, is not so easily accounted for by a migration which has neither distinct record nor adequate cause. Neither is it easy to believe that a community which has occupied a territory 150 years should disappear from it so completely as Rösler's theory assumes to have been the case. The Romans struck deep roots in every country which they occupied, and when we find in the nineteenth century several millions of people, speaking a language of Latin derivation, in a country which the Romans held for a century and a half, it would require the most positive evidence to make us believe that there was no connection between the two facts. M. Xenopol shows in this article that there is no such overwhelming weight of testimony, and, in fact, that there is pretty good evidence of the persistency of the Romanized population during the Middle Ages. He considers the opposing arguments in detail: The fact that the Rumanians have the Bulgarian form of Christianity he explains by their country having formed part of the first Bulgarian kingdom (ending 1018); the Slavonian character of the Slavic elements in their language (rather than Ruthenian), by the same circumstance; the alleged paucity of Dacian or Roman proper names, by pointing to the names of several rivers, and especially of mountains. Names of cities would, of course, not be preserved by a people which took refuge in the mountains, but it is noticed that the Rumanians give to the cities of Transylvania their Slavic names rather than the German or Magyar, from which it is inferred that they occupied the country after the Slavs entered it, and before either Germans or Magyars came. The Albanian elements of the language he attributes to the native Dacians of Thracian or Albanian race; and, in fine, he adduces several allusions to Wallachians in this region which seem inconsistent with the alleged migration. The same number of the *Revue* contains the second and concluding part of a very valuable article by M. Fustel de Coulanges upon the Immunities of the Merovingian period.

— A year and a day ago we called the attention of our mirth-loving readers to the oddest of all eccentricities in book-making, namely, the 'Schlau, Schläuer, am Schläusten' of C. M. Seyppel, or the tale of King Rhampsinitus and his treasure-house, printed on torn, stained, almost mouldy leaves, as if an Egyptian find of remote antiquity. The success of this "Ægyptische Humoreske," with its comical German verse, and its screaming illustrations after the Nile monuments, has inspired a still more elaborate joke, 'Er, Sie, Es,' by the same artist and the same publisher (Düsseldorf: Felix Bagel; New York: Westermann). In the present case, Seyppel has abandoned Herodotus, and trusted to his own wit in inventing a sequel to his former work. He (in the person of a would-be poet laureate, ready to lampoon the reigning monarch if his ambition is not gratified) tells how the clever thief who married the daughter of the late Rhampsinitus contrived to obtain a plébiscite in his own favor, as against his wife, for the succession to the throne. A final spree on the eve of his coronation involves him in perils requiring all his craft to extricate himself. In the civil dissension *Krimsab* acts as moderator, readily recognized as Bismarck by the three spikes on his helmet and by other signs. The fun is very good, but the ingenuity is not quite on a par with that of the legend of Herodotus. The archæological make-up, however, even surpasses last year's performance, particularly in the cover, which is an excellent imitation of mummy cloth, and bears a solid green seal of King Ruppsippos (the "Er" of the story). Dr. Georg Ebers, in a published letter, testifies to his enjoyment of this burlesque, all the more because of its fidelity to Egyptian art. Caricaturist as he is, Seyppel here and there—as in the picture of Ruppsippos crawling through the drain, and in the laughable design at the very end of the book—indulges his sense of beauty, which may never, however, win him greater renown than his invention of this extraordinary mode of "illustration."

—The large attendance at the first concert for young people, which Mr. Theodore Thomas and his orchestra gave on Saturday afternoon at Steinway Hall, proved that there was a real

demand for such a series of entertainments. The audience consisted of young and old children in about equal proportions, and all the pieces on the programme were welcomed with signs of appreciation. There is plenty of pianoforte music specially designed for youthful performers and bearers, but for the orchestra the range of juvenile literature is not extensive, and the programmes have to be chosen, therefore, from the standard works of the great masters, preference being given to what is graceful in melody, simple in harmony and rhythm, and, if possible, connected with some tangible image or story which facilitates comprehension. These characteristics were found in Saturday's programme, which was as follows: Overture to "Preciosa"; Larghetto, Beethoven's Second symphony; an aria from "Magic Flute"; Scherzo and Wedding March, from "Midsummer Night's Dream"; ballet air, "Paris and Helene" (Gluck); Waldweben, from Wagner's "Siegfried." The Beethoven and Wagner selections might seem at first sight rather "heavy" for children, but they are not. The larghetto is as simple in melody and structure as one of those fairy tales, of Grimm or Andersen, which old and young alike appreciate; and Wagner's Waldweben is such a realistic translation into tones of the idyllic scene where *Siegfried* lies under a tree and listens to the rustling of the leaves and the twittering of the birds, that no one could fail to appreciate this tone-poem. The vocal numbers were sung with clear voice and distinct enunciation by Miss Amy Sherwin. None of the children showed any signs of fatigue to the end of the programme, and the best proof that the concert was appreciated was shown in the manner in which the ticket-office was surrounded at the close for seats for the next concert, which will take place on January 12, at 2 P. M. It will consist of the following programme, which is, if anything, even more appropriate than the first: Overture, "Magic Flute"; airs de ballet from Gluck's "Orpheus"; Allegretto, Beethoven's Eighth symphony; Schubert songs (Miss Ella Earle); Weber-Berlioz's "Invitation to Dance"; Rossini's "Tell" overture; variations on "God Save the Emperor," Haydn; Schumann's "Two Grenadiers" (Mr. Remmertz); Gounod's "Funeral March of a Marionette"; Strauss's "Blue Danube Waltz."

JAMES'S WILD TRIBES OF THE SUDAN.

The Wild Tribes of the Soudan: An Account of Travel and Sport, chiefly in the Basé Country. Being Personal Experiences and Adventures during Three Winters in the Soudan. By F. L. James, M.A., F.R.G.S. Dodd, Mead & Co.

THE appearance of this book at this particular time is certainly very opportune for the author and the publisher. All eyes are turned towards the Sudan, to see what new move will be made by El Mahdi and his horde of fanatical followers. Every one is anxious to know all that can be learned about those savage tribes which could, in a single battle, completely destroy an Egyptian army of 10,500 men, officered and commanded by Englishmen of rank and distinction. And if the book we have under consideration contained any information concerning the country and people of that part of the Sudan which is the field of the False Prophet's operations, the author's apology, in his preface, "for adding another to the numerous books of travel that have been written during the last few years on Africa," would be entirely unnecessary.

Unfortunately, however, for the reader in search of knowledge of the Sudan, the title is misleading and deceptive in the highest degree. The mongrel people which our author very sparingly describes, are really not Sudanese at all. They are a very insignificant tribe dwelling in a border land which lies between Abyssinia and the Sudan. Abyssinia is a high mountainous plateau region. The Sudan is a vast region of rivers and plains, deserts and jungles, which extends from the Nile indefinitely westward, and comprehends many provinces and peoples. Between these two is a hilly, broken country, in a part of which dwell the Basé. Like their country, they are a half-and-half-race, the result of a mixture of the Abyssinians with the real negroes of the further interior, with perhaps a small infusion of Arab blood in their veins. There are other similar tribes in the vicinity of Abyssinia. The Bogos tribe and the Shohos, who inhabit the hill country lying between the northern provinces of Abyssinia and the Red Sea coast on either side of Massowah, are a very similar people—similarly located and similar in appearance, manners, customs, and general characteristics. These border tribes, living thus between the fierce, semi-civilized, nominally Christian Abyssinians on the one side, and the crafty, well-organized, though decaying Mohammedan Arabs on the other, enjoy the unenviable position of being a sort of buffers between national powers greater than themselves. The Swiss, under somewhat similar circumstances, have been compressed and consolidated into a most homogeneous unit, whose internal strength has been able to resist centuries of external attrition. The African border tribes, on the contrary, are ground into a kind of ethnical powder, and are almost entirely devoid of tribal coherence. As Mr. James says of them, every man's hand is against them, and their hand against every man. Yet they are not friendly among themselves, and can hardly be said to have any tribal existence.

But when the inhabitants of a certain number of villages possess in common a predominance of certain characteristics, they are designated by a common tribal name. Such are the Basé, in whose country our author travelled and hunted during three seasons. His reasons for selecting their country were twofold. The Basé were an unknown people and their land a *terra incognita*. No Englishman had ever visited it except a Mr. Powell and his wife, who were murdered by the treacherous natives. But the grand charm which lured Mr. James and his party to this inhospitable region, and made them brave the craft and cruelty of a persecuted people, was that their country had not been "shot over," and was not "shot out" by huntsmen, as were other parts of Africa which were otherwise more attractive and more accessible.

And this gives us the reason not only for the journey, but for the book. The author is evidently a most enthusiastic hunter, and very proud of his prowess; and his book is little more than the diary of a huntsman. We have in the first few pages the usual description of preparations and outfitting for African travel; the gathering and organization of a party; the selection and securing of servants, waiters and cooks; and in this case even the employment of a doctor, who proved to be a personage very difficult to find to the entire satisfaction of the principals of the expedition. But in good time a start is made from England, and then comes the addition of Arab attendants in Cairo, followed by the trip to Suakim, and the gathering of camels, horses, porters, camel-drivers, and ostlers, and the organization of a caravan, with all the usual hindrances and delays caused by haggling traders. With all of these details readers of African travel are familiar *ad nauseam*. But we are destined to have several repetitions of the same dose.

From Suakim to Cassala the party finally journeys over a desert route, and accomplishes a disagreeable march with but little incident worthy of note. The sickness and death of one of the servants show Mr. James to be a kind and thoughful master, and here it may be mentioned that in all his travels, and under all circumstances, he seems to have been humane to the people with him, and to those among whom he went. This is in pleasant and striking contrast to the conduct of some travellers who have visited Africa for exploration or sport. At Cassala more preparations are made, more camels bought or hired, more camel-drivers obtained, and guides secured. And now, after having been with this party for one month and a half, and having followed their chief and chronicler through sixty pages of his book, we are invited to start on the long-promised visit to the Basé, and the untried hunting-grounds which they inhabit. The route follows the dry bed of the Gash, camping places being found either where water stands in pools in the river's bed, or where wells have been dug by the natives. Sometimes the trail leaves the river to cut off a bend in the stream, and carries the caravan through the thorny jungles of the banks. The party finds game abundant *en route* and in the vicinity of the various camps, so that the larder is well supplied with the flesh of fowls and ruminating animals. But they are much disappointed at the scarcity of lions, elephants, giraffes, and other nobler game.

After two weeks of this life we are at last presented to the Basé near one of their small villages, on the 30th day of January. The next day, a larger village, named Koolookoo, is approached, and we become better acquainted with the people whom we were told in the beginning were so formidable that friends and well-wishers of our party had advised against visiting them. The Basé proved to be, however, a very timid folk. At the first sight of the approaching strangers, hundreds of men, women, and children fly from their homes, and clamber, in frightened crowds, up the almost inaccessible heights behind their village. Friendly signs and the display of presents bring about a palaver, which results in the villagers becoming not only very friendly, but distressingly affectionate. The whole population abandons the village and surrounds the camp, seeking presents of beads and strips of cloth, and provisions. Though they become troublesome to the travellers, they serve one useful purpose in acting as scavengers for the camp. They eat voraciously all cast-off parts of the game.

From Koolookoo the hunters advance by a few short marches further up the river, until they reach a point where it is called the Mareb, thus establishing a geographical point of some importance, namely, that the Gash and the Abyssinian river Mareb are one and the same stream. Game becomes very abundant, and the hunters have fine sport. Buffaloes are frequently "bagged," an ostrich is stalked, elephant tracks are seen, and our Nimrods begin to feel that their brightest anticipations are about to be realized. But disaster awaits them. Two of the party, while hunting, encounter a company of Abyssinians about a hundred strong. They endeavor to make friends with the new-comers, and foolishly lay down their arms as a sign of peaceful intentions. At once the Abyssinians pounce upon the rifles, seize the horses, strip the hunters of their paraphernalia and some of their clothing, spear their servant, who offers some resistance, and hustle the whole party about in a very rough manner. But they manage to escape from their treacherous assailants, and make

their way back to camp. Here confusion and fear reign supreme for a while. Camel-drivers are about to stampede; guides are grumbling; servants are trembling. The Englishmen succeed in restoring order, but find in a few days that it is inexpedient to remain longer where they are, and impossible to advance. So their steps are retraced to a station named Haikota, about three days' march from Cassala. From this point the party moves across the country to the Settite River, and spends three weeks more in hunting and fishing, the Settite being a beautiful running stream. This part of the narrative is perhaps the most interesting, but it is too nearly a repetition of what has gone before to justify an extended notice of it. From the Settite a long and tiresome journey is made to Massowah, *via* the Egyptian posts of Amideb and Keren or Sanheit.

Such is a brief outline of Mr. James's story. We shall now have something to say of the manner and style in which that story is told. Briefly, it is very badly told. The descriptions of scenery and topography are not at all graphic, though the excellent woodcuts, made from photographs taken from nature, show that a real lover of nature might easily have been stirred to enthusiasm in making pen-and-ink pictures. The account given of the Basé tribe is altogether inadequate, considering the fact that Mr. James claims to have been the first European to make their acquaintance. Even the hunting experiences which, as has been already remarked, form the burden of the book, are told in a style so tame and halting that one feels grieved that so good material should be so badly used. After reading Captain Cumming's spirited descriptions of his famous hunting exploits, one follows Mr. James's feeble narrative with a feeling of impatience. Sir Samuel Baker, too, not only shot well, but wrote well, and carried his reader with a rush through his hardy adventures. It is true, some critics who knew Sir Samuel well declare that the accounts of his deeds are too highly colored, or are even apocryphal in some cases. Yet no one denies that his books are very entertaining reading. Mr. James's style is often very clumsy, sometimes even ungrammatical, and generally colloquial and inelegant.

The publishers' part in the manufacture of this book is, if we except the more gaudy than tasteful cover, worthy of all praise. The paper and print are both excellent, and few palpable typographical errors mar the letterpress. The illustrations are generally beautifully engraved. The maps are well executed, and the one containing the author's itinerary through the Basé country contains some new and valuable geographical information.

Life of William Rollinson Whittingham, Fourth Bishop of Maryland. By William Francis Brand. With portrait and facsimiles. E. & J. B. Young & Co. 1883. 2 vols.

THE interest of these bulky volumes will be almost exclusively for Bishop Whittingham's co-religionists, and more particularly for such of these as are more deeply interested in ecclesiastical than in moral and spiritual things. Bishop Whittingham was an ecclesiastic in every fibre of his mind. Whatever of personal, social, or domestic interests he may have had, they were subordinate to his ecclesiastical vocation. Such, at any rate, is the impression that we get from this biography. But the reason of this may be that his biographer was attracted to him mainly on the ecclesiastical side. Certain it is that he has given us hardly a glimpse of any other. We have hundreds of pages of official correspondence, memoranda, etc., and we have hardly anything besides.

The life of Bishop Whittingham had a remarkable consistency. He was a Nazarite from the womb. The impulse of his character and career came from his mother, a woman of remarkable abilities, who assumed the sole responsibility of shaping his mind, resenting any interference, and she never abdicated her original position. So long as she lived she claimed the first place in his affections, the first voice in his affairs. Unable as a child to enjoy her Christmas presents because thinking "We must die," this intense religiosity marked every period of her life and was transmitted to her son. It is astonishing that he was ever able to hold an active and influential position among men, his childhood and his youth were nursed in such inviolable seclusion. Seeking entrance to the theological seminary, he was asked at what college he had graduated, and answered, "None; my mother has always taught me." "But who taught you Latin, Greek, and Hebrew?" continued the examiners. "My mother," he replied. At this time he is described as being nearly six feet in height and very thin, wearing a round-about jacket and a wide turn-over collar, making a most unclerical appearance. His fellow-students were at first inclined to laugh at him, but his genuine manliness soon compelled their admiration.

The account given of his wedding-day is as characteristic of the man as any passage in his biography. It was on the 15th of April, 1830, when he was twenty-four years old. He arose at a quarter after five, and after exercises of devotion read the last of Bishop Ravenscroft's sermons and commented on it. After breakfast he drove from New York to Orange, New Jersey, with a friend, the two conferring as they went "on the test of Christian standing from St. John v. 30, and also on the power of grace in the destruction of evil tempers from Luke iv. 33–36." Arrived at Orange, he spent an hour at the piano with his parents and sisters. After dinner he wrote out a sketch of a sermon on "Overcoming evil dispositions through the grace of God," "thus fixing the thoughts of the forenoon." Then he visited a sick parishioner and solaced him with prayer and Scriptural exposition. The remainder of the afternoon he spent alone in meditation and prayer. In the evening he wrote a sketch of a sermon on "The example of Christ," finishing it just in time to proceed to the marriage ceremony at the church. At the wedding supper he obtained from a hesitating parishioner "an almost promise to receive baptism, and a full acknowledgment of the necessity of so doing."

Here we have in little all the sphere of the good Bishop's life. Holding an office to which the taint of worldliness has frequently attached, a less worldly man than he, it would be safe to say, has never been a servant of the Church. He was narrow in his culture and his sympathies, but he brought to his ecclesiastical labors an entire devotion, an unwearying consecration. The temper of the man was as ascetic as that of Dominic or Francis; its habit different from theirs only because he fell upon a different time. His abjuration of the "pomps and vanities" was no verbal matter. Not only the theatre but the oratorio he denied himself, as not tending to edification. Here was a nineteenth-century Puritan, an American Calvin, who would fain have made his diocesan rule as strict as Calvin's at Geneva. But he was a Puritan with a difference. He was very far from Puritanism in his delight in ceremonial observances. Romanizing tendencies, so called, were conspicuous in his speech and action. He magnified the ritual and the sacraments. Houses of religious celibates found favor in his eyes.

His earliest work was for the Sunday-School Union. A rectorship in Orange followed; then work in New York at denominational editing and publishing, and the rectorship of St. Luke's. An incident of his labors here was the great fire in New York, on which he preached a sermon for which a captivated listener gave him $20,000 cash for charitable purposes. Sickness, threatening consumption, drove him abroad in 1834 for fifteen months. He came back to a theological professorship, which he exchanged in 1840 for the bishopric of Maryland, and he held this office till his death, October 17, 1879. He was born December 2, 1805.

The Maryland bishopric was no sinecure. Its affairs at Bishop Whittingham's coming were in the most depressed condition. Gradually he brought order out of chaos, and established a rule that reflected ample credit on his administrative ability. When the civil war broke out he threw himself cautiously but firmly on the Union side. A reviewer of these volumes in the *American Church Review* wishes "that the recording angel might drop a tear upon this episode of Bishop Whittingham's career and blot it out forever." But to many it will wear a very different appearance. His biographer is careful to inform us "how utterly he abhorred that spirit which was cherished as philanthropy and called abolitionism." Yet he held that the white population was more injured by slavery than the black, and the slaveholding portion most of all; also that its abolition was impossible, "and its attempt *in any way* by the North, an enormous crime." Here was an astonishing position for a man to hold. But more astonishing was his assertion that while holding slavery to be a great social evil, the wisest and best of the Southern people had "no hope of its being removed from their posterity." The war was not for him the dawn of such a hope. It was not slavery but secession that put the South in the wrong, and justified national coercion. The Bishop's thinking here was of a piece with all his thinking: authority, prescription, custom, tradition were his ultimate foundations. To find a rational basis for doctrine or conduct was no part of his ambition; but what seemed to him right, for any reason, to that he held fast. His adherence to the Union cost him many friends. He would not have swerved if it had cost him all.

So immersed was Bishop Whittingham in ecclesiastical affairs that his life, by whomsoever written, could not have been very interesting to the general reader; but his present biographer has made the worst of a bad matter. His style belies him if he does not hold that the use of language is to conceal our thoughts. A judicious writer could have made a book not half so large as this which would have helped to make the Bishop's fame endure a while. This is a premium upon the waters of oblivion, for except by a few ecclesiastical Dryasdusts it will not be read.

Telegraphic Determination of Longitudes in Japan, China, and the East Indies; with the Latitude of the Several Stations. By Lieut.-Commanders F. M. Green and C. H. Davis, and Lieut. J. A. Norris, U. S. N., in 1881 and 1882. Washington: Government Printing Office. 1883.

THE earlier geographic work of Lieutenant-Commander Green and his parties, in determining with modern precision the longitude and latitude of a large number of points on the globe, chiefly in the West Indies in 1877, and on the eastern coast of South America in 1878 and 1879, is well known. He has now added very largely to his already enviable record by the publication of the results of his later labors,

which establish the precise positions of a dozen eastern Asiatic stations with a probable accuracy far exceeding all the demands of navigation, and which will meet the needs of astronomy for a century to come.

The longitudes of very nearly all the prominent positions in the East Indian Archipelago, and on the shores of the China and Japan Seas and the Western Pacific Ocean have been referred by surveyors and hydrographers to one of the following points, viz.: Singapore, Batavia, Manila, Hong Kong, Shanghai, Nagasaki, and Yokohama, the accuracy of the chronometric measurements from these central points to the various capes, islets, mountains, towns, light-houses, and other prominent positions, some 3,000 in number, leaving little to be desired, were the longitudes of the initial points exactly known. Unfortunately this has not been the case. The longitudes of these secondary meridians, which have been accepted for the last forty years, have depended mostly upon observations of moon-culminations, made doubtless with great care, and with the best appliances available at the time, but liable, in common with all such determinations, to an uncertainty of from one to four minutes of arc. This uncertainty has, of course, affected in an equal degree all chronometric measurements from the meridians in question, and longitudes have consequently been shifted back ward and forward by hydrographers of different nations on their respective charts, according as a greater or less weight was theoretically attached to various determinations of the initial point.

The proposed publication of new charts of the China Sea, on a large scale, by the Hydrographic Office afforded an additional inducement to attempt the removal of the uncertainties attending the longitudes in this part of the world; and the completion of the measurement from Europe to the Atlantic ports of South America having liberated the instruments used for that purpose, a party of officers was organized by the Chief of the Bureau of Navigation in the winter of 1880 1881, with the object of determining telegraphically, from one or more established meridians, the longitudes of the points in Eastern waters from which American, English, French, Spanish, and Dutch surveyors had made several thousand chronometric measurements. This work had been urged upon the Navy Department by the National Academy of Sciences by resolution at its April meeting in Washington, in 1880.

The established points were at Madras, in British India, and at Vladivostok, on the Siberian coast. The observatory of Madras has been for many years the point from which the longitudes of British India have been reckoned. The position of Suez was determined with great care in 1874, by the English transit-of-Venus astronomers; and in 1876 and 1877, officers of the great trigonometrical survey of India connected Madras with Suez, through the cables by way of Aden and Bombay. The cables of the Great Northern Telegraph Company in Eastern waters extend from Vladivostok to Nagasaki, Shanghai, Amoy, and Hong Kong, while those of the Eastern Extension Company join Hong Kong, Manila, Cape St. James, Singapore, and Madras, a branch extending from Singapore to Batavia, and to Port Darwin on the northern coast of Australia.

In pursuance of the execution of this work, the necessary instruments and observatories were despatched from New York to Yokohama by way of London and the Suez Canal, to avoid the frequent trans-shipment of the trans-Pacific route, and arrived safely in Japan in the middle of April, 1881. The U. S. S. *Palos*, a small gunboat attached to the Asiatic Squadron, was selected to transport the officers and instruments from port to port, and Lieut.-Commanders F. M. Green and C. H. Davis, and Lieut. J. A. Norris, were detailed to make the observations, permission having been previously obtained from the companies owning the telegraph lines to use them for the exchange of time-signals, and from the various governments to set up instruments and make astronomical observations at the respective points.

It is not a little remarkable that, notwithstanding repeated applications regarding the subject, the officers of the Japanese Government neglected to designate some point authoritatively as the prime meridian of Japan. A permanent monument was, therefore, established on the grounds of the United States Naval Hospital at Yokohama, in such a position that when the meridian is decided upon, it can be conveniently and precisely connected with the chain of measurements. The first exchange of signals took place between Nagasaki and Yokohama on May 27, 1881, and the last measurements were made January 27, 1882, between Madras and Singapore, forming the completion of a chain 6,450 miles in length. The prime meridian of India passes through the observatory at Madras, and the kindness of Mr. Norman Pogson, the Government astronomer, greatly facilitated the connection of this long chain with the Indian meridian. The uniformly generous courtesy with which these officers of the American Government were attended is handsomely acknowledged by Mr. Green, and is worthy of especial note here:

"Our experience in other parts of the world,' he says, "had prepared us for a cordial reception and efficient assistance at the hands of the gentlemen in charge of the various telegraph cables, and our anticipations were not in the least disappointed. Not only was every assistance given in the execution of the work, but at stations away from the cities, where the officers would otherwise have been obliged to live very roughly, the kindest hospitality was extended to them. The names of all to whom acknowledgments are due would include a complete list of the officials of the cable companies at each station. The fact cannot be too strongly expressed that without the zealous and persevering coöperation of the telegraph officials, no such undertaking as this can be successful, and no one without absolute experience can realize the discouraging delays and difficulties which would be almost insurmountable without the cordial assistance of the members of the cable staff.

"It may not be out of place to state that the completion of this report terminates the association on duty of the three officers who have been principally engaged in the work, and who have successfully carried on similar undertakings together since 1877, two of them since 1874, without the slightest misunderstanding or breach of perfect harmony."

The conclusion of Mr. Green's longitude work in the Eastern seas affords a result of no inconsiderable moment, as illustrating the accuracy with which distant positions on the globe are telegraphically determinable. The cable-lines through Madras, Singapore, Hong Kong, Shanghai, and Vladivostok, employed by Mr. Green, give for the longitude of this last station 8h. 47m. 30.92s. Vladivostok has also been reached from Europe telegraphically across the overland lines of Siberia, and its position determined in 1875 by Colonel Scharnhorst, of the Russian Engineer Corps, to be 8h. 47m. 31.32s. The difference of the measurements by Siberia and by India thus is 0.39s.—a discrepancy of no great magnitude when the inevitable difficulties of the work and the vast lengths of longitude-chains are considered. Mr. Green has prefixed to his volume a chart of the world, showing in an admirable way the principal lines of submarine cables used for longitude determinations by all the different governments which have been engaged in such enterprises.

The globe has now been measured in arc, with a degree of accuracy closely approximating to the limit attainable with the modern instruments, from Yokohama (about 140° east of Greenwich) to San Francisco (about 120° west), leaving thus an arc of somewhat more than a quadrant, across the Pacific Ocean, still to be measured to complete the entire circuit.

Slavonic Literature. By W. R. Morfill, M. A. Published under the direction of the Committee of General Literature and Education, appointed by the Society for Promoting Christian Knowledge. London. 1883.

THIS little book is a very timely and useful publication. It supplies a deeply felt want in English literature, for, as the author justly remarks, "there is nothing in our language on the subject, except the work of Mrs. Robinson (Talvj), published in 1850, at New York, which is now out of date." Mr. Morfill treats, in ten chapters, of the "Classification of the Slavonic Races"; of their "Nomenclature"; of the "Early Literature" of the Russians, the Malo-Russians and White Russians, the Bulgarians, and the Serbs, Croats, and Slovenes — together forming the eastern branch of the Slavs; of the "Early Literature" of Poland and of Bohemia; of the Wends in Saxony and Prussia; and of the extinct Polabes on the lower Elbe and the Baltic. The author's subjects are the growth and primitive development of the various Slavic languages, their folklore, and their earliest literary compositions—these exclusively—and the real title of his work is to be found in the running-title, 'Early Slavonic Literature.' On the title-page, however, the word "Early" has been dropped, a serial heading, "The Dawn of European Literature," being placed above the title. Advertisements shorn of this heading may attract many a reader and purchaser anxious to obtain information about the lives and the masterpieces of Lermontoff and Pushkin, Tolstoi and Tchernyshevski, Mickiewicz and Krasinski, or other famous Slavic writers of our century and the preceding one. Such a purchaser will find to his surprise that the works of these authors are completely ignored, but will also easily discover that the book contains sound "Christian knowledge" fully worth the price, and much curious information about things he never dreamed of. For Mr. Morfill has executed his "compilation . . . from original authorities" with conscientious diligence, and with comprehensive linguistic and literary learning. In fact, if he has erred, it is by presenting to the common reader too much that is interesting only to the assiduous student of Slavic lore. His sources are the very best, and his topics well selected, but he is too fond of names, original terms, and titles. His unrhymed translations of Slavic songs are neatly executed. Among them are two gems of Serb popular poetry, ballads referring to the fatal battle of Kosovo, or properly Kosovo Polye (Blackbird Field), in which the army, the King, and the independence of Servia perished by the sword of the Turk.

The date of this battle, June 15, 1389, is correctly given on p. 8; on page 158 it is changed into "the 10th of June, 1383." We have noticed several other slips, mostly owing to careless revision—such as "Fa/merayer" (page 3) for Fallmerayer, and "Sineus" (page 26) and "Sineous" (page 28) as identical names—but they are not numerous. The author has made a very laudable attempt "to spell the proper names of those Slavonic nations which use the Cyrillic alphabet on a fixed and accurate plan"—which is very rarely done, as we have repeatedly pointed out in the columns of this journal—and has naturally "retained the original orthography" of "the names of those Slavonic peoples who use the Latin alphabet." But the want of the neces-

sary diacritical marks used by the Western Slavs —which it is surprising that the publishing society did not find means to procure—compelled him to use such misleading spellings as "casopis" for *časopis* (pronounced *tchasopis*), and "Jagic" for Jagič (pronounced *yaghitj*). Why he invariably uses "Slavonic" for Slavic, while he constantly uses "Slavs," which was formerly avoided on account of its un-English termination, we are at a loss to explain. It is, perhaps, owing to this constant use of "Slavonic" for Slavic (Ger. *Slavisch*, which is different from *Slawonisch*) that he scrupulously refrains from introducing Slavonia proper (*Slawonien*) among the countries and districts inhabited by the Slavs, always covering it by the term Croatia, Hungary, or Austria, each in its widest sense. The geographical references of the author are altogether very lax. On page 2, Northeastern Hungary is forgotten as one of the seats of the Ruthenes ("Rousines"), and the Serbo-Croats are made to inhabit the "Principality" of Servia, following a Russian author who wrote before Servia became a kingdom. According to page 6, "the Russian language is hemmed in on the west by Polish, Magyar, and Rumanian, on the south by Little-Russian"; but Russian, in the sense of Great-Russian, in contradistinction to Little-Russian—as here spoken of—is hemmed in west by the latter idiom, and separated by it from both Magyar and Rumanian. On page 39, Buda is explained to be "the name of one of the parts of Pesth"—an explanation equally uncalled for and incorrect: Buda and Pesth form now one municipality, the capital city Buda-Pesth, but neither is a part of the other, and both may be presumed to be equally well known to readers of so learned a book as the one before us.

Political Recollections: 1840–1872. By George W. Julian. Chicago: Jansen, McClurg & Co. 12mo.

MR. JULIAN was one of the earliest of the anti-slavery men who took the question into politics by the organization of the old "Liberty Party." He was also one of the first who gained a seat in Congress upon anti-slavery issues. He continued an active and honorable career in the Republican party down to 1872, when he supported Mr. Greeley for the Presidency, and has since continued to act with the Democratic party, though he has held no office. His 'Recollections' are therefore confined to the time when he was in close relations with those whom he now opposes, and was among the most unsparing of the denouncers of the principles and policy of those with whom he now fraternizes. The publication of this book is very good evidence, however, that he is not ashamed of his earlier career, and sees little in it to regret or apologize for. A few casual admissions that he was probably led by partisan heat to judge too harshly of some things, are the only indications that he has changed his point of view. This is honorable to him, for it implies that his present political attitude does not seem to him inconsistent with his former one, and that he looks upon the political questions of to-day as so different from those of twenty years ago that party lines cannot be quite the same, or have the same significance.

Mr. Julian was always a man of strong opinions, and has a vigorous and generally clear way of stating them. His loves and his hates were also intense. It is quite natural, therefore, that we should find the story of his personal share in the conflicts of his active career spiced with sketches of his great contemporaries, in which they are painted with the colors they had to him, and not always those in which their own friends would have presented them. It is plain, for instance, that no love was lost between himself and Governor Morton. They had been boys together in the same district school in Indiana, but their friendship turned to rivalry when Julian became an Abolitionist, while Morton grew into a Democratic politician. Morton was never thoroughly "reconstructed" in his eyes, or, if so, it was but a short time before Julian himself learned to look upon the work of the Republican party as done. Morton's hostility within the party was hardly less galling than his opposition when they were in rival camps. The picture of the "great war Governor" is not unfairly drawn, and will be of use in helping the reader to form a true conception of the man who is placed by his friends almost too high for frail humanity.

Interesting incidents concerning Lincoln, Thaddeus Stevens, Stanton, Chase, and other contemporaries are pleasantly told, and are worth a place in the literature of the time. The judgment of history will hardly give Mr. Julian credit for the sagacity and leadership which he perhaps feels should be accorded him; but his book will be found a useful narrative of the personal experience of a public man with just claims to considerable prominence. It sometimes tries too much to be a history, and so loses something of the zest of autobiography without grasping questions and events with the strength which real history demands. The line may not be easy to draw, but the reader becomes conscious at times of the treatment being something short of either style of writing. A fuller stock of personal incident might easily have been gathered, as it strikes us, and the work would have been improved by it. The history would then be chiefly the assumed thread on which the narrative would be strung, and we should not have the sense of disappointment that we have mentioned at finding the historical questions unsatisfactorily discussed.

Index Canonum, the Greek Text, an English Translation, and a Complete Digest of the Entire Code of Canon Law of the Undivided Primitive Church. Second edition, revised and enlarged; with a Dissertation on the Seventh Canon of Ephesus and the Chalcedonian Decree of Doctrinal Liberty. By John Fulton, D.D., LL.D., etc. New York: E. & J. B. Young & Co. 1883. 1 vol. 8vo.

IT is creditable to American theological scholarship that so learned and purely technical a work as this should have been called to a second edition. Yet we cannot but regret that the peculiar views of the author should have forced him to limit its usefulness by restricting it to those councils of the early Church which he regards as having been rendered binding on the whole body of Christians by the decrees of Chalcedon. The distinction practically is factitious. The canons of Ancyra, Neo-Cæsarea, Gangra, Antioch, and Laodicea, which he admits, were never respected by the Latin Church when it chose to disregard them; while the proceedings of the local councils of Africa and of the West, which he excludes, are quite as interesting as the others in the light which they shed upon the organization and customs of the Church. No student can obtain an acquaintance with the development of doctrine and practice without an attentive study of the whole; and if Dr. Fulton had extended his scope to that of the excellent and convenient manual of Bruns—'Canones Apostolorum et Conciliorum Sæcc. iv.–vii.'—with an alphabetical digest of subjects on the same admirable plan which he has applied to his more limited selection, he would have performed a work which would have entitled him to the thanks of all scholars.

From this larger enterprise, however, he is excluded by the very object and purport of the work, which seems, from his Preface, to be the proving that all the subtleties of orthodox theology are useless; that the definitions of the really œcumenical councils—the only ones under the undisputed guidance of the Holy Ghost—concerned themselves alone with the nature and divinity of Christ; that, consequently, this is the only tenet necessary to salvation in Christ, and, therefore, that the largest liberty of conscience and freedom of thought may be safely enjoyed by Christians who hold to the Nicæno-Constantinopolitan symbol, difference of views upon all else being comparatively unimportant (pp. xxi.-vi.). So far as it goes, Dr. Fulton's object is a most praiseworthy one, and if he could persuade the churches to adopt it the world would be spared much objurgation and unseemly consigning of fellow-Christians to the bottomless pit. Yet it is not easy for a layman to enter into the frame of mind which enables a theologian to decide in detail what was meant by Christ's promises that the gates of hell should not prevail against His Church, and that he would send the Holy Ghost to guide His Church unto all truth (pp. xii., xiii.). The latter promise, especially, would appear to be so general in its character, that it seems rather a begging of the question to decide *ex cathedra* that it did not refer to historical truth, or scientific truth, or truth about the creation, or even truth about the authorship of the canon of Scripture; and it is, perhaps, an abuse of the argument by exclusion when we are gravely assured that it is thus proved that the definitions of faith by the General Councils are not merely the absolute truth, but the whole truth.

Neither can we exactly share Dr. Fulton's pious exultation when he contemplates the wisdom of Providence in divinely preserving the Catholic Church from all doctrinal aberrations by preventing the holding of any real General Council since the Third of Constantinople, and thus precluding any definitions of faith, since the seventh century, by an authoritative body acting under the guidance of the Holy Ghost. To use his own words (p. xxi.): "The way in which the providence of God actually *has* saved the Church has been by suffering the holding of General Councils to become impossible. Thus the wrath and sinfulness of men has been made to subserve the safety of the Church." This new utility of schism and error is well worth recognition, but perhaps the innumerable multitude of souls which have incurred perdition through this schism and error would have preferred to be preserved from it by occasional General Councils, which, under the operation of the Holy Ghost, could certainly not have imperilled the safety of the Church. In fact, it is not easy to determine in what consists this saving of the Church, or how it has enured to the salvation of mankind. There appears to be some mysterious entity, known as "the Catholic Church," which "alone hath not erred, but hath been wonderfully saved from error." This, as well as we can make out, consists of the whole body of Christians; but in this case the whole is not the sum of its parts, for all its parts have erred, and thus have not been saved from error—"as the Churches of Jerusalem, Alexandria, and Antioch have erred, so also the Church of Rome hath erred, and the Church of England hath erred."

We part from Dr. Fulton with the sincerest respect for his learning, and for the objects to which he devotes that learning, but we greatly fear that his methods savor too much of the sixteenth century to produce their wished-for effect upon generations that have so far outgrown them. It will require other arguments than his to reunite

jarring sects, and to bring about the reconciliation of science with religion.

The Prometheus Bound of Æschylus; with Notes and an Introduction by R. H. Mather, of Amherst College. Boston: John Allyn. 1883.

MAKERS of classical text-books are prone to forget the important difference between what belongs in the text-book and what should be reserved for the class-room—between what a student should have before him as he prepares his lesson, and what should be used to quicken his wits and broaden his views after the lesson has been prepared. Many editors put into their notes all that they have found useful in their own instruction. The answer to every question is given before it is raised, the clue to every difficulty is offered to the student before he appreciates the difficulty, and the appropriate illustration is presented before his appetite is awakened. His wits and his judgment are not properly trained.

Elementary text-books have long been of the character which has been described. In order to meet the wants of young men who are preparing themselves for college, most of the common editions of the 'Anabasis' of Xenophon are arranged with full grammatical references and notes to explain all but the simplest constructions. They are a system to teach "Greek without a master." This is a great injury to the preparatory schools. Methods have improved of late years, but there is far too much reciting and not enough teaching. Boys go to college without knowing how to attack a difficult sentence in Greek or Latin. Their commentaries have rendered it unnecessary for their teachers to instruct them in methods. It is much as it would be if mathematical problems were furnished with notes referring to this and that principle and rule which had been already stated, in order to enable every careful student to solve each problem without the teacher's aid. Such text-books make possible what is known as a brilliant recitation—a fluent translation and ready answers to all ordinary questions. They are popular with teachers and pupils. They reduce the mental exertion and mental gymnastics to a minimum. The effort of conducting a recitation where one of these books is used, is far less than that of leading the class on from principle to principle by the Socratic method, until the solution of the difficulty is evident. The books are sometimes made so perfect as to kill the recitation. Few teachers can add to the notes more than gleanings of wisdom. Cramming upon the notes is the sole end of work, in some cases. The recitation is made a mere examination to make sure that the notes have been carefully studied. It is considered warm praise of a text-book to say that it has brought the work within the comprehension of a learner; but this is the teacher's business, not the editor's. The editor should simply prepare the way for the teacher. Most of our college students have competent teachers in Latin and Greek, and the less experienced teachers are the very men whose instruction is most deadened by too full information in the notes.

A typical example of exuberant text-books is the handsome volume before us, filled with matter with which teachers have been wont to interest their classes. The class-room origin of the work is manifest on every page in chatty sentences and fervid eloquence. We can imagine the quiet, appreciative smile of the class which would greet the remark (when the ocean nymphs say that they have put away shamefaced modesty to visit the fettered Titan), that "this training by Oceanus of his children to be retiring and respectful is quite in contrast with certain modern manners of the young"; and when, in another place, on v. 560, he would tell them that in later ages in Greece the Homeric custom of buying wives was reversed. "In fact, parents were so anxious to dispose of their daughters that suitors advanced in years were quite acceptable." Such remarks and side-hits at the modern generation are unappreciated in the quiet of a boy's study.

The book evidently is intended to be a repertorium of our elementary knowledge of this play. The editor is over-anxious to say all that can be said, to leave nothing for the teacher to do. This is not only an error in itself, according to our view, but it leads him to fields with which he seems to be unacquainted. *E. g.*, early in the play Zeus is called by Æschylus the new *prytanis* of the gods. This prompts a note which tells us about the prytanes at Athens (including some details which rested on the weakest foundation and were refuted long ago), not considering that Zeus is represented not as one of a college of officers like those of Athens, but as ruling alone as the prytanis did in other Greek cities, of which the note does not afford a hint. A more striking example of the working of the editor's method is where the Titan Prometheus, hated by the gods and bound in an untrodden wilderness, far from the race of men which he has befriended, calls upon the elements—the "swift-winged breezes," the "many-twinkling smile of ocean," and the "all-seeing orb of the sun"—to behold his wrongs. This mention of the sun suggests to Professor Mather a note on sun worship, and next on the colossal statue of the sun-god at Rhodes, which he says was 70 feet (*sic*, for *cubits*) high and "bestrode the harbor." By the shades of Lysippus and Chares, in what attitude did the editor conceive that statue of Helios? The entrance to the harbor is something over 600 feet wide at the narrowest place, and a statue 70 or even 105 feet high could hardly bestride it and preserve the grace and dignity of the sun-god. A little more vivid imagination in this case would have supplied the lack of the learning which we expect. It is almost unnecessary to add that no ancient authority countenances Professor Mather's extraordinary statement.

In general, the editor's knowledge of antiquities seems very superficial. He says that Argus was "probably represented as a herdsman with form only dimly visible to the audience." How that would be possible in the clear light of the Athenian stage it is not easy to understand. The introduction is filled with matter which strikes us as so strange that we wonder whether the author has not received a special revelation, on gold plates, concerning the Greek theatre. But we find that most of the novelties are crudities or long-exploded fancies. To say that it was Æschylus who "made the rude chorus quiet and refined, and in place of their boisterous, extempore effusions taught them regular dances and wonderful poetry," is to forget Alcman, Stesichorus, Simonides, and the rest. The statement that "in Greece no play was given till it had met the approval of a select body of critics" is unsupported. That certain *cunei* of the theatre were "especially assigned" to women seems to be borrowed from an old edition of Becker's 'Charicles'; it was refuted in 1848. That a particular spot in the centre of the stage "was raised, and was used in the most important recitative passages," is contrary to reason, and has no support from ancient or modern authorities. That the "thymele was of square form, raised as high as the stage," was rendered improbable when the ruins of the great theatre at Athens were uncovered, in 1862. The editor seems to have learned little from the excavation of this theatre, as he knows nothing of the excavations at Dodona.

Of new interpretations there are but few. This is perhaps no loss if others were to be like that of v. 689, where we read: "*keep* (her) *off*. This is addressed to Pro. [*sic*] by the chorus, whose purity is shocked by the story of Io, and they wish to avoid all contact with such an accursed creature." The situation is as follows: Prometheus had been relating to the chorus the woeful fate of Io until they break out, "Hold off," *i. e.*, "Cease thy tale," and then say that they never thought that so strange a story should come to their ears, that such woes should chill their souls. Not a word indicates that their "purity is shocked." The editor elsewhere also foists in a mention of Io's "sin" which is not in the mind of Æschylus.

The editor tells us he has illustrated the play from itself, and yet, when the same or a similar construction is found more than once in the play, instead of referring to these examples he refers to those which are collected in Goodwin's 'Moods and Tenses.' So an unnecessary etymology is repeated on 23 and 395. In spite of the fine rhetoric, the full meaning of the original is not always given in idiomatic English in the translations. Two or three times the editor slips in the meaning of a word. On 452 either the printer or the editor is responsible for a bad mistake in the construction of the Greek. Professor Mather very properly avoids a show of learning, which some have striven to gain by frequent mention of German authorities. The book is intended for the beginner in the study of the Greek drama, and, therefore, avoids the more difficult questions connected with the myth of Prometheus and the arrangement of the trilogy as to which we are told little more than that in the trilogy "the character of Zeus as an all-wise, just, and beneficent father of all must have been clearly portrayed." Most teachers will regret that the book does not contain the fragments, in the Greek and in Cicero's translation, of the 'Prometheus Loosed.'

Recueil de Lettres Allemandes, reproduites en écritures autographiques pour exercer à la lecture des manuscrits allemands. Quatrième édition augmentée, etc. Publié par P. Lévy. Paris: Hachette et Cie.

The German Newspaper Reading Book. Containing extracts from forty newspapers. The orthography revised according to the new rules. Compiled and edited by W. T. Jeffcott and G. J. Tossell. Paris: Hachette & Co.; Boston: Schoenhof. 1883.

THERE is certainly to be no lack of means for introducing the present generation to a knowledge of the modern languages. Among recent works having this aim two publications of Hachette & Co. deserve mention as specimens of practical enterprise. M. Lévy, an inspector general of instruction in modern languages, who has done much for the study of German in French schools by editing and translating the principal German classics of the eighteenth century, has prepared a collection of German letters autographically reproduced, in order to afford opportunity for practice in reading German script. The work contains 295 pages in a great variety of handwriting, embracing 298 letters, many of which are facsimiles of communications from the most familiar names in German literature. Excellent judgment has been displayed in selecting the subject-matter. In the first part of the volume the usual assortment appears of invitations and announcements, epistles of condolence, of inquiry and of apology, which one expects to discover in the complete letter-writer; but many of the originals have become historic.

Among the letters of reproach, for instance, one finds the well-known remonstrance addressed by Klopstock to Goethe in referen..e to the latter's wild career with the Duke in the early days at Weimar, and Goethe's equally well-known incisive reply. The second part contains specimens of commercial letters, circulars, drafts and receipts, while the third part is devoted to military instructions, despatches, and orders of the day. The closing document is a facsimile order signed by the Emperor William! The volume is primarily intended for use in the military school at Saint-Cyr, as a kind of exercise in modern diplomatics; and we can conceive no more ready and agreeable method of familiarizing one's self with the intricacies of German chirography than by the use of M. Lévy's collection, which, so far as we are aware, is unique in variety and extent.

The second work alluded to is intended to acquaint the reader with the vocabulary and style peculiar to current newspaper literature, and forms the companion to a similar work issued recently in French. Originally intended to acquaint the reader with the living language of daily life without the necessity of introducing the obnoxious French novel or the equivocal French journal, the latter publication was found to be so successful that its companion has soon followed. The joint editors are two English scholars. It is a compilation of use to those desiring to enter competitive examinations, as well as to those who wish to become acquainted with the current vocabulary of the press. The style of the extracts is correct if not classic, and the variety is entertaining. Items from *Kladderadatsch*, the *Berliner Wespen*, and other comic sheets, alternate with the more serious contents of the *Kölnische Zeitung* and the *Neue Freie Presse*. Among the topics discussed are Cetewayo's captivity, the Egyptian war, Garfield's assassination, the Panama canal, President Arthur, the Irish troubles, and American strikes. Several pages of well-arranged advertisements conclude the selections.

The Story of My Heart. An Autobiography. By Richard Jefferies, author of 'The Gamekeeper at Home,' etc. Boston: Roberts Bros.

WHAT it has pleased Mr. Jefferies to call "an autobiography" is actually a discussion of problems in psychology, under the guise of a narrative of personal experience. The ordinary reader will hardly follow the passionate subtlety of his arguments, but no one can read without admiration his exquisite descriptions of nature. They have that wonderful accuracy and intimacy of knowledge which made the author's earlier books so remarkable, and they have something more. Choose which we may, the lonely splendor of mid-day on the great downs, or the crowded rush of mid London—"the vortex and whirlpool, the centre of human life today"—they are all, we know not whether to say exalted or illuminated by the intense desire to surprise the secret of Nature, the mystery of life. "Full well aware that all has failed, yet, side by side with the sadness of that knowledge, there lives on in me an unquenchable belief, thought burning like the sun, that there is yet something to be found, something real; something to give each separate personality sunshine and flowers in its own existence now—something to shape this million-handed labor to an end and outcome, leaving accumulated sunshine and flowers to those who shall succeed."

BOOKS OF THE WEEK.

Brehm's Thierleben. Chromo ed. Parts 105-112. B. Westermann & Co.
Caddy, Mrs. Adrian Bright: A Novel. Harper's Franklyn Square Library. 20 cents.
Carrol, L. Rhyme? and Reason? Macmillan & Co. $1 50.
Christmas Folio: Music. Richard S. Saalfield. 50 cents.
Claretie, J. French Celebrities. Part II. Funk & Wagnalls. 15 cents.
Edward, Cardinal Archbishop H. The Eternal Priesthood. Baltimore: John Murphy & Co.
Encyclopædia Britannica. Vols. xv., xvi. Charles Scribner's Sons.
Genung, J. F. Tennyson's In Memoriam, its Purpose and its Structure: a Study. Boston: Houghton, Mifflin & Co. $1 25.
Goldsmid, E. Bibliotheca Curiosa. An Account of King Charles the Second's escape from Worcester. From the Pepys MSS. Edinburgh: Privately Printed.
Greenwood, Grace. Queen Victoria. Her Girlhood and Womanhood. Illustrated. John R. Anderson and Henry S. Allen.
Halévy, L. L'Abbé Constantin. W. R. Jenkins. 60 cents.
Koestlin, J. Life of Luther. Illustrated. Charles Scribner's Sons. $2.50.
Lawson, J. D. The Law of Expert and Opinion Evidence Reduced to Rules. St. Louis: F. H. Thomas & Co.
Lacy, W. M. An Examination of the Philosophy of the Unknowable, as Expounded by Herbert Spencer. Philadelphia: Benjamin F. Lacy.
Linton-Stoddard. English Verse: Dramatic Scenes and Characters; Translations; Ballads and Romances. 2 vols. Charles Scribner's Sons. $1.00.
Lorne, Marquis of. Memories of Canada and Scotland: Speeches and Verses. Montreal: Dawson Brothers.
Lowe, Martha P. Memoir of Charles Lowe. Boston: Cupples, Upham & Co.
Maudsley, Dr. H. Body and Will: an Essay Concerning Will in its Metaphysical, Physiological, and Pathological Aspects. D. Appleton & Co.
Metz, Prof. V. de. Hand-Book of Modern Palmistry. Thompson & Moreau.
Nabuco, J. O Abolicionismo. London: Abraham Kingdon.
Oberholtzer, Mrs. S. L. Hope's Heart Bells: a Romance. Philadelphia: J. B. Lippincott & Co. $1 25.
One of the Shepherds of Bethlehem. A Poem. Pittsfield, Mass.: J. B. Harrison.
Otis, J. Raising the *Pearl*: a Story. Harper & Brothers. $1.
"Ouida." Frescoes, etc.: Dramatic Sketches. Philadelphia: J. B. Lippincott & Co. $1.25.
Owen, N. Her Second Love. Philadelphia: T. B. Peterson & Brothers. $1.00.
Peterson, Dr. F. Poems and Swedish Translations. Buffalo: Peter Paul & Bro. $1 50.
Reiss and Stübel. The Necropolis of Ancon in Peru. Part 9. Dodd, Mead & Co. $7 50.
Ritter, F. L. Music in England. Charles Scribner's Sons. $1.50.
Ritter, F. L. Music in America. Charles Scribner's sons. $2.00.
Rolfe, W. J. Shakspere's Tragedy of Titus Andronicus. Harper & Brothers.
Ruskin, J. Dust of Gold. Ashestiel. [For Clavigera; new series.] John Wiley & Sons. 10 cents each.
Scott, Sir Walter. The Surgeon's Daughter. Philadelphia. T. B. Peterson & Brothers. 50 cents.
Scribner, G. H. Where Did Life Begin? Charles Scribner's Sons. $1 25.
Seyppel, C. M. Er, Sie, Es. 4to. Ægyptische Humoreske. Düsseldorf: Felix Bagel.
Skelding, Susie B. Maple Leaves and Golden Rod. White, Stokes & Allen. $1.50.
Skelding, Susie B. Songs of Flowers. White, Stokes & Allen. $1.50
Souvenirs d'Amérique et de France. Par un Créole. Paris: Bourgt Calet & New York: F. W. Christern.
Stewart, Mrs. G. E. The Burnhams: a Novel. G. W. Carleton & Co.
Thiessant, P. D. de. De l'Origine des Indiens du Nouveau-Monde et de leur Civilisation. Paris: Ernest Leroux.
Thomas, Annie. Jenifer: a Novel. Harper & Brothers. 20 cents.
Townsend, Gen. E. D. Anecdotes of the Civil War in the United States. D. Appleton & Co.
